Subscription price of the N. E. L. A. BULLETIN, in United States, is $3.00 per year to members and non-members. Half price to colleges and libraries. Single copies, 25 cents. Foreign subscriptions, $4.00 per year to non-members.

Orders should be made direct to the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

The closing date for the N. E. L. A. BULLETIN is the fifteenth of the month preceding the month of issue. Material intended for publication must be in the hands of the editor by that date to insure publication the following month.

Manuscripts and correspondence relating to the N. E. L. A. BULLETIN should be addressed to the Editor, N. E. L. A. BULLETIN, 420 Lexington Ave., New York, N. Y.

The National Electric Light Association does not assume responsibility for nor necessarily endorse, or approve, statements made by individual contributors.

Code address of the National Electric Light Association is "Nelap," Bentley's code.

For the convenience of members arriving in New York after office hours or on legal holidays, the following telephone numbers connect with N.E.L.A. headquarters office:

Lexington	3300 3301 3302	Paul S. Clapp A. Jackson Marshall
Lexington	8592	George F. Oxley
Lexington	3310	Fred W. Herbert
Lexington	5059	C. E. Greenwood
Legington	3311	E. H. Greenwood
Lexington	5035	J. O'R. Coleman and Engineering Department
Lexington	3312	Editorial Department

Preston S. Arkwright

THE job of being president of the National Electric Light Association is no easy one, for the Association is an organization which makes many and arduous demands upon its leader. To fill the office worthily requires all the characteristics of integrity, leadership and initiative which are associated with successful men of affairs, plus a profound knowledge of the electrical industry, an intimate understanding of the Association, its works and possibilities, and a humanitarian outlook upon life.

The Association is mindful of the high position of its president and is jealous to see that none unworthy in personal characteristics or unproved in highest executive ability attains to it. No greater praise could be offered a man than to say he has served the Association according to his best abilities. This, Preston S. Arkwright has done during the past year, adding, by his brilliant administration, lustre to the highest traditions of a line of notable predecessors.

A Constructive Move

WITH minor exceptions, each kilowatt hour sold is conducted to its point of ultimate utilization by means of circuits that are governed as to their type and quality, and therefore their cost, by the National Electrical Codes and the municipal ordinances on house wiring. Adequate wiring, adequately laid out upon sound commercial and engineering principles is indispensable for the development of the load densities clearly dictated by modern practice. It is equally indispensable that the development of this link in the chain of supply shall not be hampered by other considerations than the necessary provisions for safety in order that the whole industry may profit, not only by the full utilization of all existing means for promoting complete wiring, but also by the prompt utilization of all meritorious improvements in the art.

As a part of this general constructive program which must inevitably benefit all elements of the electrical industry, the member companies of the Association have realized that it is incumbent upon them to undertake a positive and constructive part in the formulation of the codes governing house wiring where before their interest had been rather passive than active. The organization of a corps of direct representatives of member companies is an important element in this participation which will provide a channel for the direct transmission of the views and the necessities of operating companies, as an adjunct to the ordinary channels of committee procedure. The latter, as in the past, are charged with the responsibility for the more deliberate formulation of Association policies. The corps of company code representatives, moreover, is already proving to be an efficient agency for the collection of field data, and as code provisions should normally be based upon actual experience, this function will prove to be a most important one.

The Professional Motive

MEN everywhere, who are in positions of leadership, have come to make their ideal greater than themselves. It is a question with them of what is right, what will contribute most to the permanent welfare of the community. There are exceptions, of course, but if you look at the truly great leaders, you will find their goal has absorbed even their interest in themselves. Thomas Edison long ago forgot self in the pioneering efforts which absorbed his life.

Great problems confront them and press for solution on every hand. An individual may want to contribute the maximum service, to do what is right, but the decision calls for rare judgment.

* * *

The professional motive is something bigger than the individual who possesses it, something outside of him, which takes possession of him, absorbs him in its inspiration. He acts freely, not under compulsion as a slave or man with a vicious habit. He willingly and gladly stakes his property and his comfort. It caused a brilliant medical man to spend his life among the Kentucky mountaineers in comparative poverty; it caused a business man to give up a splendid position to become a college administrator; it caused a man like Munsey to culminate his life by giving his millions to art; and it has caused many a man so to devote himself to his business, so to apply his energies, as to fulfill his dream of a business of maximum service to the community. The sporting element is always present. The professional motive does not calculate, does not weigh chances and risks like a book-maker at a race, or a cock fight. The professional man plants his feet upon a law of the universe, a great ideal, and defies chance, accident and fate.

* * *

Charles W. Eliot, one of America's keenest observers of human nature, one time wrote: "The gypsy in Asia Minor makes iron nails one at a time with hammer on an anvil, much as his ancestors did before him for hundreds of years. I have seen him doing it; but I also observed that his small children were stark naked and that his larger ones had only one garment. . . . In industry and commerce all things are become new."

The one tradition which we should hold inviolable is the tradition of constant change. It will inevitably lead in the great industry which you represent, to the adoption of a professional motive on the part of your leaders—a motive which will still further develop your service, and aid in raising the level of our nation.—Deane W. Malott.

MATTHEW S. SLOAN
President-Elect, National Electric Light Association

N·E·L·A·
BULLETIN

June, 1929 Vol. XVI No. 6

N.E.L.A.'s Greatest Convention

THE dedication ceremonies of the new Atlantic City Auditorium held on Friday, May 31, and at which the principal speaker was the vice-president of the United States, opened the exhibition held in conjunction with the fifty-second convention of the Association. From this time until the following Friday when the convention closed with the election of Matthew S. Sloan as president of the Association for the ensuing year, Atlantic City was host to the greatest gathering of public utility representatives ever held in America.

All expectations for the convention were more than justified, President Arkwright and the members of the several committees responsible for the functioning of the convention and exhibition were assured both by the declaration and the attitude of the twelve thousand delegates and guests. The attendance even exceeded the liberal guess of Secretary of the Association Marshall when ordering convention badges, as it was necessary before the convention closed to issue to the delegates badges left over from previous years.

The convention would have been notable in and for itself alone, but the heart-moving tributes, both formal and spontaneous, paid to the Great Electrician made of it one that will ever be remembered as a golden page in the book of the industry's history by those fortunate enough to attend.

Like a musical theme, running through the whole convention was the voiced recognition of Mr. Edison as the founder of the present-day electrical industry, the recognition including, of course, as a theme must have an accompaniment, those who pioneered with him and those who, following in their footsteps, have aided in building the industry.

The colossal new auditorium proved ideal for the holding of a convention of the magnitude of this one.

OFFICERS
of the
ASSOCIATION
1929-1930

President, **M. S. SLOAN**
The New York Edison Co., New York, N. Y.

Vice-President, **W. A. JONES**
Henry L. Doherty & Co., New York, N. Y.

Vice-President, **J. F. OWENS**
Oklahoma Gas & Electric Company
Oklahoma, Okla.

Vice-President, **MARSHALL E. SAMPSELL**
Central Illinois Public Service Co., Chicago, Ill.

Vice-President, **EDWIN GRUHL**
North American Co., New York, N. Y.

Treasurer, **P. S. YOUNG**
Public Service Electric & Gas Co., Newark, N. J.

Managing Director, **PAUL S. CLAPP**
National Electric Light Association, New York, N. Y.

Secretary, **A. JACKSON MARSHALL**
National Electric Light Association, New York, N. Y.

At night the beautiful and fantastic lighting of buildings, streets, boardwalk, beach and sky produced a picture that seemed a combination of the Aurora Borealis and an artist's dream.

The business sessions, at which were discussed the subjects of most immediate interest to the industry, and which will be recorded in some detail later, were exceptionally well attended, every session attracting a crowded house.

The exhibition, with displays by more than 200 manufacturers of electrical apparatus and equipment, was considerably larger than any previous one and attracted much attention from all delegates.

The carnival spirit manifest in the entertainment periods showed plainly that these features were thoroughly enjoyed. Professional entertainers, including Frieda Hempel, Albert Spaulding, Helen Morgan, Julia Sanderson, Frank Crummit, and, throughout the convention, B. A. Rolfe and his orchestra, afforded delight to lovers of music and song.

The reception and ball given Monday night, June 3, in honor of President Arkwright was a glamorous scene of social festivity.

For the first time at any convention, talking moving pictures supplemented the normal program. Talkies made abroad under the direction of W. H. Onken, Jr., senior editor of the *Electrical World,* especially for this occasion were the subject of much favorable comment. A talking movie of the complete convention was filmed by the Fox Case Corporation and will be showing at N. E. L. A. Geographic Division conventions and elsewhere by the time this issue of the BULLETIN reaches the reader.

Business sessions were simplified considerably over previous conventions. The general adoption by all Sections of the Association of serial reports of their activities, which appear throughout the year, eliminated the necessity of committee reports at the convention. The time heretofore given over to such reports was filled by speakers of leadership in many fields. Some of the addresses and reports made at the convention are reproduced in full in this issue. Others will appear in the next and succeeding issues.

First General Session

IN opening the first general session the morning of June 4, Preston S. Arkwright, president of the association, struck the keynote of the convention when he urged that all in the electric light and power industry accept Mr. Edison's example of patience, persistence and whole-hearted devotion to an idea as the ideal of what the industry should strive for in its dealings with the public. He urged even greater cooperation toward the solution of common problems than there has been in the past, to the end that the United States may continue to lead the world in the production and use of electrical energy. He pointed out that this nation produces and uses as much electrical energy as all the other nations in the world; that the rate of extension of electrification in this country is continuously accelerating, and that the potential market ahead is many times greater than that already developed.

Mr. Arkwright urged tolerance, but firmness of purpose, in dealing with critics; careful introspection as to motives and methods of development, and then aggressive progression along lines determined to be right and for the best interests of the public and the investors in the industry, and concentration of effort of the best minds of the industry in solving some of the present problems confronting the industry, followed by united expenditure of energy in carrying out decisions reached.

The financial affairs of the Association were discussed by Treasurer P. S. Young, who reported everything in excellent condition.

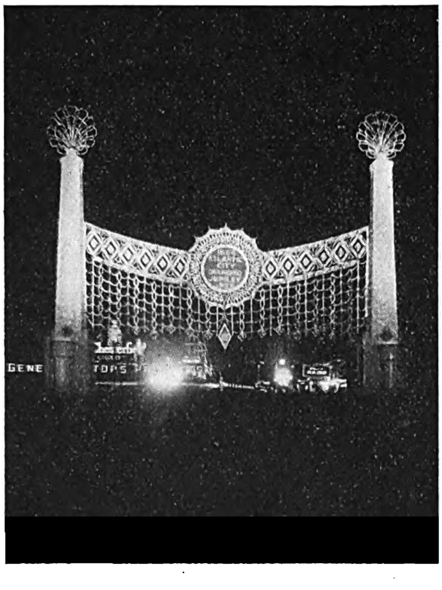
Referring to the year's progress in the electrical industry, Paul S. Clapp, managing director of the Association, said that energy used in the home has increased 15 per cent. More than a million new users were enrolled during the year. There has been an increase of 7 per cent during the period in the energy consumed by the average user, Mr. Clapp asserted, but incidentally the average amount paid has increased only 3 per cent.

With regard to the Federal Trade Commission investigation, Mr. Clapp said:

"During the year the National Electric Light Association has been under intensive federal investigation. In accordance with the policy indicated by the officers of the Association, our attitude has been one of complete cooperation with the government. Various representatives of the Federal Trade Commission have made repeated visits of varying lengths to our headquarters offices. All accounts reaching back ten years have been scrutinized in detail several times. Each voucher has been critically reviewed. Indices of the complete files were furnished and investigators were given prompt and complete access to every file requested. Requests for specific information and voluminous copies of material were complied with. Members of the staff have testified in Washington frankly, completely and often."

J. F. Owens, chairman of the Public Relations National Section, spoke of the Federal Trade Commission investigation and the newspaper discussion and editorial comment on the activities of some of the committees of the section.

In concluding his report, Mr. Owens said: "The accomplishments of the past are but an index to what the accomplishments of the future may be. Our industry will continue to be a constructive force in the life of the nation only as we deserve it. It will be stable only as we are right. Being right, as I believe the industry is, as nearly as it is possible for any human agency to be right, let us not hesitate to continue to give to those for whom we are trustees of a very important service, an account of our stewardship. Let us continue to fight for what we believe to be in the best interest of the American people. Let us not stoop to pettiness. Let us not sully our great industry by deeds that will not bear the searching light of day. The record of our accomplishments reveals the contribution to society and the race to be too valuable to need anything but straightfordwardness to insure lasting prosperity of the electrical industry."



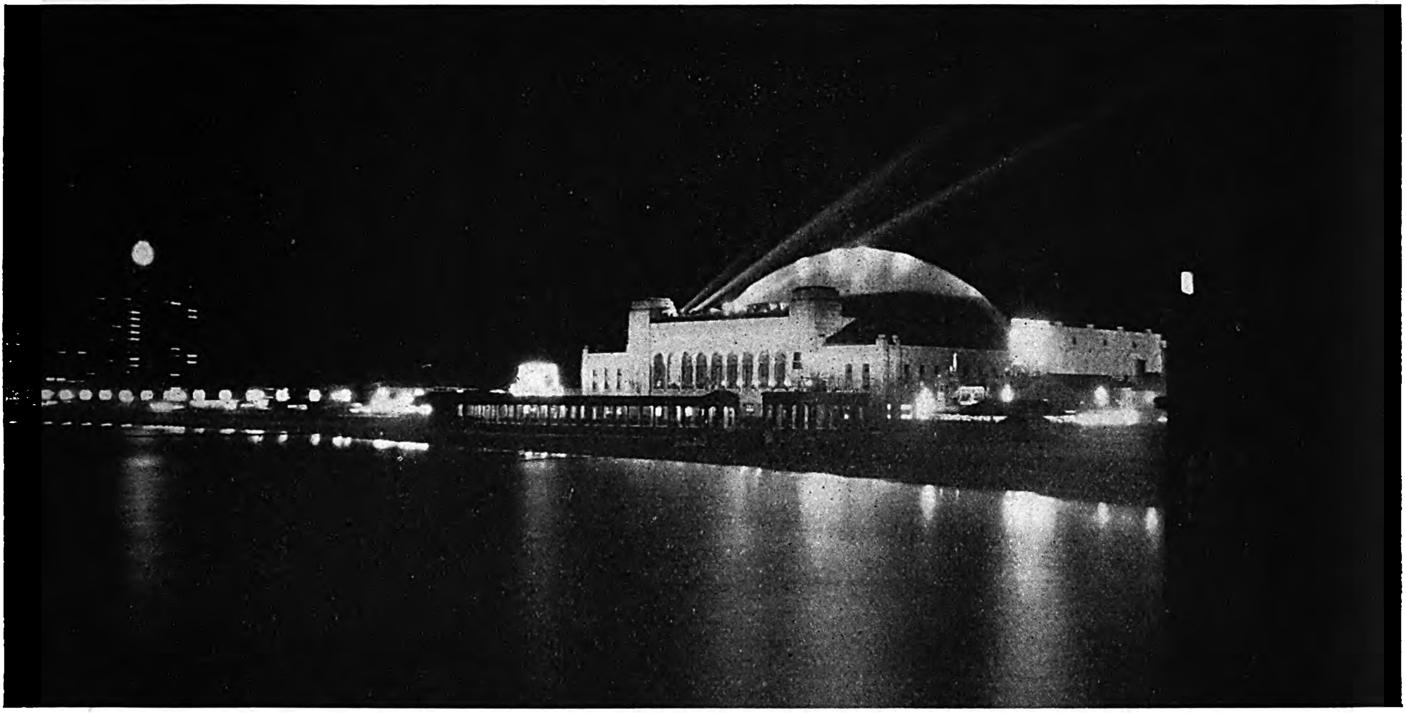
A most interesting incident of the session was the appearance of a disguished Englishman—Sir Ernest Benn—through the medium of a talking movie taken at his country home near London. Sir Ernest is a noted economist and publisher and, as he could not be present at the convention in person, a sound motion picture film of his greetings to the National Electric Light Association was taken and sent to Atlantic City.

Discussing the public right as to electric rates, ex-Justice William L. Ransom, of New York City, urged revision downward of residential rates. He said that "there are signs of a growing public consciousness as to electric rates, their forms, and their economic consequences as limitations on the service which electrical energy may render," and voiced the opinion that "it is fitting that in this representative association of the industry an effort shall be made to perceive what the public has a right to expect as to the rates which it pays."

According to Judge Ransom, "it clearly appears that the present barrier to electricity's full service in the home and in industry lies in the forms of rates. If the present rate structure makes a home-owner pay an average of six or seven cents a kilowatt hour for a relatively small quantity of energy, whereas he would be glad to use a much larger quantity for a variety of labor-saving uses, for which he could afford to pay an average of three cents, the rate schedule must be seriously at fault, providing the company could well afford to supply him the larger quantity of energy at the price he could afford to pay."

Speaking on the subject of present-day sales policies of the light and power companies, A. W. Robertson, chairman of the board of the Westinghouse Electric and Manufacturing Company, said that the record of progress of the electrical industry is "one of the proudest to which any industry can point, and it explains why the nefarious propaganda of a few people has been unable to disturb the prosperity and steady growth of the power companies."

He emphasized the responsibilities of the industry to the American people and dealt with the importance of satisfactory electric appliances. These appliances, he insisted, must be economical, convenient, serviceable and fool-proof so that they may be used frequently and without danger. He concluded with a plea for only standard, high grade appliances, saying that the use of right appliances as against unreliable devices should be encouraged in every possible way.



A Gorgeous Spectacle—Atlantic City Auditorium Floodlighted for the Convention

Second General Session

TAKING as his subject "Sales Increase or Rate Increase?" Matthew S. Sloan, President of The New York Edison Company and President-elect of the National Electric Light Association, in an address before the Second General Session said that the light and power industry "is slowly being squeezed between the jaws of a pair of pincers."

One jaw is a decline in the kilowatt-hour sales and in revenue for each dollar of investment, and the other is a rising investment for each kilowatt of installed generating capacity.

Summarizing the situation Mr. Sloan asked the question: "Shall we increase our sales or our rates?", stating that this question is distinctly and sharply pertinent.

"The answer to this question is," he said, "that we must increase our sales. We must sell more kilowatt-hours for each dollar of investment, making our equipment work harder and steadier, and the place to sell more service, in my judgment is in the home."

This session was enlivened by the introduction of greetings from Europe through the medium of a talking movie—this time by His Excellency, Dr. Alberto Pirelli, of Milan, Italy, President of the International Chamber of Commerce.

The investment companies were championed by Marshall E. Sampsell of the Central Illinois Service Company, who said that without their assistance by the purchase of common stock and by the extension of general credit, as well as by management and engineering skill, many operating light and power companies could not keep pace with their rapidly expanding business.

Reporting on the electrification of railroads, Britton I. Budd, chairman of the committee on that subject, stated that there are twenty railroads having some degree of electric operation. The length of route electrified is 1900 miles, and that of all tracks, including yard and side tracks, 4300 miles. The three large electrifications now under way are the Pennsylvania, the Reading and the Lackawanna.

George Gibbs, consulting engineer, of New York, followed Mr. Budd. After reviewing the history of railroad electrification in this country, the progressive steps which are being taken by various railroads to develop heavy electric traction for all kinds of traffic, and the advantages now being secured by some roads by electrification in freight yards for shunting and classification purposes, he said:

"Electric haulage has been tried out for every condition met with on steam railways. It has demonstrated by years of trial that the present development and perfection of apparatus from the power house down to the propelling wheels of the train will produce reliable and useful results from an operating standpoint."

E. C. Stone, chairman of the Engineering National Section, reporting on the activities of the section, urged "more system capacity per dollar of investment." With fuel efficiency at its present high level the cost of generation has become almost a minor item, he said. Discussing the question of electrical hazards in the home, Mr. Stone said that considerable public attention had been called to them, probably because "while such accidents are very few, they are necessarily spectacular in nature when they do occur. Recent statistics of the National Safety Council indicate that the chance of a fatal accident in a home from a fall is sixteen times that from electricity."

P. B. Zimmerman, secretary of the National Food Preservation Council, spoke on the food preservation program. This program has for its objective four major ideas. These are the necessity for keeping food below a certain temperature, the relationship between food spoilage and health, the causes of food decay and bacteria growth, and the vital need for proper all-year-round refrigeration.

General J. J. Carty, vice-president of the American Telephone & Telegraph Company, addressed the session on "Science and Progress in the Industries." He pointed out that the American progress was linked with research and said that "one of the outstanding factors in the success of the light and power industry is its encouragement and support of laboratories for research in applied science.

Third General Session

UNABLE to appear at the Convention, Thomas A. Edison delivered from his home near Fort Myers, Fla., a personal message to a throng that jammed every available inch of space in the mammoth ballroom of the Auditorium. This session was set aside on the program as "Edison Day." Mr. Edison appeared through the medium of a movietone film, which pictured him as strong, active and smiling, and which transmitted his message in a voice, firm and clear to delegates, members and guests of the National Electric Light Association.

John W. Lieb, vice-president and general manager of the New York Edison Company, presided as Honorary Chairman and paid a touching tribute to Mr. Edison. Henry Ford, whose friendship for Mr. Edison has inspired him to a keen personal interest in the collection of electrical apparatus for the Ford Museum of Americana at Dearborn, Mich., and the reproduction there of Menlo Park, the scene of Mr. Edison's work with the incandescent lamp, was introduced at this session by E. Wilbur Rice, honorary chairman of the General Electric Company. Mr. Ford spoke a few words of thanks in appreciation of the applause that greeted his appearance.

Summing up the record of the electrical industry, Thomas N. McCarter, President of the Public Service Corporation of New Jersey, said that "it was conceived and has been developed as a private undertaking. Without the initiative, without the enterprise that comes with private as opposed to Government operation," he continued, "it would never have reached its present stage of usefulness. No Government would, or should, have taken the risks, have incurred the expenses, have suffered the losses, that were necessary to its growth and expansion.

"Nor has the time yet come, nor is it in sight, when the industry can successfully function without the same application of initiative and enterprise to its affairs."

Designating him as New Jersey's most illustrious citizen, Mr. McCarter, after listing a few of the many major industries in which his inventions have played an important part, such as telegraphy, telephony, wireless, radio, motion picture, electric rail transportation and electric light and power, paid a remarkable tribute to Mr. Edison.

Taking as his subject "The Inspiration of a Name," Charles L. Edgar, President of the Edison Electric Illuminating Company of Boston, and one of the early associates of Mr. Edison, told the audience that the illustrious personages whose names have illuminated the pages of history can be classified into two groups.

In the first group he placed such names as Washington and Lincoln—men who have dedicated themselves to the preservation and upbuilding of their country. In the second group he placed those "who have risen to fame through accomplishments which were the result of a thought or an idea originating in each inner consciousness." These he said were "pure individualists who assumed their tasks, not in response to a popular demand for a leader to accomplish some desired result, but inspired only by their own visions."

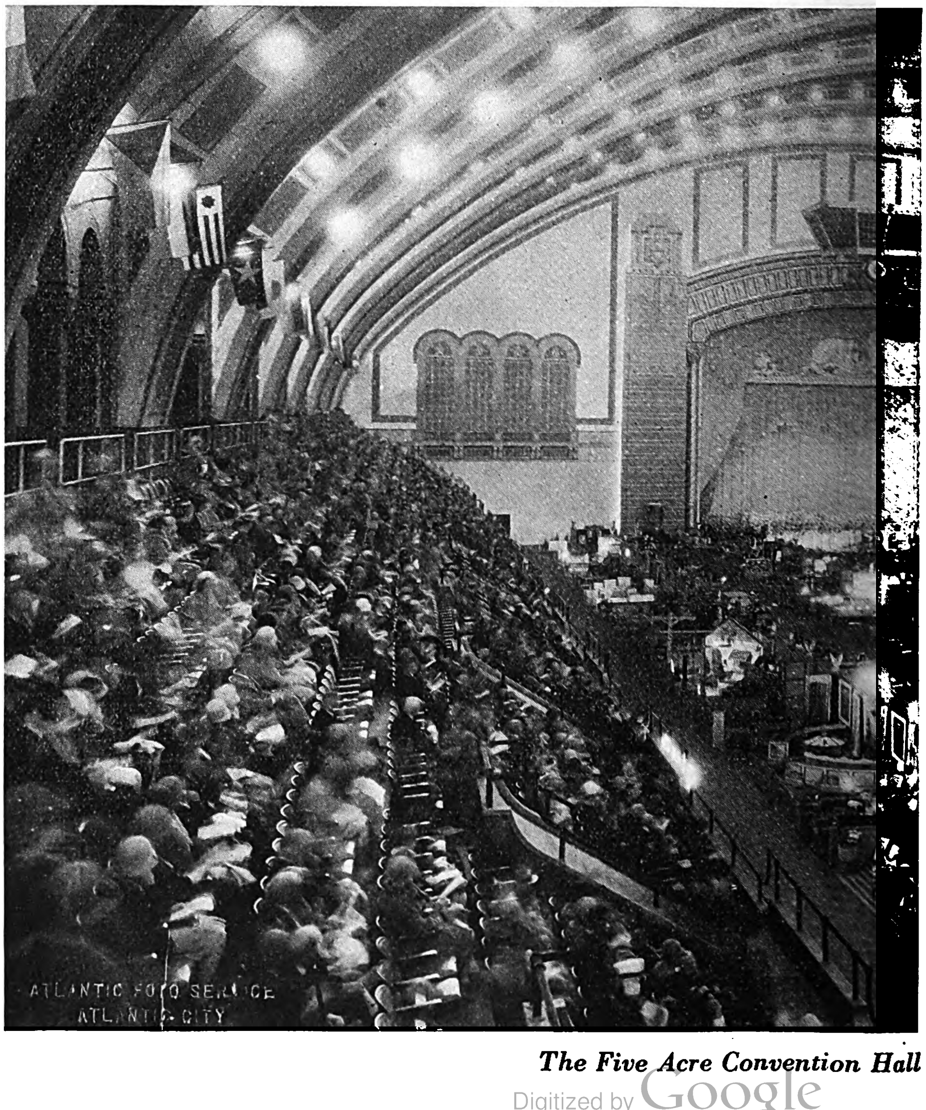
Turning to Mr. Edison as the outstanding personage of this second group, Mr. Edgar said: "It remained for Edison to discover the source from which at his magic touch was created a new sun for a new world, dispelling darkness and bringing added comfort into the homes and revolutionizing the life and methods of a grateful world. For him nature revealed her hidden secrets and through him a new industry sprang into being. After centuries of unconscious waiting the world awoke to realize that the dark watches of the night had wasted away and a new day of light and gladness had dawned for mankind."

Another feature of the program was the presence of Elmer A. Sperry, President of the American Society of Mechanical Engineers, a leading spirit in the organization of the National Electric Light Association in 1885. Mr. Sperry spoke on "The Birth of the Industry," describing the organization of the Association, the many difficulties of the industry during its early days, and the arc light, which was the only form of electric lighting prior to the invention of a practical incandescent lamp and Mr. Edison's system for generating and distributing electricity.

The concluding address of the session, delivered by Berton Braley, the well known author, can only be described as a classic among efforts to express appreciation of an individual and his work.

Taking as his subject "The Lamp of Aladdin," Berton Braley said, "where the slave of Aladdin's lamp might move a palace a thousand miles, the slaves of Edison's lamp have moved civilization forward a thousand years. Where the slave of Aladdin's lamp could heap a horde of gold and jewels before Aladdin's wondering eyes, the slaves of Edison's lamp have created new wealth beyond the wildest dreams of Oriental magnificence, and made of the very earth itself a vast jewel coruscating with multi-colored radiance."

The quest for the Golden Fleece was a mere jaunt by comparison to the search for a fibre that would glow and con-



The Five Acre Convention Hall

tinue to glow after it had burned, according to Mr. Braley. "Finding a needle in a haystack was as easy as finding Cleopatra's needle in Central Park when put beside this job of discovering the fibre for the incandescent lamp," he said.

At the conclusion of his address Mr. Braley said: "Fifty years ago Thomas Aladdin Edison rubbed a lamp and the electrical industry as we know it now was born. Its social, material, industrial and spiritual ramifications, the historian of 3,000 A. D. may possibly be able to estimate, but we cannot. We can count—by mathematics such as only an Einstein might understand — the physical wealth that hangs by the burnt fibre in a vacuum, but even with the aid of calculating machines that think and ledgers that talk, we are probably shy several billions of dollars. Of the other values created by the lamp of Aladdin we can have no approximation. We are in the realm of the Infinite, where the 'blindest bluffs hold good, dear lass, and the wildest tales are true!'

"Let the Bards turn to yesterday for Romance, we know she is with us today and leading us into the bright and brave promise of tomorrow. We recognize her not only when she flashes across the sky with the air-mail, but when she perches in the grimy cab of the coal dumper beside the sooty-faced operator whose levers do the work of a thousand sweating men. She rides on the radio waves, and she runs the washing machine. Her glamor is no less now that she has gone to work than when she sang songs among the sirens as Ulysses passed, bound to his mast. And where once only a few adventurers might follow her fleeting footsteps, the Lamp of Aladdin lights her trail for us all."

Fourth General Session

ONE of the outstanding addresses on Friday at the fourth general session was delivered by John L. Madden, vice-president of the Metropolitan Life Insurance Company. The subject was "Industrial Development in the United States," and it dealt with the results of a field survey conducted in cooperation with the civic development committee.

According to Mr. Madden, "the real industrial development came from new industries started within the communities themselves," the migration of industry being relegated to a much smaller role in economic growth than was expected. Relocations accounted for only 9.4 per cent of the plants gained by the various communities. New industries accounted for 81.8 per cent of the plants gained, while branch plants accounted for the remainder of 8.8 per cent.

During the period surveyed, 5908 plants were lost to American cities. About 18 per cent of these moved away, while the remaining 82 per cent went out of business. The total number of plants lost was about 60 per cent of plants gained.

Arbitrarily taking a population of 50,000 as a dividing line between larger and smaller cities, Mr. Madden said that "we find that the branches and relocations were divided nearly equally between these two types of cities, but that approximately three-fourths of the local plants were established in the larger cities. All types established in the larger cities accounted for 58.4 per cent of the total gains in employment reported in the survey."

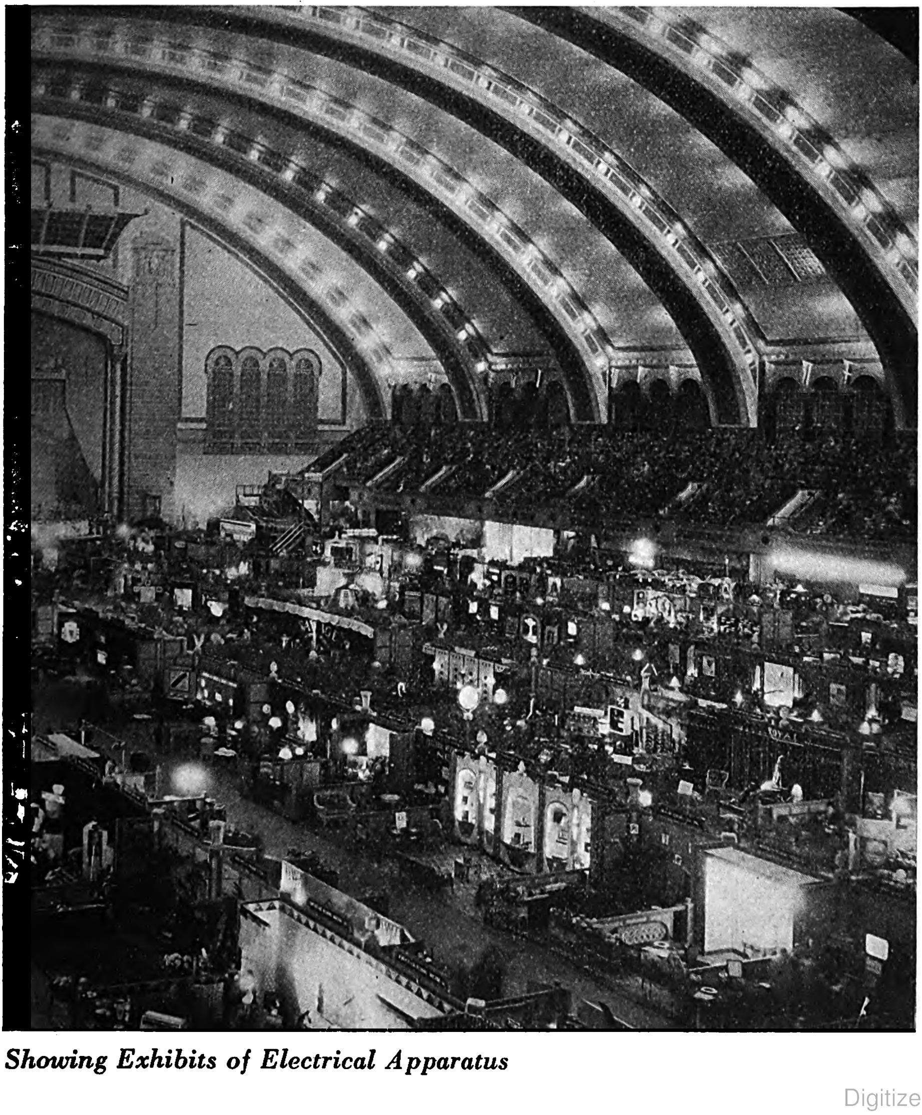
The larger cities of 50,000 population and over received 54 per cent of the plants employing 100 or more workers, whereas the smaller cities received the remaining 46 per cent of these larger plants, more than one-half of which are in cities of less than 10,000 population.

Discussing the reasons underlying the location of plants, Mr. Madden said that "markets are advanced most frequently as the reason for location of plants. The business man," he continued, "who has tuned in his sales practices to the high demand of his consumers is naturally going to consider the location of new plants in relation to his marketing program."

J. F. Ford, chairman of the Accounting National Section, reported on the activities of this section. He dwelt on the effective development of accounting methods and traced the trends that are leading the accountants toward a broad and very fundamental functional position in the industry. The scope of their work calls for a complete business man, and they cooperate with those in charge of all departments.

Sir Kengo Mori of Tokyo, Japan, paid tribute to the genius of Thomas A. Edison and his electric incandescent lamp through a "movietone" film. One thought expressed by him was: "An invention whose advantages can be enjoyed by only one section of the community, or the people of only one country, cannot be termed a true blessing. But the electric lamp is a true blessing in the sense that its beneficence extends to every man, every woman, the world over."

"The cost of producing and distribut-



Showing Exhibits of Electrical Apparatus ing electrical energy has been greatly reduced," said William J. Hagenah, vice-president of the Byllesby Engineering and Management Corporation, in his address on "Regulation." The reasons for the lower costs, he explained have been the remarkable progress made in the electrical industry by the building of vastly larger and more efficient units of production, the greater productivity of labor per unit of effort, the interconnection of utilities and the increased economy of operation and efficiency of management made possible by the holding company and the management company.

"The great savings," he continued, "that have resulted from inventions, improvements in technical processes and efficiency in management have been transmitted to the public through the constant downward revision of rates. The profits have not been retained by the utilities, for at no time have the state regulatory commissions permitted rates that yielded an unreasonable return on the fair value of the properties. The influence of the state commissions has always been present, both in formal and informal negotiations, carrying out the spirit of the utility laws. Every saving by the utilities, almost as soon as it was accomplished, has been passed on through lower rates to the customers for service. During this same period private industry, limited only, by the restraints of competitive business, not only advanced prices violently, but has generally maintained them at a level far in excess of pre-war prices."

Another speaker at this meeting was J. R. Howard, past president American Farm Bureau Federation, who dwelt on the progress and problems of rural electrification. He urged progress and pointed out the national importance of this work. B. F. Weadock, special counsel, reported on his work with the Federal Trade Commission, and W. H. Onken, Jr., senior editor *Electrical World,* presented the memorial address.

The Convention formally closed with the election of Matthew S. Sloan as President for the ensuing administrative year, and Edwin Gruhl of the North American Company as Vice-president.

National Sections and Public Policy Sessions

Public Policy Session

FEATURED by an address by Julius H. Barnes, Chairman of the Board of the U. S. Chamber of Commerce, the public policy session held on the night of June 6, filled to overflowing the great ballroom of the Atlantic City Auditorium.

The Charles A. Coffin award was also made on this occasion and the report of the Public Policy Committee, delivered by W. W. Freeman, vice-chairman of the Committee. Interspersed in the program were recitals by Albert Spalding, violinist and Freda Hempel, soprano of the Metropolitan Grand Opera Company and music by B. A. Rolfe and orchestra.

The inspiring report of the public policy committee contained the fundamental doctrines that have made the industry and laid the planks of its future platform. The able address of Julius H. Barnes, chairman of the board of the United States Chamber of Commerce, gave a picture of all industry and oriented the light and power group in the perspective possible only to a man with the vision and experience of Mr. Barnes.

Mr. Barnes said in part, "Within the past month, the Committee on Recent Economic Changes, under the chairmanship also of Herbert Hoover, recounts the progress of the five intervening years. This report speaks of the rise in the use of power, three and three-quarters time faster than the growth in population. It emphasizes its increasing flexibility which enables it to penetrate every section of the United States, including rural areas. It speaks of the silent revolution by which through power the unskilled worker has become a skilled operator, multiplying his effectiveness. The survey states that, as a nation we now use as much electrical energy as all the rest of the world combined.

"Inevitably we must analyze for ourselves the causes which lie behind preeminence in national progress. There is, then, not disparagement, but inspiration, for ourselves and others, when we find cause and effect securely joined.

"For example, the sixty million horsepower today in America is possible because today seventy-five per cent of America's factories are electrified, while in Great Britain only forty-eight per cent are electrified. With that we find that the relative national wealth of United States and Great Britain runs in exact ratio of the horse-power per capita used in industry, namely 4½ to 1. With that, again, we find as between the United States and Great Britain, we have twice as many owned homes, and one-twentieth as many people per capita on public charity.

"The indicators by which our national income rises in throbbing growth until it approaches an annual one hundred billion dollars of new production, show that American industry, with its power service, increases the volume of things to divide among the homes of America. The evidence in America of equable distribution of these earnings under our political and social system rests on such indicators as its twenty-five million automobiles and its nineteen million telephones. Distinctly, the average of human security is steadily advancing. The congested quarters of our cities today show the universal possession of good shoes and stockings by the children of the tenements. The wage-earner of America today may reasonably aspire to own his flivver and a savings account. The working-girl of America has established the standard of silk as the proper garb for self-supporting womanhood. The poorhouse is today echoing fewer footsteps within its sparsely tenanted halls.

"America's most significant gift to civilization will be by history rated its genius for revolutionary organization of industry. America's title of honor in history will rest upon the rise of average welfare under the earnings of highly organized and power-driven industry, and of a social system which distributes and shares those earnings fairly."

The program was broadcast by more than a score of stations associated with the National Broadcasting Company.

In making the presentation of the Charles A. Coffin medal to the El Paso Electric Company, President S. Arkwright, President of the Association, said of the company: "Despite its comparatively small size, the many limitations and difficulties surrounding its growth, this company has grown, has prospered and has played a part which your commitee feels constitutes a distinguished contribution to the development of light and power for the convenience of the public and the benefit of the industry. The committee hopes this award will be an inspiration to the managers of the smaller companies operating throughout the nation.

"In every field, general administration, commercial activity and engineering, a splendid job has been done by an active, aggressive management. I think it is no exaggeration to say that the fact that this company with notable resolution and tenacity has submitted statements of its accomplishments, has in no small measure helped in making its fine record in all fields."

F. J. Gannon, manager of the El Paso

Electric Company, received the award on behalf of his company.

The report of the Public Policy Commitee was read by W. W. Freeman. It stressed the development of the industry by following sound public service policies. Mr. Freeman declared, "The electrical industry has been progressive; it has not stood still. From the beginning the men responsible for electrical development have realized the enormous contributions in useful service that electricity has made and will continue to make to the whole national and community welfare, to workers and to homes, to all phases of economic and social life. They understand and assume the obligation to unfold the full possibilities of electric service and translate them into everyday use."

The report dwelt on the constructive policy of rural electrification, the policy of economical system building, of rate reductions when justified and other matters of long-tried effectiveness. It told of the co-operative attitude taken by the utilities in the Federal Trade Commission investigation and looked for the result unafraid.

Accounting Session

STATING that the newspapers today are filled with "criticisms and suspicions, and a certain amount of fear, that the electric light and power companies have become a species of diabolical octopus, which will get out of control and choke the very life of the nation," Professor Deane W. Malott, assistant dean of the Harvard Graduate School of Business Administration, in an address on "The Professional Motive in Public Utility Management" before the Accounting National Section expressed the opinion that "it seems unlikely that an industry of such size could have arisen with these as the dominating motives."

Continuing along these lines, he said: "Largely, the development of public utilities has been through the corporation a type of organization which, contrary to popular conception, inevitably tends to higher ethical standards, with more of a feeling of trusteeship for the public which it serves as well as for the employee, and the security holder. The big corporation stands for stability and permanence, rather than for rapid and immediate profits. It is easy for one man, in a little shop around the corner, to engage in sharp practices. It is far different in a corporation where the individual executive is surrounded by associates whose respect and trust are necessary to his existence. For these corporations are no longer controlled by a few men, nor by bankers. The ownership shares are scattered throughout the land, just like automobiles or electric lights."

Describing the public utility laws to which the electrical industry is subject, and stressing the fact that unit cost decreases as volume increases, the speaker warned against any attempt "to collect a monopoly profit which results in a high unit price on a restricted output, because your aggregate profit will be greater if your prices are cut to the limit." He believes that once the economic concepts are clearly understood "the barrier wall between the utilities and the public largely disappears."

Describing the accounting department of a public utility as "the only recording channel of all its activities" and as "the steering wheel which guides the executive in his constructive thinking," J. F. Ford, chairman of the section, said that the Accounting Section must be alert and on its toes continually to meet the constantly changing conditions in the march of progress of the industry.

According to Mr. Ford, the accountant today stands in quite a different light than he has in the past. He "tells you where we have been, where we are now and where we are going. The accountants are the compass for executives to steer their course toward the harbor of successful and financial results."

W. Alton Jones, first vice-president of the Cities Service Company, told the audience that according to old documents, recently discovered in Genoa, it cost Columbus $6,000 to discover America and raised the question as to whether or not it was worth it. He did not suggest that the Accounting Section settle the matter, but pointed out the historical interest to the fact that 500 years ago accountants were employed and careful records kept of business undertakings.

Discussing the investigation of the light and power business now being conducted by the Federal Trade Commission, Mr. Jones said that in his opinion, "there is confronting the accountants of this industry the grave responsibility of seeing to it that in the course of this federal investigation such facts as are required of us be presented in such a manner as not to lead to hasty or improper conclusions on the part of those who will be called upon to consider them and who may be less familiar with our business than they should be."

In conclusion, he said: "I am of the opinion that there is enough factual information available to prove to almost any open-minded American citizen that the government should keep out of all lines of business, but I am equally certain that far too little real factual information about this subject is being presented to the American public."

David Lawrence, president of the *United States Daily*, addressed the session on the subject of "The Trend of the Times."

Commercial Session

THE commercial opportunity now before the electrical industry and the necessity for taking immediate action to increase sales were subjects stressed by one speaker after another during the Commercial Section session of Wednesday afternoon, at which Chairman Marshall E. Sampsell presided. In opening the session Mr. Sampsell stated with emphasis that without the assistance of the investment companies, by the purchase of common stock and by the extension of general credit as well as by management and engineering skill, many operating light and power companies could not keep pace with their rapidly expanding business.

T. O. Kennedy, chairman of the Lighting Bureau, reviewed the several campaigns carried out during the year and declared that millions of customers are not now making use of the lighting facilities afforded them.

V. M. F. Tallman, chairman of the Power Bureau, called for commercial action, but testified to the strenuous competition which electric power and electric heating are experiencing from internal-combustion engines and commercial fuels. He said in these fields it is now sometimes harder to hold old business than to secure new business. He urged careful study of the customer's problem by the man who undertakes a selling job.

Frank D. Pembleton, chairman of the Merchandising Bureau, reviewed the work done by the committees on refrigeration, electric water heating, the electric range and domestic uses of electricity. Mr. Pembleton urged setting up a style or "craze" for electrical appliances, similar to that now manifesting itself for radio or for color in bathrooms and kitchens. With such a fad movement, aided by intensive advertising, Mr. Pembleton predicted that last year's appliance sales of $750,000,000 could be within five years doubled annually.

P. M. Zimmerman, secretary of the National Food Preservation Council, described the September campaign to awaken public understanding to the food spoilage that takes place at temperature above 50 deg. Fahr. and showed how electric refrigeration could be financed out of food wastes in the average family food budget.

Gerard Swope, president of the General Electric Company, declared that the whole theory of central station commercial operation was admirably stated in the convention papers by Messrs. Sampsell and Sloan. The only thing that remains, said he, is for the industry to go to work and "play the game." An average residential consumption of only 456 kw-hr. is an indictment of the central station industry. Mr. Swope emphasized three factors, education of the public, price of merchandise and cooperation with the trade, as the three essentials to future commercial progress.

Martin J. Insull, president Middle West Utilities Company, urged diversification in the sale of power and predicted the increased importance of the commercial staff in the future as it comes to study its economic responsibilities.

C. E. Groesbeck, executive vice-president Electric Bond and Share Company, declared that it is the commercial department which makes the rest of the utility business go. He commented on the 280 per cent growth in the industry's output during the past decade, which has been obtained from 69 per cent increase in the number of customers. The residence load is the backbone of the business, he declared, and is one that can be increased with the least additional investment.

W. W. Freeman, president Society of Electrical Development, described the plans of the Industry Sales Conference and said that a complete program will soon be made public. America offers a huge undeveloped market for wiring, appliances and electrical service, and all experience has shown that sales are proportional to advertising effort expended.

Earl E. Whitehorne, McGraw-Hill publications, presented the prizes in the N. E. L. A. residential kilowatt-hour contest. Checks for $2,000 each were awarded to companies at Cheney, Wash.; Birmingham, Ala., and San Antonio, Tex., for respective increases as follows: 491 kw-hr. to 686 kw-hr.; 433 kw-hr. to 496 kw-hr., and 256 kw-hr. to 415 kw-hr. Second prize checks of $1,000 each went to properties at Fresno, Cal.; Scottsbluff, Neb., and Beaumont, Tex. Honorable mention was awarded to Portland, Ore.; Durham, N. C.; Pueblo, Colo., and Annapolis, Md.

The Federal Electric Company $1,000 award for electrical advertising went to the Edison Electric Illuminating Company of Boston.

Engineering Session

APPROACHING the public utility business as a science, A. C. Marshall, vice-president and general manager of the Detroit Edison Company, speaking before the Engineering Session, said that the successful business man is a scientist whether he knows it or not. As an example, he suggested that there wouldn't be any suspender business if it were not for the law of gravitation.

Taking up the question of total investment per dollar of earnings in the light and power business, Mr. Marshall said that in water power systems this will be higher than where steam-generated power is used. He pointed out that there are developments in the industry tending to increase the investment per dollar of earnings. Among these are: the necessity for replacing poles and overhead wires with underground cables in greater and greater areas; cost of better and more ornamental substations; the increasing necessity for reliability of service; the trend in industry toward replacing man-power with mechanical power; the large capacity of interconnected systems, increasing the duty of all equipment; and the constant striving after higher steam pressures and temperatures.

E. C. Stone, president of the Duquesne Light Company and chairman of the section, emphasized the fact that electric light and power companies in the United States have made such continued progress in fuel efficiency during the last few years that the problems involved in system investment now offer the greatest field of opportunity for further major economies.

Mr. Hoover, on the grounds of specialized education, "is the first real engineer president of our country," in spite of the fact that "George Washington gained an unmistakable renown as an engineer," according to F. R. Phillips, vice-president and general manager of the Philadelphia Company, Pittsburgh, who addressed the session on "Engineers and Engineers."

Summing up, Mr. Phillips said: "The type of engineer for whom there will always be a crying need, must be more than a technician and must be able to more than design and construct; he must be a manager, well versed in economics, finance and public affairs, possessing a sympathetic understanding, a leader, dominated by a desire to promote the public welfare, in order to bring successful results not only out of his own vision, but out of the vision of others so that the dreams and aspirations of mankind may come true. Therefore, the keynote of our present era is the coordination of human effort for the good of all, in which the engineer may play a commanding part."

Speaking on the subject of "Practical and Economic Aspects of Standardization," L. L. Elden of The Edison Electric Illuminating Company of Boston, said that "even the humble cow must provide milk conforming to prescribed standards or she is taboo. In most standardization work," he continued, "it is difficult to distinguish between simplification and standardization, yet in the end it is a combinaton of both, coupled with methods for eliminating waste, that prove to be fundamental factors underlying the success of most undertakings."

He concluded by saying that "standards may be nothing to enthuse over, yet there is a definite measure of satisfaction in viewing past accomplishments in the standardization field. It is apparent on every hand that this work has already contributed to the welfare of the ultimate consumer and the public at large in such liberal measure as to warrant recommendations for continued support and prosecution of standardizing activities on behalf of the electric industry."

Public Relations Session

ADDRESSES by J. F. Owens, chairman of the Section; John F. Gilchrist, vice-president of the Commonwealth Edison Company; Miss Lita Bane, past president American Home Economics Association, and B. C. Forbes, editor of *Forbes Magazine,* were the features of the Public Relations Session held Thursday afternoon, June 6.

Personal obligations of the men and women of the industry formed the topic of an inspiring address by John F. Gilchrist entitled "Superhumans for Better Institutions."

He pointed out that the electrical industry was one that gives one man the producing power of scores of men of only a few generations past, that spreads the noonday light over the hours of darkness, that for a trifle provides the poor of today with relief from grinding labor and with comforts and conveniences, life lengtheners, which the money of the rich could not buy in the days of our grandparents. Speaking more directly, he said:

"Upon you rests the responsibility for the proper development of a great fundamental industry, possibly to become the greatest of all industries and the one to which more than to any other the people of our country and the world will be indebted for the greatest measure of human life and happiness.

"Looking to the future, the greatest need of this industry is for men and women, or, might I say, for superior men and women, superior in mental and physical vigor, superior in common sense, superior in general and special education, trained young people with an intimate knowledge of the present-day conditions in the business in which they expect to embark, so that on embarking there shall be the least time lost in finding themselves."

Mr. Gilchrist then developed ways and means and methods of cooperation whereby men and women within the industry and in educational institutions could be trained to meet the demands of the future. He concluded that much can be done to provide for the future if all concerned will cooperate and make the best use of the knowledge now available. If the student, anxious to prepare himself for a useful and effective life, the educator devoting his education and culture to the turning out of a well developed, well educated and practical human product and the executive in the electrical industry who is in a postion to have the best vision of what is required, will work together on this prob-

The President's Address

By Preston S. Arkwright

President, National Electric Light Association

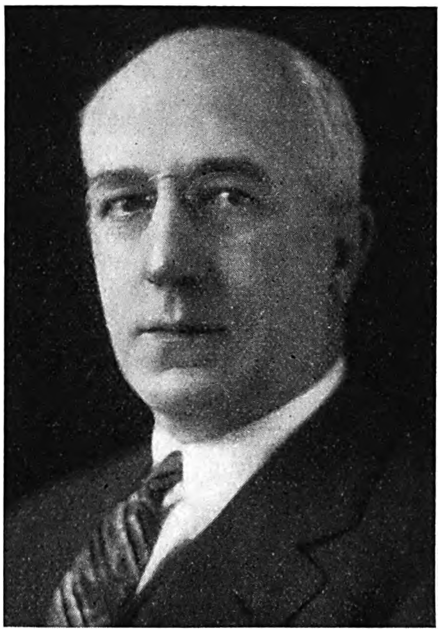
Made June 4, 1929, at the Opening Session of the 52nd Convention of the Association

YOU have honored me to serve you during the year as President of the National Electric Light Association. I have had opportunity to more fully evaluate the work of the Association and to measure the contributions it makes to advancement in electrical progress. In spite of the apparent needlessness of saying it, yet I would like to emphasize that the National Electric Light Association is a voluntary association of separate, independent units. It does not operate, control, manage, construct, finance, or share in the ownership of any electric light or power company. Nor has it any power or authority of direction, control, censorship or veto over the acts, conduct, or utterances of any member of the Association. Its function is to accelerate, stimulate, and coordinate effort in electrical progress. The objective of the Association is "to advance the art and science of the production, distribution and use of electrical energy for public service." This objective is followed with vigor and certainty of purpose. Through the Association, the most advanced ideas, drawn from the practical field of experience of member companies in engineering, accounting, business methods and all the various aspects making up the business, are discovered and diffused.

The company members are not in direct competition with each other in the same field. Therefore, there cannot be and there is not any effort to fix prices of the product or to curtail production. There are no trade secrets between the utilities. On the contrary, the originator of a new idea or improvement finds recognition for his contribution by making it known to his co-workers through the Association.

The Result of Cooperation

The sum total of best abilities, and best minds, within the utilities is made available to member companies, large and small, in all sections of the country. Without the Association, improvements found by one company would be isolated there; through the Association, they find acceptance and prompt application throughout the entire country. Each company thus benefits from the progress of the others and the public generally obtains the benefits of a progressive improved electric service.



PRESTON S. ARKWRIGHT

Of the recent forces in the economic structure of the nation, none has been more fundamental in advancing the living standards than mass production. Mass production of electric power is outstanding among these. We call it interconnection. I refer to the creation of these great interconnected electrical systems concentrating major power production in large efficient power houses, then diffusing and subdividing this power as required for smallest or largest user, in city or hamlet, in the home, the factory, or on the farm. Our engineers, through the medium of the Association, years ago formulated and secured wide acceptance of standard voltages, frequencies, and operating practices thereby laying the essential background which made possible the interconnection of adjacent power systems. The Association rightfully deserves much credit for the rapidity and soundness with which the benefits of this far-reaching advance in power development have been brought to the American people.

There is today available in practically every quarter of the United States abundant and reliable supply of central station electric power at prices competing so successfully with the cost of power from other sources that the public often assumes that the utility companies have a complete monopoly of power supply. The total increase in power capacity in the nation's factories, mines and quarries since 1919, amounting to 9½ million horsepower, has been in electric motors. These industries had opened to them alternative power sources which they could themselves locally install. This growing reliance of the country's manufacture and mining upon electric utilities for their added power supplies is convincing evidence of the remarkable performance of these companies in provision of low-cost, reliable power deliverable at almost any point in any quantity desired.

The accomplishment of the almost revolutionary changes in the engineering, operating and economic characteristics of electric power supply concurrently with need for large expansion in facilities, has thrown an enormous burden of work on our engineers. The best engineering policy and experience within the industry is engaged in interchanging ideas, compiling authoritative information and making this available to every company. Each company benefits from the judgment and experience of engineering talent which in the aggregate but few could singly afford to engage.

Advances in Power Production

The major advances in the art of power production from the beginnings of the electrical industry have come through that industry. Without these inventions and improvements, there could have been no large scale substitution of mechanical for hand labor. Let me briefly summarize these advances: The reciprocating engine was developed to its maximum size and efficiency; the steam turbine, known to Nero in 100 B. C., remained impractical until its combination with the high-speed electric generator and is the major development in steam utilization in the last half century and now the world's principle prime-mover; hydro turbines and the whole conception of hydroelectric development have reached their furthest advance in the utilities. Running through all this path of progress may be found the work of the National Electric Light Association and its members in constant stimulation and diffusion of information on best practice.

The trend is toward larger and more efficient units for power production. Size of turbine and generating units has increased in ten years from 40,000 kilowatts to 108,000 kilowatts. Single power houses are under construction to house 1,000,000 horsepower. These huge power stations—the hearts of the electrical systems—are outstanding marvels of engineering accomplishment. Average quantity of fuel burned per kilowatt-hour in 1919 was 3.2 pounds. Continued improvement in power house design and operation pushed this average consumption per kilowatt-hour to 1.76 pounds for 1928. The aggregate saving due to gains in efficiencies since 1919 amounts to 180 million tons.

Toward More Economical Generation and Transmission

The Association is directing aggressive attention to transmission and distribution, design, construction methods, operating and maintenance practice, and safety rules, in both overhead and underground systems. High voltage cables are under experimental research. Ways are being sought to more economically transmit the increased quantities of power in both overhead wires and underground cables, in spite of conditions increasingly difficult due to congestion. Marking and lighting of power structures within airways, power line crossings over railroads, coordination of the operation of our service with telephone, telegraph, train control, and radio—all involving important relations with other public service—are enlisting your Association's consideration.

Our engineers have focused particular attention toward sound, advance planning of whole electrical systems, anticipating future requirements of the communities served and visualizing the step-by-step placement of power houses and transmission structures to adequately meet the power requirements of each locality at minimum cost. Because of this system planning, electric power facilities, taking the country as a whole, are located and constructed for maximum utilization, most economic operation, and without wasteful duplication.

Research

Your Association, in behalf of its members, at the convention last year, announced its participation along with other industries in the plans of the Pure Science Research Fund for a program in pure science research in the colleges and universities during the next ten years. Provision for our participation was made through increased dues and the Association is now prepared to take its part in this movement as soon as plans are finally formulated by the National Research Council and the National Academy of Sciences.

There has been fuller cooperation between the various branches of the electrical industry in meeting common problems of electric development. There has been decided progress in better understanding between the manufacturer, the contractor-dealer, and all merchandisers of electrical equipment. Our visualization of the contributing factors in electrical development is expanding to properly embrace the whole group of some 700,000 men and women engaged in research, design, manufacture, construction, installation, management, operation, and financing of this great development. The fine work of the National Electrical Manufacturers Association, the Association of Electragists, International, and the Society for Electrical Development and their cooperation with the National Electric Light Association have been contributing factors to this enlarged mutual understanding and direction of common effort toward fuller electrical development.

Accident Prevention

The Association from its beginnings has continuously prepared and diffused information on safe methods of operation, improvements in design for safety, instruction in methods of resuscitation from shock—all designed to safeguard both life and property. As a result of the Association's stimulus, thousands of executives and employees of the companies each year receive instruction. Savings in property loss and from reduction of time loss resulting from accidents are extremely large. A direct measure of the great human value of this useful endeavor is the award in seven years of Insull Medals to 264 persons for saving life.

Standardization

Most of us do not realize the enormous volume of work carried on by the Association in connection with standardization, simplification and codification. It is a decided factor in lowering cost and facility in use of electric service. There is scarcely a piece of equipment apparatus or material used in rendering the service which is not involved; it likewise relates directly to our customers. This work could not be accomplished by any company acting individually; it requires expression of industry viewpoint at over 200 points of contact with national and international standardizing groups. The savings attained to the companies in reduced costs of equipment, reduction of inventories and facility in repairs amounts to millions of dollars annually. Practical uniformity in character of electric supply for voltage and frequency has been attained; attachments for lamps and appliances are the same throughout the nation effecting large reductions in cost of electrical equipment purchased by the consumer, and adding enormously to convenience. Particular attention has been given this year to increased participation in this work and to strengthening industry representation.

Community Development

The electric utility company prospers only as the individual community prospers. Our investments in facilities are an integral part of the thousands of communities we serve. If business is better elsewhere, we cannot pick up and move. Recognizing this, the Association is assisting and urging its member companies to more actively participate in local community and state development. It develops information of value particularly to the small town in furthering industrial development.

Rural Service

Decided progress has been made in extension of electric service to farms, an increase of 30 per cent being credited to this year, which brings the total served to 500,000. It is perhaps the most significant accomplishment of the year. It is only well started. The National Electric Light Association has sponsored and stimulated this endeavor. In 1923 it initiated through the Committee on Relation of Electricity to Agriculture a nation-wide research program participated in by the farmers, agricultural engineers, agricultural colleges, electrical manufacturers, and utility companies, along with other agencies. Research in rural electrification continues in a number of state experimental projects, and a National Rural Research project is under way in Maryland. A vast body of practical information on adaptations of electricity to farm work has been developed and diffused. It aids the farmer in visualization of benefits of electric service to him; it stimulates us to greater effort in overcoming problems of extension of our service to him. The same intensive effort which successfully accomplished electrification of manufacturing industries is now being turned to the most important of all our industries—agriculture. The Association has this year sponsored important regional conferences on rural electrification, and has provided information of assistance to companies in establishing rural service departments.

Railroad Electrification

Increased volume of freight and passenger traffic, arising from growing population and advancing prosperity, has stimulated further attention by railroads to main line and terminal electrification. Electrification programs have been announced this year by the Pennsylvania, the Philadelphia & Reading, and the Lackawanna Railroads. Other railroads have electrification plans under study. It is certain that our railroads will make that use of electricity consonant with sound transportation development. We wish to assist them.

Accounting

The accountants of the industry have a great responsibility. The volume and complexity of accounts have grown to enormous proportions. They have been confronted with the task of handling current accounts as represented by gross earnings, which increased from 281.9 million dollars in 1912 to 1,900 million dollars in 1928. The number of customer records involving monthly billings has grown from 4 million to 23 million. The investment in facilities to be accounted for has grown from 2.1 to 10 billion dollars.

In this field of accounting the Association has been constantly on the alert, keeping pace with ever-changing conditions and problems and in step with industry progress. Every phase of accounting principles and interpretation has been made the subject of thorough research.

The Accounting Section is giving special attention to accounting for interconnection, merchandise accounting, budgeting, and the latest questions in the field of investment trusts.

Continued study has been applied to simplification of procedure in forms and records, particularly in simplification of customer records and bills. Savings attained in reducing cost of handling these accounts represent thousands of dollars. The care and attention given by our accountants to methods of maintaining customers' accounts and billings has been a most important factor in improved customer relations for the only point of contact with many of our customers is through the monthly bill. The Accounting Section of the Association is to be particularly commended for the excellent results attained in this direction and for their fine concept of the customer viewpoint in handling accounts.

With the growing proportions and complexity of the business the accountant will increasingly be called upon to furnish the records of the past and to visualize problems of the future as a base upon which our executives may make forward plans.

Public Relations

From the standpoint of morale, as well as of material things, I believe no twelve-month period ever has been better for the electrical industry than the one just passed. This is equally true of your Association.

During the year the industry, largely through the Association, has borne the brunt of the assault of those who would nationalize the country's industries, businesses and professions. Much of this attack has been directed toward the so-called public relations work of the Association—a work miscalled "propaganda." Despite this, the Public Relations National Section has carried on its constructive work of aiding and directing the industry in its duty of fully informing the public regarding past and present performance and future possibilities and obligations.

Among the many committee activities, all of which have consistently and persistently moved ahead under the able leadership of Vice-President J. F. Owens, Chairman of the Public Relations National Section are two outstanding developments. One is the study made of industrial relations by a committee of that name which includes Health and Medical and Employee Contact practices and instruction, serial reports having been issued and others being in preparation. The other is a study of the Migration of Industry made by the Metropolitan Life Insurance Company at the request of the Association and in cooperation with the Civic Development Committee of this Section.

Widespread as are the activities of this Section they constitute but a minor part of the overall activities of the Association, although a most important part, since future progress of the industry depends in no small degree upon the confidence the public has in the industry and its integrity and honesty of purpose. We feel that we are successfully doing our job—furnishing the best electric service in the world to our customers at fair rates, safeguarding the interests of our investors in our securities, and doing our part in helping to make this the happiest and most prosperous country in the world, and it is a part of that job to keep the public informed.

Commercial

Problems of marketing are confronting our industry no less than other industries producing products for distribution. We recognize an immediate need for concentration on our commercial possibilities. Potentially they are amazing, and the selling departments of our power companies are meeting the challenge with vigorous effort.

Surveys reveal our accomplishments of the past and unfold almost limitless opportunity for commercial expansion. Whether we vision the future all-electric home or the vast sales possibilities in the application of electricity in commerce and industry and in the industrializing of the farm, our conclusion is the same. "Serving the public" unfolds unlimited opportunity for business development.

Our commercial progress is affected by numerous agencies making the marketing of our service unlike that of other commodities. We cannot store our product; we cannot change our prices at will; we cannot transport and deliver always in the most economic methods; we have a limitation of territory in which we can market. In fact, we must build a market by building the community. And yet, we realize as never before how keen our competition is in the selling field.

Important problems of market analysis, the construction of industry-selling programs, the development of salesmen and methods to cope with modern requirements of highly specialized selling, are all being examined and promoted by our National Commercial Section. It is organized to meet the demand upon it for intensified activity and is rendering a highly valued service to the industry.

Geographic Divisions

The Geographic Divisions are recognized as the basic backbone of the whole Association. I have been enormously impressed as I have gone from one Geographic Division to another with the intensiveness, practicalness and thoroughness with which the respective Geographic Divisions and their committees are dealing with and mastering the problems relating to their respective areas, this not only through the Geographic Conventions but in the conferences and committee meetings taking place during the year. Also, I have been impressed by the contributions, coming from the several Geographic Divisions, which, through the agencies of the National organization, are diffused throughout the entire country, to the benefit of the entire industry.

An electric light and power company itself can make no enemies, can gain no friends, can do no wrong. Such friends as it has, those engaged in the industry must gain for it. Such enemies as it gets, those in the industry make for it. It has only such character as the men and women who are operating and managing those companies give to it.

So in going around the country and meeting the men and women from all sections, above all, I have been impressed with the outstanding character, the exceptionally high ideals of business conduct and integrity possessed by the men and women engaged in the electric light and power industry. They are seeking to operate the properties at a profit, of course, because a business service must earn its way if the business service is to continue, but there is a striking absence of greed among them. They are endeavoring to furnish a useful service at a reasonable rate of pay, and if you will notice the rates charged by this industry

(*Continued on page* 346)

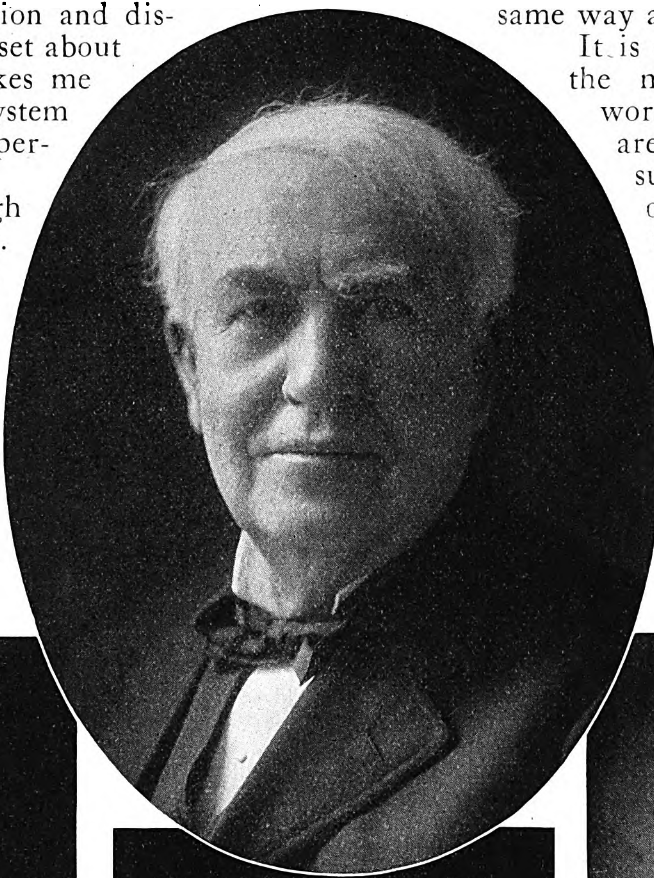
A Man for the Ages

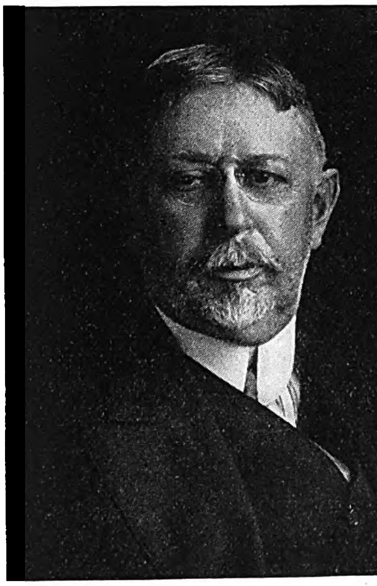
WHEN I invented the incandescent lamp, I realized that the lamp alone was not enough. It was necessary also to perfect a system of electric generation and distribution. I immediately set about to develop it, and it makes me happy to know that the system as well as the lamp still persists in all its essentials.

I had in those days a high opinion of my invention. All inventors have. But I must confess that I never dreamed that from it would come the stupendous electrical industry of today.

Naturally I am gratified to feel that I have been privileged to play a part in this vast achievement. I am proud of the electrical industry—of its vision, courage, zeal and devotion to public service; and I suspect every American feels the same way about it.

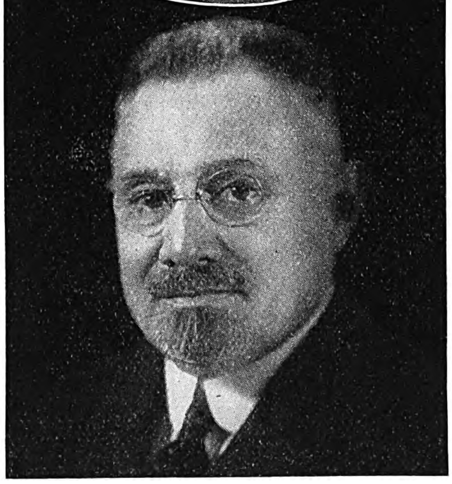
It is a great reward to me and the many colleagues and co-workers, who, I rejoice to say are still living, that we have survived to see the full fruit of our labors. The record is wonderful; but, fine as it is, it can be made still better and I have a feeling that in your hands it will be.—*Mr. Edison's Message to the Fifty-second Convention of the Association, delivered through the medium of the talking-moving picture.*





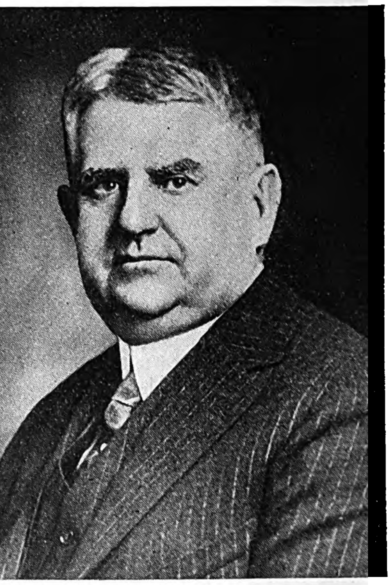
CHARLES L. EDGAR
President, Edison Electric Illuminating Company, of Boston

Though He May Be Acclaimed a Leading Scientist and Inventor, Though He May Be Pointed Out as the Highest Type of American Citizen, Those of Us Who Know Him Best Will Ever Proclaim Him, Above All, a Staunch and Faithful Friend.



JOHN W. LIEB
Honorary Chairman for the Edison Day program at the Convention

Triumph Has Been Realized Over Drudgery, . . . and the Industry Owes Him an Everlasting Debt of Gratitude.



THOMAS N. McCARTER
President, Public Service Corporation, of New Jersey

He Converted Scientific Speculation Into Practical Accomplishment, and Upon the Foundation That He Laid Has Been Reared the Great Structure of the Industry That Today Plays So Great a Part in the Economic and Social Life of This Nation.

Public Policy Committee Report

By W. W. FREEMAN

Vice-Chairman, Public Policy Committee, N.E.L.A.

Presented at the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

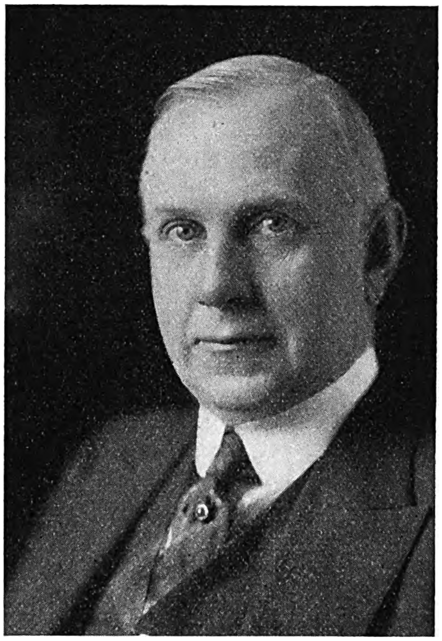
THIS year is "Light's Golden Jubilee." It is fifty years since Edison gave to the world the first practical electric lamp. In this lamp the electric utilities had their beginning; from it has developed the whole field of electricity's usefulness. It is fitting indeed at this time that we express tribute and appreciation to Mr. Edison and that we take some measure of the progress made by these utilities in expanding usefulness and in meeting public obligations in the provision of electric service.

Amid the rapidly expanding and changing character of electrical development, one policy stands out as having been uniformly and consistently followed by all and at all times. This is the policy of growth and expansion. The electrical industry has been progressive; it has not stood still. From the beginning, the men responsible for electrical development have realized the enormous contributions in useful service which electricity has made and will continue to make to the whole national and community well-being, to workers and to homes, to all phases of economic and social life. They understand and assume the obligation to unfold the full possibilities of electric service and translate them into everyday use for all the people, on farm, in village, and in large city. In its plans, its construction of plants and facilities, its organization and financing, the industry has looked to the future. Not only has it quickly adopted advances, but it has stimulated and searched for them.

Year by year, electric service extends; more homes are electrified, domestic use increases and takes on new forms; the service reaches to smaller and smaller towns and on to the farms; electricity is becoming the essential power supply for all purposes; the quantity of power made available for each worker increases. There lie ahead fields of still greater expectation for new and larger uses. The policy of aggressive development and expansion is still essential.

Herbert Hoover made the following statement before the World Power Conference in London, 1924:

"The factor that has been primarily responsible for the tremendous changes of the last century and without which modern civilization could not exist is mechanical power. The form which in increasing degree such power is being applied is electrical energy—the greatest tool that has come into the hands of man. The degree to which we utilize this tool as a substitute for manual labor will largely determine the rate of our social and industrial progress."



W. W. FREEMAN

Electrical development is progressing at a rapid pace. During the past seven years electrical service was furnished to nine million new homes, bringing the total to nineteen millions. No full measure can be taken of the benefit of this in improving family life, effecting economy in expenditure, the saving of time and making for happier living. Electricity has provided a power supply not only for factories but also for the homes. Thousands of electrical appliances are assuming the burden of house work.

Half a Million Farms Served

A distinct characteristic of electric progress in the last few years has been the extension of service to small towns and farms. Transmission lines, constituting a vast net-work even five years ago, have been still further extended to reach four thousand small towns and villages formerly without electric service. So widespread has this service now become that almost every community with more than one thousand inhabitants has electricity and in many parts of the country every community, no matter what its size, receives such service. Not only do they enjoy the benefits of electricity in their homes, but by it the door of industrial opportunity has been opened to the smallest town having also reasonable transportation facilities. The spread of service to the farm continues, until now five hundred thousand farms are connected. The objective of electric service for all the people comes nearer and nearer to attainment.

With the development of great interconnected systems and mass production of power, the factories and workers of the nation are increasingly turning to electricity for power supply. The total increase of 9,800,000 hp. in the nation's industrial enterprises since 1919 has been in electric motors. President Hoover's Committee on Recent Economic Changes in the United States, in its report of May 15, after emphasizing the widespread higher living standards as characteristic of our national life, pointed out that the rise in the use of power has been three and three-quarters times faster than the growth in population, and then added:

"The increasing flexibility with which electricity can be delivered for power has enabled manufacturers and farmers to meet high labor costs by the application of power-driven specialized machines, and power in the flexible form has penetrated into every section of the United States, including many rural areas. The survey shows that as a nation we now use as much electrical energy as all the rest of the world combined.

"Through the subdivision of power the unskilled worker has become a skilled operator, multiplying his effectiveness with specialized automatic machinery and processes. Thus the unit cost of production has been reduced, the drudgery eliminated from much unskilled work and wages maintained or actually increased."

Benefits of Interconnection Available to Public

There has been a clearer crystallization of public understanding of major trends and developments. The far-reaching economic and social benefits of interconnection, mass electric production, and large-scale development have become better understood. The function and usefulness of the holding company in bringing this about has become more generally understood. Mere size of operations causes less comment; the benefits accruing to the public from them are better comprehended. The public generally realizes that through large scale development, electric service is becoming possible to the citizens of the smallest village and to the dwellers upon farms, and that only in this way has there been created the reliable, adequate and low-cost power supply upon which the nation's industrial development is taking place. Experience has demonstrated the savings in expense, the financial stability, the fuller utilization of investment and resources, the increased efficiencies and larger capacity for service which follow unification and consolidation. They are accepted as economic necessities. Failure to apply them would indicate lack of progress.

Through the application of these principles, "as a nation, we now use as much electrical energy as all the rest of the world combined." And it should not be overlooked that all the rest of the world combined hitherto has, to a very large extent, followed the policy of governmentally owned and politically operated electrical supply, while this nation has followed the precept of the immortal Lincoln that "in all that the people can individually do as well for themselves government ought not to interfere."

The benefits of improved efficiencies, better management, large-scale development and advances in the art have been shared with the consumer. An outstanding characteristic of the past year has been rate reduction. The general cost of living continues at 70 per cent above pre-war levels; domestic electricity is 25 per cent under pre-war levels. In 1914, the average household used but 268 units of electricity; in 1928, the average used was 456. Beyond this electricity today will do more than it was possible for it to do then, for scientific advance has provided the consumer with better and additional methods of utilizing it.

Investment in Securities Shows Confidence

Large increases in demand for service; the necessity for large investments in facilities, which is characteristic of the business; the greater cost of furnishing service as it extends to sparsely settled territories, continue to require large sums of money in financing growth. In the year 1928, during this period of intensive governmental investigation, continued public confidence in private operation was demonstrated by the purchase of $1,600,000,000 of security offerings of electric light and power companies.

The year just passed has been particularly noteworthy for the public attention directed to the electric utilities. Their condition, methods, practices and performances have been a major subject of public discussion, which has ranged from vituperative attack and political abuse to sober and constructive consideration of major questions, and has covered most of the degrees between. Utilities today live under the microscope. In the scrutiny that they have undergone real performance in public service has often been overlooked, faults have been magnified and motives distorted. But, on the whole, discussion has redounded to their benefit, and it will do so still more when complete information becomes diffused and the public mind better informed.

The source of inquiry has largely been the Federal Trade Commission. Up to this time, its investigation has been directed largely to the National Electric Light Association, its Geographic Divisions and to publicity activities. The broad work of the association toward accomplishment of its object—"to advance the art and science of the production, distribution and use of electric energy for public service"—has as yet received slight attention. The local state information bureaus have been thoroughly investigated.

Federal Commission Given Free Access to Records

Although the association, as well as its divisions and the state bureaus was early apprised that there was doubt whether the Federal Trade Commission could compel the furnishing of much of the information sought, a decision was reached at the outset to comply completely and promptly with every request of the commission. In accordance with this decision, the commission representatives have been accorded full and free access to all books, records, papers, reports and correspondence of the association. No request has been refused. No question of right or authority has been raised. The result has been a most rigorous inquiry into every activity of the association for the last 20 years. Over one hundred witnesses have been heard, over 7,000 pages of testimony have been transcribed, and 4,300 documents and other exhibits have been introduced into evidence. We have voluntarily undergone a microscopic examination which has delved into records from the dust-covered volumes of the past to the fresh ink of the present, and into thousands of scattered incidents arising from one end of the country to the other.

We understand that this phase of the investigation on the commission side is now practically completed. The commission as yet has announced no conclusions. The industry has not as yet presented evidence in its own behalf. Public impressions have come almost entirely from newspaper reports.

Your committee is confident, as the result of this critical review of the activities of the association for the last half century, and without claiming perfection, that it will be found that its policies have been sound, its work beneficial to the public and the industry, its ideals consistent with the highest American business standards, its mistakes few and trivial considering the number of individuals involved and the large volume of work accomplished.

An independent press is essential to free government. The National Electric Light Association believes in an uncontrolled and undominated press, free to criticize or commend as conditions may warrant.

The utilities recognize that the furnishing of information regarding their purposes, accomplishments, needs and difficulties is one of the obligations of public service. In recent years the association and its member companies have made every effort to inform customers, investors and the public. To that end the association has utilized every opportunity for creating a more complete public understanding. On matters of opinion it has stated its own views; on controversial subjects it has given its own side. Endeavor has been made to correct inaccuracies and misinterpretations. It has done so openly and frankly. Publicity material of the association has always shown the source, so that every one to whom it was sent has known from whence it came. There may have been occasional instances of overzeal in distribution, but we may congratulate ourselves that criticism has been directed to excessiveness of publicity rather than to secretiveness.

At the last annual convention this association by resolution recommended to its members a continuation of the policy of preparing and diffusing as widely as possible full, accurate and timely information on all phases of the business. Truth and accuracy were declared to be the standards by which its statements should be judged. Your committee is glad to be able to report that out of the large volume of publications and informational items circulated by the association, all of which for recent years has been freely submitted to commission scrutiny, none has been found which cannot stand that test. The adverse comment which has been made upon association publicity has not been directed to its truth or accuracy, but rather to its volume and the methods of distribution. The same is true, with few exceptions, of the publicity emanating from the state bureaus.

The widespread distribution of informational material necessarily involves contacts with those who receive it. From

Public Relations National Section Report

By J. F. OWENS

Chairman, Public Relations National Section, N. E. L. A.

Presented at the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

IT HAS been said many times, but will bear repetition, that, unlike most other businesses having an intimate bearing on the public well-being, the electric light and power business has grown up within the remarkably short space of forty years, and in that length of time has assumed staggering proportions and a relatively vital importance in the financial, social, industrial and educational life of the country. It might almost be said that it is the warp of our modern social fabric.

No small part of the progress made has been linked with the activities of the National Electric Light Association, of which the Public Relations National Section is a major division.

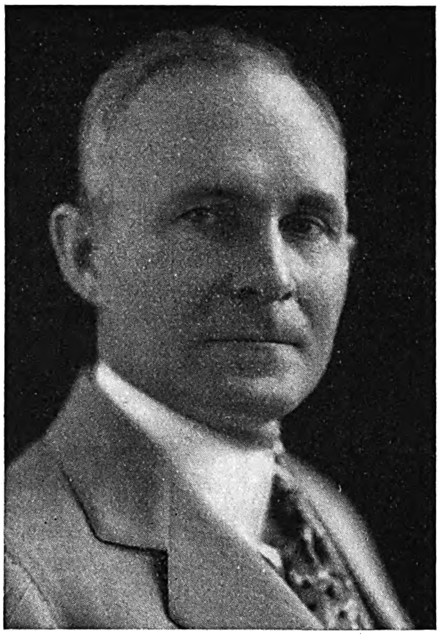
Purposes of the Section

The Public Relations National Section is organized for and devoted to the purpose of encouraging member companies to disseminate information that will give their employees and the public an understanding of the problems involved in the financing of electric light and power companies, and the furnishing, at fair rates, of continuous, dependable electric service. Its major purposes are:

> To encourage member companies in so developing and training members of their organizations that employees will be able to interpret the industry to its customers and the public;
>
> To act as a clearing house through which such ideas and practices as are found helpful in one company or section of the country may be made available to all;
>
> To bring about and maintain a ready acceptance by the public of sound securities issued by the industry;
>
> To be prepared, through study and research, to furnish accurate information on national problems mutually affecting the industry and the public;
>
> To foster and develop cooperative work with legitimate agencies for the dissemination of such information, to the end that friction born of misunderstanding or misrepresentation shall be eliminated and the stability of the electrical industry be maintained.

In the main, the work of the Section throughout the past year has consisted of the carrying forward of plans and policies evolved and partially developed during the preceding year.

As in the past, it has operated mainly through the eight major committees. These committees are:



J. F. OWENS

Cooperation with Educational Institutions
Customer Ownership
Industrial Relations
Information Bureaus
Manufacturers' Advertising
Public Speaking
Relations with Financial Institutions
Women's

Through the investigation still under way by the Federal Trade Commission, the activities of some of these committees have been the subject of discussion and editorial comment in the public press, and for that reason it is felt that in presenting this report a review of their purpose and function deserves special attention.

The Cooperation with Educational Institutions Committee and the Committee on Information Bureaus have been, during the past year, the focal point of attack from certain sections of the press.

Cooperation with Educational Institutions

The Committee on Cooperation with Educational Institutions was established in 1923. Its purpose, as set forth in the Organization Personnel, is "to bring about a closer understanding and better methods of education with reference to public utilities in the higher institutions of learning."

At the beginning it proceeded carefully and somewhat slowly in mapping out its functions and establishing a concrete program. This is justified as a matter of policy in any new undertaking along an unmapped course, and is entirely appropriate, first, in connection with an organization voluntary in its nature, and, second, in connection with any program which ultimately must be determined and approved by educational authorities of the nation.

In respect to the work of this committee in the past, it may be said that there never has been and is not even now a coordinated organization representing both the National Association and its Geographic and State divisions. This is not due, at least primarily, to any lack of appreciation of the importance of the matter itself, but, as pointed out in the National Committee meeting in 1926, it is primarily due to the lack of establishment of a national program and correct guiding principles of cooperation in the public interest on the one hand, and meeting the approbation of educational authorities on the other. At the 1926 meeting of the committee, it appeared very clearly that two things were necessary:

First—The mapping out of a cooperative program, useful in itself, and meeting the approbation of educational authorities.

Second—The establishment of such machinery within our own organization, always recognizing its voluntary nature, as would be best calculated to carry out the program that was finally established.

It was with the thought of ascertaining the extent to which this cooperation has existed, and with mapping out a program through which it might be promoted, that it was finally determined by the Committee which had already made recommendations as to cooperation that the definitive program should be based upon an actual survey of the situation in respect to cooperation in the various parts of the country, and this led to the securing of the services of Dean C. O. Ruggles, then with the Ohio State University, for the purpose of making such a survey. This survey has been carried out, and a report made by the Committee will be forthcoming in the near future.

Recommendations of Educational Committee

During the past year there has not been a meeting of the full Committee. The educational members have been in conference with Dean Ruggles in connection with the survey. The matter of organization within our own ranks seemed to be one which should primarily be given study by our own representatives, and the utility representatives on the Committee met on March 4 and 5 of this year. They made a report and recommendation for consideration by the Executive Committee of the Public Relations National Section. This report and recommendation is as follows:

"This committee has considered the general situation in respect to cooperation by the industry with higher educational institutions. In our opinion it has been clearly demonstrated that this cooperation is not only of mutual benefit but that it serves the public interest and should be continued and further developed.

"There are, however, certain essential facts which we believe worthy of the most serious consideration. During the last year, this industry has been subjected to criticism in relation to some of the cooperative activities, and there exist in some quarters a misinterpretation of our motives and the opinion that there has not always been shown a complete appreciation of the high ethical standards which must at all times prevail in such activities. This committee is convinced that modification of our present organization would reasonably provide in the future against any occasion for adverse criticism of cooperative relationships and further strengthen the field of useful cooperation.

The actual functions of cooperation have been generally exercised by organizations neither directly related to, nor cooperating with, this committee. The committee has lacked such contacts with State or local cooperative agencies as are essential for the formation and promulgation of national policies.

"We recognize the fact that cooperation cannot be exercised efficiently or in the public interest merely through a centralized committee out of touch and inadequately acquainted with local conditions, demands or sentiments. Our organization rests upon a basis of voluntary cooperation as its mainspring. The major responsibility must remain local and any attempt at centralized control would be ineffective. A survey of the entire situation leads us to the following conclusions:

"First: That it is desirable that there should be established in an authoritative way guiding principles to control future cooperative activities, such principles being in general those which should prevail between educational institutions on the one hand and electric light and power companies on the other hand. It is our belief that such principles can be best declared in an authoritative way by educational administrators of national standing and experience. We recommend to our association the furtherance and encouragement of such measures as may be best fitted to secure such declaration of principles.

"Secondly: We recommend more efficient cooperation within our organization to assure sound development of relations with educational institutions, free from legitimate criticism, and such as to sustain with the educators that confidence in our activities and purposes that must at all times prevail if the best interests of the public and all concerned are to be served. We believe that the following plan will lead to this result without trespassing on the full measure of local responsibility in such activities and we recommend that steps be taken to put the plan in effect in the immediate future.

"We recommend that each geographic representative of this committee take up with leading executives in each State within his division the initiation of such steps by the utility executives in connection with administrative heads of educational institutions as will bring about in each State the selection of an industry representative satisfactory to the educational institutions to whom in each State there shall be referred for approval all proposed cooperative activities.

"We further recommend that such representatives be requested to act as the State representatives on the geographic division committee of this committee."

These recommendations have been indorsed by the Public Relations National Section Executive Committee and by the Executive Committee of the National Electric Light Association.

The Industry Deserves the Attention of Educators

Certainly our industry, occupying such an important place in the scheme of things, deserves the careful attention of educators. So rapidly has it grown and so rapidly is it developing that it is almost beyond the power of those in intimate contact with its development, those who are wont to call themselves a part of this development, those whose brains and minds and hearts are given to it, to keep abreast of its progress in all of its phases.

If this business of ours is destined to play in the future even a more important part than it has in the past in the social, economic and industrial life of the nation, it is important enough to have brought to bear upon its development the best thought of the best trained minds in the nation. It is important enough that the youth of the land, who are being poured out annually from the colleges and universities of the country into this whirlpool of the present social order, are allowed to drink from the running stream of current facts, rather than from the stagnant pool of worn-out ideas, pools poisoned as they frequently are by the sophistries of discredited theorists. That the youth of the land, going forth from our great universities to be the molders of public opinion in the future, should have the benefit of facts relative to the evolution and operation of our business goes without saying.

If the students of the universities and colleges are to drink from the pure stream of current facts, they must have free access to the only reliable source of information—the great operating utilities of the electric light and power industry.

It is through these companies that the product of the mind of thousands of men and women, who have been and are engaged in research and study into nature's laws, and the product of manufacturers, who have taken these laws and fabricated out of them instruments through which the laws might be applied for the comforts and conveniences of mankind, have found practical application to the everyday needs of modern life of the mechanical genius of the one and the discoveries of the other.

What better than the operating companies can be found to serve as a basis for authoritative information on the application of electricity to modern day needs? Where is the educator to go, if not to the electric light and power companies, for the information that he needs in fitting the young minds in his charge to cope with the problems which the introduction of this new force is bringing to the social order?

It was with the full realization of the duty that the electric light and power industry owes to those whom it serves—that they should be able to secure from authoritative sources accurate information on our business—that the Cooperation with Educational Institutions Committee was established. For, let it be said here that our obligation to the public does not end with the furnishing of an ample supply of electric energy at the entrance switch to the house or factory. We owe the public the duty of seeing to it that the information given to the youth of our land is accurate, current and in keeping with the facts.

Be it said in passing that most of the cooperation that had hitherto existed between educational institutions, on the one hand, and electric light and power companies, on the other, had its inception in the eagerness of educators to gather from electric light and power companies the facts needed for the proper presentation of the industry's place in the modern scheme of things.

Be it said further that in too many instances electric light and power companies are yet unmindful of their obligation, not only to those of our own time, but to those who shall follow, and are indifferent to the justice of the request of the educator and to the importance to the industry and to the public of complying with his request. I believe it to be the duty of those engaged in the electric light and power industry, when they realize that institutions of higher learning are not being adequately supplied with facts relative to our business, to take the initiative in seeing that such contacts are made as will warrant educators in believing that they can secure accurate information about the financing and operation of electric light and power companies.

Public Utility Information Bureaus

Mention was made earlier in this report of the activities of the various information bureau organizations.

Information bureaus were established in most of the States of the Union, in keeping with the feeling on the part of many leaders of the industry that the public should be kept fully informed by operating companies, using for that purpose the recognized channels of information, and to set up for companies unable to maintain such equipment for themselves, a vehicle through which this information could readily be conveyed.

In the main these bureaus have served a very useful purpose, and through their operation has been set up a source of information which the recognized media for the dissemination of facts have found to be authoritative and helpful. Newspapers have in the past come to lean on these bureaus for news that to them appeared timely, relative to the progress and growth of the companies in their State. Speakers and writers have found the information furnished by these bureaus timely and accurate.

Since the establishment of the information bureaus, however, mergers and consolidations have eliminated many of the smaller companies, making it possible for the units so formed to maintain, as a part of their personnel, experts in the matter of assembling and distributing information relative to the operation or financing of the companies. For this reason there has grown up in the minds of some a feeling that the usefulness of the information bureaus has passed, and that their functions can well, and perhaps better, be taken over by the operating companies themselves, who, after all, are charged with the responsibility of seeing to it that full and accurate information is obtainable by and given to their customers.

The question of the continuance of these information bureaus is food for thought, but it is felt that the solution lies with the individual companies within the States maintaining bureaus.

Confidence in the Industry

Any business, if built on a lasting foundation, must have the confidence of those whom it essays to serve. To gain this confidence and hold it, the organization must deserve it. A business can deserve it only by adopting as a policy in the transaction of its business the old-fashioned virtues of honesty, fair dealing, straight-forwardness, and a willingness at all times to give fully and freely information of any kind and character pertaining to its business.

Particularly in the utility business is confidence the basis of any sound and lasting prosperity.

As one studies the progress of the human race and the development of society, he is convinced that no movement that has made for social progress has long lasted unless it had as its motivating force a conscious purpose to make of the movement something beneficial to those whom it would serve.

Business is but one branch of our social order. But lasting business, like any other function of society, must have as its objective a beneficial influence on the race.

Measured by this test, our business has within it an inherent contribution to the advancement of the social order.

Through the use of electrical energy, men and women are relieved of back-breaking drudgery and hours of endless toil. Their God-given minds are free to reach out toward higher development. We are no longer content to do with manpower the hard work that can be accomplished with electricity and steam.

Each month, in fact, almost every day, new applications are being found for electrical energy. New machines are being perfected to relieve man of still another form of labor. The American farmer, through the application of the products of American inventive genius, soon will find the drudgery which constituted the greatest obstacle to the retention of keen business minds on the farm a thing of the past. Already the isolation characteristic of the farm a few years ago is but a memory. Electricity has done all this, and we have been a part of it.

It is interesting to contrast the present-day mode of life with what obtained ages ago, when human lives were held cheaper than the products of the quarry, and thousands of men were worn out in the erection of the great structures that stand as perpetual protests and reminders of the sacrifices of human energy that went into their making. Contrast our present age with the days when men were chained as slaves to the galleys, pushing vessels of war and commerce across the seas; and, even in later years, the days when not only men but women and children toiled out their lives in the mines, factories and workshops of industry. American genius, American enterprise, fostered by American individualism, aided by American business, is fast bringing us to the time when, in America, electrically driven machinery will do our every task.

Through the efforts of the men of this industry, in cooperation with manufacturers and scientists, electric power plants are taking from the earth its stored energy in the form of coal, oil and natural gas, and converting it into the most mobile form of energy—electricity—and transmitting it to the home and the factory and with it performing the labor of 350,000,000 men.

Think of it, every man, woman and child, on an average, in America, has at his beck and call three willing, tireless servants, never complaining, ever ready to do his bidding. Is it any wonder that America is prosperous? You men and women of the electrical world have seen your genius, your industry, your enterprise, remake a world. I say, therefore, and I say it with pride, that our industry has within itself inherently those qualities which, if honestly applied to the service of mankind, should and will insure its stability and its lasting prosperity.

Our task is made the more difficult because we are, by the very nature of our industry, a monopoly. The lengths to which men have gone to free themselves of monopolistic power have demonstrated the fact that men do not readily give up the right to pick and choose of their own free will those upon whom they would bestow their patronage. We, therefore, have a handicap in obtaining and retaining public good will not encountered by those engaged in competitive businesses.

What Our Future Depends Upon

The industry has been successful in applying the laws of nature and the products of inventive genius to our problems. We have won the confidence of the leaders of the financial world. This is much, but it is not enough. Our future depends upon the degree to which we can obtain and retain the confidence of those who, in the last analysis, are the makers or unmakers of business and government, "the folks back home."

Years ago, the immortal Pope said, "The proper study of mankind is man." What a world of philosophy, what a treatise on all human relationship is bound up in this short terse sentence.

After all, it is not enough that we conduct our business with honesty of purpose, with an unselfish desire first of all to give to our customers the full measure of service, beaten down and running over, but that our customers must know and feel within their inner-being that we are honest. In short, they must believe in us. This is my reason for saying that, in the end, public relations begin and end within our own organization.

Our business has grown up through an era of great mechanical development. The best minds of the world have been directed toward drawing from the mines of the hidden recesses of nature her jealously guarded secrets. They have patiently, by day and by night, woven these secrets into recognizable laws. Other men, through employment of their inventive genius, have made it possible, through the development of mechanical processes, to apply these laws. We have taken up the gage at this point and are carrying it forward for the benefit of the home, the farm and the factory.

We have been very careful in the selection of the mechanical equipment that enters into our business. We have employed every known test to determine its fitness for the job. But have we been as careful in the selection of the human element, chosen to interpret our business, and the organization we have set up, to the public? In the end the public will think of us as they think of the men and women whom we have associated with us as the interpreters of our business to those intimate circles with whom these men and women come in contact. The question, therefore, of so-called industrial relations is at the very heart of our public relations.

Industrial Relations

The Industrial Relations Committee of the Public Relations National Section has been formed for the purpose of giving to this all-important phase of our business the intensive study which we have hitherto given to the mechanical aspects of the business. No man or woman should be selected for a position in an electric light and power organization until, at least, every known test by which his fitness for the job, and the determination of whether or not he possesses the qualifications to assume greater responsibility, has been applied. This is not enough. He must be so informed about the business in which he is engaged that he can properly and adequately interpret this business to his neighbors and friends, and I am of the belief that, to the extent that he goes beyond the sphere of his ordinary activity to extend opportunities for this interpretation, to that extent does he merit recognition and advancement. Nor yet is this sufficient. In the mechanical field we are wont to test from time to time the condition of the equipment employed, properly to discharge its functions. What about the human element of our business? Are we concerned about the conditions under which the men and women employed in our industry work, and do we go beyond the hours of employment and learn of the stresses and strains that may sap their mental energies and may impair their fitness for the job? In too many instances I fear not.

When we have given at least as much attention, care, thought and study to the human element of our business as we have given and are giving to our mechanical equipment, then, and not until then, shall we have the right to expect our employes enthusiastically to help us build our organizations into, and a part of, public confidence and good will.

In the past year the Industrial Relations Committee has issued two serial reports. These reports are the result of special surveys made to determine what methods and means have been employed in the selection and training of electric light and power company employes, and what measures have been adopted and followed by progressive companies in safeguarding and promoting the health and happiness of employes. I commend these reports to your earnest consideration, feeling, as I do, that they are a real contribution to our business.

Other Committees

The Customer Ownership Committee brings to the industry a very definite recommendation. On the theory that our responsibility to our stockholders does not end with the acceptance by them of our securities; on the theory that the good name of the industry is something of which we should be most jealous, the Customer Ownership Committee feels that there should be some sort of impartial tribunal to which men and women, who have purchased our stock and are offered in exchange therefor other securities known to us to be of doubtful value, may appeal, with a consciousness that they shall secure an unprejudiced verdict. Therefore, the Customer Ownership Committee recommends cooperation on the part of electric light and power companies with the Better Business Bureaus of the Nation. These bureaus are doing a great work. They have the facilities for impartial investigation. They should be supported. The recommendations of the Customer Ownership Committee have been approved by the Executive Committee of this section, by the National Executive Committee and by the Public Policy Committee.

The Public Speaking Committee has had a remarkable year of achievement. More talks by employes about our business, in an unselfish effort to interpret it to the public, have been made this year than ever before. But the important phase of this public speaking program is not the number of talks that have been made, but that "something" which, once an employe has been able to give expression to the thoughts that are in him, wells up and makes of him a different man or woman. As a method of employe training, I commend to the electric light and power companies of the country public speaking.

Our relations with financial institutions were never better. We enjoy the confidence of the investing public.

I cannot close this report without paying a tribute to the marvelous spirit that has been developed among the women of our industry through the activities of the Women's Committee. Cooperating, as it has, in that most estimable of all recent departures, the home service movement; pointing the way, as its leaders have done, to the women of the industry to enlarge their opportunities for service, and to broaden their sphere of activity; encouraging, as this Committee has, our women to know their organization, to know its policies and its hopes, and, knowing, to interpret these policies to the women of the nation—this Committee has made a lasting contribution to the industry.

We owe to Miss Malicki and her devoted staff a debt which is beyond our power to liquidate.

It has been my good fortune during the past year and a half to come in contact with many of the leaders of our industry. I say to you in all frankness and sincerity that I do not believe there will be found in any other line of business, on the whole, men and women more genuinely interested in the well-being and welfare of those whom they serve. I have found, by and large, that these men and women are recognized in the communities in which they live as leaders of thought and leaders of action. They are known to be good citizens. They are a part of, if not leaders, in every movement in their communities, making for progress and community betterment.

Friends, these men and women, and not a few scattered individuals who may have so far forgotten themselves as to exploit the public for their own individual selfish ends, constitute the electrical industry in these United States. These energetic honest citizens, engaged in our great business, might hurl into the teeth of their critics this query: "What, sir, have you contributed of your energy to the well-being of labor and industry? How have the fireside, the farm, the mine and the factory and those toiling therein been benefited by your life? We, of the electric light and power industry, have hazarded our all in bringing to our citizenship opportunities for greater leisure, greater comforts, greater happiness. What have you done, except to carp and criticize and to hinder? Are we, the honest men of the industry, to be pilloried because a few have gone the way of many other

Commercial National Section Report

By MARSHALL E. SAMPSELL

Chairman Commercial National Section, N. E. L. A.

Presented at the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

IF we have made commercial progress this administrative year, a great degree of credit belongs to Mr. C. E. Greenwood, Commercial Director, N. E. L. A., the Vice-Chairman, Committee Chairmen and Committee Members. We have received inspiring assistance from the officers and members of related committees throughout every Geographic Division; helpful counsel from Paul S. Clapp and N. E. L. A. Headquarters; splendid cooperation from the other National Sections and Committees, and profited in large measure from our contacts with the Society for Electrical Development. It has been a pleasure and revelation to me to be associated with the sound thinking, well-informed men and women who are so successfully carrying forward commercial work.

The Commercial National Section has approached its work this year with full appreciation that the electrical industry is a predominant factor in constructive upbuilding of American production. We realize that the unique relationship of our industry with all commercial and industrial activities daily carried on throughout this country has afforded unequalled opportunity to reduce production costs by invention, science and standardization, thereby helping to establish and maintain exceptional wage and living conditions.

We Cannot Rest on Past Performance

Our light and power companies can be justly proud of their contributions to the practical needs, comfort and welfare of the public generally and the millions of customers they serve. They cannot, however, rest complacently on past performance. To remain an agency for constructive achievement they must take full advantage of present abundant opportunities and be ever alert to future possibilities.

We have kept in mind the billions of dollars our light and power companies have expended for facilities to conduct their business. We know, too, these dollars were not secured, except in small part, from earnings; but from the sale of bonds to financial institutions; preferred stocks to individual investors, including a veritable army of company customers; and common stocks, in most part, to investment companies, without whose assistance through such purchase and extension of general credit, management and engineering skill, our operating companies could not have properly kept pace with their rapidly expanding business.

MARSHALL E. SAMPSELL

We realize we are no longer living in the years during and following the war, when we were seriously put to it to provide facilities to serve our fast-increasing loads. Our problem during those trying years was: How can we finance additions to our properties to carry the loads brought to us without solicitation? Our problem now is: How can we most intelligently bring about greater diversification in the distribution of our product—electricity—to more surely safeguard the heavy investments already made, and yet to be made, for generating capacity and distributing facilities?

To protect investments made in transmission lines interconnecting smaller communities and extending into rural districts, where there exists little industrial activity, requires larger volume of electric service in small-town homes and on the farm. To successfully meet these obligations we must sell more kilowatt-hours through intensive development of new markets that will improve load factor. To bring about and proportionately enjoy intensive development of these new markets is no boy's play. In this undertaking we are forced to meet keen, well-organized competition from other industries, equally anxious to grow and prosper.

To intelligently educate our present customers and others to greater and more diversified use of our service; provide them with suitable energy-consuming devices to enable them to so use the service; and obtain more helpful information for the industry, the Commercial Section was reorganized last August into four bureaus, namely: Lighting, Merchandising, Commercial and Industrial Power and Heating, and General. Each bureau, except the General Bureau, embraces certain committees of related activities and is under a Vice-Chairman. The General Bureau committees report to the Section's Chairman. This arrangement has coordinated our own committees; harmonized more completely with Geographic Division related committees; permitted separate bureau meetings, and made unnecessary frequent group meetings of the Commercial Section. Excellent cooperation from Geographic Divisions has resulted in increased attention to commercial development throughout the country.

Teamwork Essential

The slogan of the Commercial National Section last year was: "More Kilowatt-Hours per Capita." Our slogan this year is: "More Kilowatt-Hours Through Group Teamwork."

If our industry is to secure a larger share of the consumer dollar, the executives of our operating companies must bring about closer departmental teamwork within each company, so that our engineers, accountants and other principal operating officials may look beyond the specific work they perform into the commercial field where cooperative effort is now required. This cooperative effort will lessen sales resistance and assure new service income that will result in financial advantage to the company and rate advantage to the customer, whose consumption of more kilowatt-hours, better diversified, provides the basic source of net earnings for the company.

Group teamwork is equally essential

between our National Association and the respective Geographic Divisions and State Associations. Our National Sections were undoubtedly created to better perform work most closely related to subjects assigned them, and it is only by group teamwork between these separate National Sections and corresponding sections or committees of Geographic Divisions that we can expect to properly handle the mass of work involved at least expenditure of money, time and human effort.

It would, therefore, seem the slogan, "More Kilowatt-Hours Through Group Teamwork," accurately describes the goal we have in mind for our Association, whose avowed purpose is: "To Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Public Service."

The need for group teamwork between our four major national associations and the electrical leagues was the impelling reason for reorganization of the Society for Electrical Development in 1927, resulting in more sympathetic understanding of the commercial problems that so vitally affect the electrical industry.

We have kept before us our common need for greater consumption per unit of industrial power and domestic service and the existing possibilities for scientific development and diversification of commercial and industrial power and lighting. Consequently we have been studying the principal handicaps to our commercial progress and planning how to deal with them.

One of the most serious handicaps to commercial progress is adequacy and price of wiring, due largely to code restrictions. The principal reason wiring in general is not adequate is that ADEQUACY has not been sold. Present costs of wiring are perhaps not too high under the conditions of present wiring jobs. Our Wiring Sales Committee has been working with the Codes and Standards Committee and Engineering Section on the National Electrical Code and the whole wiring situation. We have had several joint meetings with representatives of the National Electric Manufacturers Association respecting certain drastic changes in grounding rules. These meetings have been of value to the entire electrical industry and afford concrete example of the advantages of group teamwork.

Rate Structures

Another serious handicap to our commercial progress is that our rate structures are not sufficiently conducive to broad promotion of electricity. It is not contended these rates are too high, but that their form is not calculated to encourage the most liberal use of energy, which must result in a lower average rate to the consumer. The price of energy is one problem over which our electric light and power companies have most control and, if we can solve that problem, we can better compose commercial problems in which others have a mutual and beneficial interest. The Promotional Rates Committee of our Section has been studying rate forms for domestic service and the relation of existing rates to development of household appliance loads.

Another handicap to our commercial progress is price of energy utilization equipment and quality standards in types of appliances. Prices may not be too high for the present demand, but are they not too high to permit universal acceptance and use of them by the average housewife who perhaps needs them most? Our Section is carefully examining quality standards, as affecting costs, performance and market acceptance of both low and high-priced models.

Our intensive study of handicaps to commercial progress has not caused us to lose sight of other avenues for load building.

We appreciate our business is each year becoming more highly specialized. To stimulate intensive training of commercial men working in specialized fields, training schools have been held during the year covering Electrical Advertising, Home Lighting, Industrial Heating and Commercial Cooking. The success of these undertakings merits repeating them.

Our Section has made conspicuous progress in impressing the advantages of proper illumination, instead of lighting for vision only. Through group teamwork with architects and lighting departments of our companies, we are bringing about more adequate wiring for higher standards of illumination. The method of marketing electricity for electrical advertising and lighting of streets and highways is being pushed. both for its commercial value and civic betterment.

Our power committees are studying commerce and industry to more intensely promote electricity for every power and heating need. Highly creditable reports covering specialized fields have been developed to equip our salesmen to show the advantages of electric power over supposedly more efficient means offered by our competitors.

Another phase of our Section's work has consisted of searching for facts concerning particular classifications of our business.

A Water Heating Survey of national importance is under way, the field work being done by the Engineering Section at Headquarters. This survey will doubtless clearly indicate the water-heating service is of value to the customer and affords wide opportunity for desirable revenue.

Another fact-finding undertaking of consequence to rural customers and our business is the work of the Farm Appliance Sales Committee. Its personnel includes representatives from the Rural Electric Service and our Merchandise Sales committees.

An activity deserving particular support is the plan of our Refrigeration Committee to nationally point out the relationship of food preservation to health. This plan is non-commercial, includes all groups interested in food preservation, and will be carried to completion by the National Food Preservation Council, of which Matthew S. Sloan is President.

Under the auspices of the Society for Electrical Development, the Commercial Section is taking part in a thoroughgoing search for facts as to adequacy of wiring in typical American homes; number and nature of electrical appliances used in the average household; consumer interest and appreciation of the value of electricity; and ways and means to develop a larger market for electricity in the homes of this country. This survey was made by a leading advertising agency under specific instructions of the Sales Plan Committee of the Electrical Industry Sales Conference. At this afternoon's session of the Commercial National Section W. W. Freeman, President of the Society for Electrical Development, will discuss the present status of this plan, its value as an agency for intensive development of our markets, its advantages as a messenger of good-will and far-reaching benefits to all elements in the electrical industry.

Our Association's monthly BULLETIN has carried the Service Suggestions of the Customer Relations Committee. The informative and useful data furnished through this committee has doubtless been followed with interest by all commercial executives and field men.

Our Section is cooperating with the Accounting Section, through a joint committee, in further effort to adjust the accounting problems our enlarged commercial activities have occasioned.

Trade Relations

The Commercial Section has been closely studying merchandising methods of others engaged in selling household electrical equipment. Despite our close contact with our domestic customers, we can never satisfactorily develop a maximum volume of appliance sales until we have the complete and cordial support of all other classes of merchandisers of electrical appliances. It is not to our interest, nor have we the slightest desire, to monopolize the appliance business. It is our desire to so plan our sales programs as to encourage and assist the manufacturers and dealers who are helping us promote acceptable labor-saving and convenience services. It is respectfully recommended that the Declaration of General Merchandising Principles agreed to by all concerned and the electrical merchandising standards suggested by the General Merchandising Committee of our Association be followed, as guide posts to better trade relations.

Just a few years ago the local craftsmen carried on the manufacturing of the country, and business consisted of small isolated transactions. There was no such thing as massed production, massed capital or corporate machinery. Events of importance were known many moons after their occurrence. Light came to us from the tallow candle, kerosene lamp, and open fireplace. The kilowatt-hour, the untiring helpmate of humanity, was a stranger in the home, workshop and on the farm.

Today we are fully advised of the world's activities when and as they take place. The radio, telephone and telegraph and transportation on rail, rubber and in the air make time and place factors of small consequence. The availability of electricity for countless light, heat and power purposes has raised man's stooping shoulders from endless labor and relieved the weary housewife of hours of toil.

To one man, above all others, is due this marvelous transition from primitive days into an era of ever-increasing growth and expansion of industry, business, transportation and communication. This man has made it possible for us to translate the dreams of our electrical industry into time and labor-saving realities.

The commercial members of the light and power companies throughout our land are impatiently anxious to participate with all the world in honoring that man, Thomas A. Edison, and through Light's Golden Jubilee, to felicitate him on the occasion of the fiftieth anniversary of his invention of the first practical incandescent lamp and the system of electrical distribution that has made possible our own great industry whose good name we so zealously guard.

Voices Across the Sea

Speakers in Moving-Talking Pictures filmed especially for the Fifty-second Convention of the Association

Dr. Alberto Pirelli
Milan, Italy

"AS President of the International Chamber of Commerce, I am happy to voice the admiration of business men of forty-six nations, for the work of the inventor and for the development of scientific research. And in no place is this work more manifest than in the United States.

"No one knowing anything about the electric light and power industry can picture it as being, or becoming static in any country, and least of all in the United States. Public appreciation of electricity arrived long before its economic victories. It was accepted that it would do the things that people expected of it, and it always exceeded expectations.

"It has brought untold benefits to industry and commerce, and has provided comforts and leisure for the home, so that great multitudes enjoy a freedom and a dignity beyond that which earlier civilizations allowed. And for much of this the world is indebted to the inventive genius of Edison.

"Years ago Beethoven was conducting a performance of his Ninth Symphony. So moved and entranced with the beauty and majesty of the music did the audience become, that they stood and applauded the composer enthusiastically. But Beethoven heard not, heeded not; for his ears were deaf to their cheers. For years Edison also has lived in that silence which Ibsen calls 'the home of the strong' and my hope and heart's desire is, that if he cannot hear, he may at least sense how great is the gratitude of a world which this day salutes and cheers him as one of its worthiest inhabitants."

Sir Ernest Benn
London, England

"THE civilization of each generation through the whole of history has rested upon the private property made, owned and cared for, by the previous generation. There is no exception to this universal and age long experience.

"On the other hand each generation has been handicapped with the debts of its forefathers, represented only by the blunders of public ownership.

"The private individual tends always to acquire wealth—real wealth—which remains in the community for its comfort. No community has ever acquired anything worth mentioning but debts—the opposite of wealth.

"The property in the hands of public authorities of the world today is not worth more than 5 per cent of the amount of the debts of the same authorities.

The economically perfect society wants the maximum of wealth—houses, railways, electricity plants, steamships, machines, and numbers of other things. All experience shows that the private individual, through private ownership, is the only agent that can be trusted with these things. He makes them, he cares for them, and he passes them on, free of debt, to the next generation.

"Can there, then, be a shred of doubt in the mind of any reasonable man that the public good, the well being of society. the advancement of civilization, the raising of the standard of life of the people, and all the highest and the best of economic aims can only be secured by a firm adherence to the principle of private ownership.

Sir Kengo Mori
Tokyo, Japan

"AN invention whose advantages can be enjoyed by only one section of the community, or the people of one country, cannot be termed a true blessing. But the electric lamp is a true blessing in the sense that its beneficence extends to every man, every woman, the world over.

My country was lighted at the rate of one lamp for every two people in 1927. No later figures are available, which fact throws into a relief as clear as the illumination I am talking about, the rapidity of the expansion this public utility is making. Official statistics cannot keep pace with its progress.

"The electric lamp has a sister, equally admired, more vocal; but less enlightened. I refer to the telephone. This lady, however, is less fortunate and is often seduced in Government hands. Her virtue is not therefore always irreproachable.

"There are three virtues which are rarely possessed combined by mortals,—beauty, cool head and a warm heart. The only thing I know which possesses them is a mountain in Japan. Its name, which must surely be known almost as universally, is Fujiyama. It is beautiful in form. Its head is cool in perpetual snows; and its heart is warm with internal fires. But it has its peer in the electric lamp, which is a happy mixture of these three virtues.

"Let us hope that this wonderful creation may make still further progress in the days that are to come, and in its gathering strength bring light upon the questions which trouble mankind; and in the solution of which the West and the East must join hands."

The Exhibition

IN conjunction with the N. E. L. A. Convention, which was the first to tenant the new Atlantic City Municipal Auditorium, just completed at a cost of $15,000,000, there was staged the largest exhibition of electrical equipment that has ever been under one roof. The mammoth hall of the Auditorium was crowded with the displays of over 200 manufacturers of electrical equipment requiring more than 97,000 square feet of floor space. Many of the exhibitors vied with each other in their lighting effects and the many models of their products. There was every conceivable sort of apparatus for generating and distributing electricity as well as for its consumption in the home, factory, in transportation and on the farm.

There is perhaps no other place, it was remarked at the show, where it is possible for one observer at one time to view such a cross-section of electrical equipment. The engineer and the commercial man, by one trip around the immense room were able to see the products of practically all the manufacturers that produce for their fields. The obvious advantages of this to the entire industry has made the N. E. L. A. exhibition the outstanding affair of its kind in American industry.

Measured merely in terms of magnitude, this year's exhibit marked a rapid forward stride. There were almost 25 per cent more exhibits than in 1928. This year's total is 226, against 210 last year, and 194 the year before. The rise from 41 exhibits in 1908 represents real progress, and more than a dozen of the original exhibitors had displays this year.

For two days preceding the opening of the convention the public was admitted to view the exhibits. This provided an educational opportunity of no small importance to the public service companies, as well as the exhibitors, to show the public a wide range of heavy apparatus and appliances which constitute the backbone of the country's generating and distribution systems. Improvements to increase reliability and operating convenience were outstanding among the apparatus displays.

Interesting features of the heavier equipment included: Devices for maintaining energized circuits for automatic regulated frequency; a newly designed portable power unit; a new motor operated, armor-clad switchgear unit and a transformer tap changer for operation under load. There were also a new delayed operation time switch, variable up to three minutes, for use in automatic substations, etc., and a new adjustable interval time switch from one to twenty minutes. One company displayed a complete manhole installation for high-tension service and another company a breaker in which are eliminated the use of A. C. motor mechanisms. The same company had a device which applies entirely new principles to the quenching of the arc in a circuit breaker.

One of the manufacturers devoted space to several new equipment items, including a series capacitor, a motor-operated outdoor disconnecting switch, an oil-filled coupling capacitor, undervoltage device and a non-metallic explosion chamber for oil breakers from 132 to 220 Kv.

Among the newer and partially experimental exhibits were an automatic airport relay, several interesting applications of the photo-electric cell and the transmission of photographs and messages through space by a beam of light.

It is highly significant from the standpoint of the success of the exhibit that the exhibitors at this time were able to display heavy equipment to a much greater extent than formerly, due to the avoidance of the limitation formerly placed upon them in the quarters occupied by previous conventions. No such limitation exists in the new building, and the exhibitors have taken advantage of this situation in a large way.

In the appliance field, the coloring and artistic design of many of the appliances add greatly to the sales appeal. This was not merely an attempt to cater to the esthetic interests of the housewife and to blend with the modern colored kitchen, but undoubtedly carries the inference of superior workmanship and durability as well, when so much attention is paid to external appearance.

Two companies showed for the first time small washers and dryers in one compact unit. An appliance company had vacuum cleaner unit as a substitute for separate attachments. One range manufacturer is showing a new combination coal-electric range and another a wall outlet range with standard size oven. External appearance was emphasized more than ever in the coloring and design not only of small household appliances such as ironing and washing machines, percolators, toasters and beauty specialties, but also in the larger products, such as refrigerators. The larger volume of this domestic equipment shown is indicative of the steady growth in current consumption. A refrigerator, incidentally, was brought to the convention by airplane.

The tendency toward more intensive commercial activities on the part of the central stations of the country, voiced repeatedly from the platforms at the meetings, was reflected in the wide variety of household appliances. The beauty of the entire exhibit was noticeably enhanced by the displays of many companies that featured modern lighting. Signs were blinking, lights were flashing and music from radios and the large orchestra played the accompaniment.

President's Address

(*Continued from page* 335)

for its service, you will see that they almost stand alone as a record of constantly descending prices year by year from its beginning to the present day. And I believe it is true that almost every company in the entire United States during the last 18 to 24 months has revised some of its rates downward, so that its average rates are each year less than they were the year before.

But everywhere, in addition to rendering useful service at a fair rate, these companies and the men and women engaged in them are taking a leading part in the development of their communities. Utility companies are generally regarded in their localities as the most constructive force in the upbuilding and progress of the territories they serve. Locally, they deserve and enjoy almost universal respect and esteem.

The story of the industry, its accomplishments, opportunities, purposes and policies will unfold as the program of the convention proceeds. It is an inspiring story, with new things happening year by year which gives most to its reputation.

Anybody can be president of the National Electric Light Association, if you show him sufficient partiality. He can't go far wrong with such an organization behind him to do the work for him and give him the credit.

I extend to you my very great thanks and appreciation for your partiality and kindness in conferring upon me the distinction of being President of the National Electric Light Association for this year. I shall cherish it always.

Accounting National Section Report

By J. F. Ford

Chairman, Accounting National Section, N.E.L.A.

Presented at the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

WE have been passing through one of the most strenuous years in the history of the electric light and power industry. In the many problems which have confronted us I feel that the Accounting Section has not been found wanting, and that we have gallantly and with fortitude met all the demands made upon us from our executives, the regulatory bodies, the Geographic Divisions and the National Association.

There has been marvelous progress in the past few years in our industry, and I feel the Accounting Section is entitled to some credit for keeping pace with all the advancements.

Persistent study and research by the several committees of the Section fully demonstrate that we are not lagging in the constructive and instructive work of the Association. This year, in my work as chairman of the Accounting National Section, I am more convinced than ever as to the importance of the accounting department of a public utility organization.

From the organization of a public utility through consolidations and mergers and all the many ramifications of financing, the accounting department functions as the only recording channel of all its activities, and is the steering wheel which guides the executive in his constructive thinking.

The accounting section must be alert and on its toes continually to meet the constantly changing conditions in the march of progress of the industry.

Debt of Gratitude

This association and the industry at large owe a debt of gratitude to the members of the several committees who have given so much time and energy in the preparation of the reports produced by the Section this year. When men of intelligence and ability, recruited from the national and geographic divisions, give their time and effort and are supported by their company executives, nothing but constructive results must be obtained.

The Accounting Section gives to those who take an active part therein a broader vision and an enthusiasm that is essential in the development of ideas. For this reason alone executives of member companies should encourage and see that members of their staff serve on these committees. Executives are strongly urged to allow their accountants to serve on committees, attend meetings and perform geographic and national association work. It is not only a distinct advantage to each individual company, but a great educator to its accounting staff.

J. F. FORD

Permit me to ask what better means has this great industry of ours for developing and improving its accounting systems than through the medium of the accounting section where the interchange of ideas is a constant source of improvement, which otherwise probably would remain undeveloped.

I have endeavored during my administration to establish a closer cooperation with all the other national sections. I have found that there are an infinite number of questions arising in the Commercial, Engineering and Public Relations sections which need our assistance and we need their assistance, so by closer affiliation we can be of infinite value to each other, to the Association and to the member companies.

The accountant today stands in a different light. He is beginning to be recognized as one of the essential parts of a public utility enterprise. The accountant today tells you where we have been, where we are now and where we are going. The accountants are the compasses by which the executives steer their course toward the harbor of successful results.

It had not been my intention to make any mention of the meetings of the Accounting Section during the year, but I feel that I can point with pride to the two very successful group meetings, at both of which the active interest and enthusiasm displayed by those in attendance were most remarkable. An innovation was adopted at these meetings in the form of general luncheon meetings—something new for the Accounting Section. These meetings were addressed by men prominent in the industry, who gave of their time to leave with those in attendance a message and an inspiration that was helpful to them in their daily tasks.

The serial reports that have been prepared by the various committees are a matter of record. They prove conclusively the valuable research work which has been done and are of unquestionable value to the industry as a whole.

Closer Contact with Other Groups

One of the most outstanding accomplishments of the accounting section in the past few years has been the establishing of a closer contact with the various sections of the Association and the Geographic Divisions and the benefits derived through these closer contacts undoubtedly accrue to the member companies.

I have been connected with the Accounting Section in many capacities for the past ten years and finally reached the goal of chairman of the Accounting National Section. My administration and activities in past years have led me more forcibly to the idea that men in the industry must work up to their opportunities and work faithfully and conscientiously toward this goal, as it is an honor to be classed as a chairman of the National Accounting Section and as past Accounting Chairman. It is an honor to which every accountant should aspire and executives of member companies should assist in seeing that their chief accounting officers have that ambition.

I have endeavored within my regime to meet all the conditions which have confronted this Section, have carefully selected assistants and outlined the work which was expected of them, and in every instance they have not been found wanting. I want now to thank in an humble way my able assistants, vice-chairmen, members-at-large and the chairmen of the several committees for their most loyal support and untiring efforts in making this administration the success it may merit.

In closing my administration as chairman of the Accounting National Section, I want to pass on to my successor that he continue those principles of expansion and development so ably carried on by my predecessors, and which I have tried in my humble way to expand dependent upon them for further expansion and to carry on this good work to a successful and inspiring fruition.

In closing this report I want to express my personal appreciation of the splendid support and hearty cooperation I have received from Headquarters; to Mr. Paul Clapp, who has shown by his personal attendance and talks before this Section his loyal and helpful support and suggestions; to Mr. A. Jackson Marshall, Secretary, who has given us every helpful suggestion and cooperation in our arrangement of meetings and programs; to Mr. Fred W. Herbert, Director of the Accounting Section, that untiring individual who is a stimulus for every chairman to put forth his best efforts and of whom too much cannot be said of his capabilities and willingness to serve, and to President Arkwright, who has devoted his time and energy toward stimulating interest in the Section.

In retiring as Chairman of the Accounting National Section I am not retiring in loyalty and further assistance, and I hope I may long continue as an active member of this Section and give what service, experience and advice I can to help toward further accomplishments.

I have given my time and services most willingly to this work the past year, and if I have given anything constructive I am most grateful, but I feel I have been fully repaid by the experience I have had and the most pleasant acquaintances which I have made. My best wishes for my successor are that he may get the same pleasure out of this work as I have, and I know he will get the same cooperation and assistance which has been accorded me during my administration.

Matthew S. Sloan

MATTHEW S. SLOAN, newly elected President of the National Electric Light Association, is president of five companies which comprise the largest electric light and power system in the world, The New York Edison Company, Brooklyn Edison Company, Inc., The United Electric Light and Power Company, New York and Queens Electric Light and Power Company and The Yonkers Electric Light and Power Company. This group of companies has 30,000 employes and serves a population of 6,443,000 in an area of nearly 700 square miles.

He was born in Mobile, Ala., Sept. 5, 1881, a year before Edison opened the Pearl Street Station in New York City. At nineteen, a graduate from the Alabama Polytechnic Institute, he took his first job in a public service plant in a small town in Alabama.

The next job was as pit man with the Memphis Street Railway Company. Six months later he became connected with the General Electric Company at Schenectady, N. Y., first in the apprenticeship test course and afterward as an outside construction engineer, installing General Electric apparatus for public utility companies.

From 1906 to 1914 Mr. Sloan was associated with the Birmingham Railway, Light and Power Company, first as chief engineer. Two years later he was made general superintendent in charge of engineering and operation, and from 1912 to 1914 was assistant to the president. He became operating manager of the New Orleans Railway and Light Company in 1914 and vice-president and general manager in 1916, holding that office until he came to The New York Edison Company in 1917 as assistant to the vice-president and general manager.

Aug. 1, 1919, he became president of the Brooklyn Edison Company. With the acquisition of the Brooklyn Edison Company by the Consolidated Gas Company, Aug. 28, 1928, Mr. Sloan was made president of The New York Edison Company also. He was elected president of the United Electric Light and Power Company on Sept. 4, 1928, president of the New York and Queens Electric Light and Power Company on Sept. 18, 1928, and president of the Yonkers Electric Light and Power Company on Nov. 12, 1928.

Mr. Sloan is also a director of these companies and is president and director of the Amsterdam Electric Light, Heat and Power Company of Brooklyn, of the Edison Construction Company, and of the Edison Light and Power Installation Company.

He is a trustee of the Consolidated Gas Company of New York, a director of the Bronx Gas and Electric Company, of the Westchester Lighting Company, of the Consolidated Telegraph and Electrical Subway Company, of the Bush Terminal Company, and of the Sloss-Sheffield Steel and Iron Company.

Mr. Sloan's public utility career has been characterized by his interest in the public relations of the utilities. In 1925 he was Chairman of the Public Relations Committee of the National Electric Light Association and with distinguished ability has served the association in other capacities. He is a past president of the Association of Edison Illuminating Companies and of the Empire State Gas and Electric Association.

He is active in civic and professional affairs. He is a director of the Brooklyn Chamber of Commerce, the Chamber of Commerce of the United States, the Coney Island Chamber of Commerce, the Long Island Chamber of Commerce, the American Standards Association, the Fifth Avenue Association, the Brooklyn Bureau of Charities, the National Security League and of the Park Association of New York City, Inc.

Mr. Sloan is trustee and treasurer of the Polytechnic Institute of Brooklyn and of the Long Island University. He is a trustee of the Brooklyn Hospital, of the Young Women's Christian Association and of the Museums of the Peaceful Arts. He is a vice-president and director of the Brooklyn Academy of Music. Mr. Sloan is a member of the American Institute of Electrical Engineers, the New York Electrical Society, the Academy of Political Science, the Merchants Association of New York, the New York Southern Society, the American Red Cross, the National Industries Conference Board, the Chamber of Commerce of the State of New York, and the National Association of Manufacturers. He is a member of the Executive Committee of the Empire State Gas and Electric Association, and an associate member of the Medical Society of the County of Kings.

His election as a director of the Guaranty Trust Company of New York April 18, 1929, connects him with the twelfth financial institution either as director, trustee or member of the advisory board.

Engineering National Section Report

By E. C. STONE

Chairman, Engineering National Section, N.E.L.A.

Presented at the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

AN OUTLINE of the activities and findings of the committees of the Engineering National Section was presented in my report to the Section at its session yesterday afternoon.* The report embraced more detail than would be of interest to this general session. At this time I wish to call your attention only to one or two of the matters covered, as follows:

All of the committees of the Engineering National Section have been in active operation during the past season, and have functioned with their usual effectiveness. The objective of "More System Capacity per Dollar of Investment" has been definitely reflected in their work, as is shown in the marked attention given to the development of designs and methods which will make for greater economies.

The increasing interest in this work is shown by comparative analysis of the organization personnel for the administrative years 1927-28 and 1928-29. The number of member organizations participating in the work of the Engineering National Section increased from 201 to 221 or 10 per cent, and the number of individual engineers having membership on the various committees increased from 550 to 630 or 14½ per cent.

"More System Capacity per Dollar of Investment" is emphasized because of the increasingly important part that fixed charges are playing in the total cost of electric power service. With fuel efficiency at its present high level, the cost of generation has become almost a minor item, so that system investment now offers the greatest field of opportunity for further major economies. In the past, attention has been centered on reducing fuel and other operating costs. In the future it will be devoted particularly to economical system design and control of construction costs.

New Committees

The two new committees, Power Systems Engineering and Special Engineering Research, which were organized last fall, have given a good account of themselves in the first year of their existence. The Power Systems Engineering Committee provides for study of the now very important subjects of system planning and design, and rounds out the organization to meet present-day conditions. This Committee has found a very definite, well crystallized, and uniform opinion among those executives who have developed planning organizations in their own companies that comprehensive future planning will bring about important savings in overall investment and operating costs, and therefore offers the definite recommendation that a planning development should be set up in every growing electric power utility.

E. C. STONE

The Special Engineering Research Committee, after making a comprehensive survey of the status of engineering research in the power industry, finds that there exists considerable duplication of effort which is wasteful of time and money, although entirely unavoidable under the circumstances, and concludes that proper coordination of research work in the industry can be best obtained by setting up a paid secretary at headquarters. The duties of such a secretary, who would naturally be placed in the Headquarters Engineering Staff, should be to maintain a complete file on research projects of interest, to arrange for adequate publishing of information regarding results as rapidly as they can be made available, to arrange for the initiation, placing, and financing of new and desirable research projects, and in general, to do all that a staff man can do to coordinate and guide research work so that it will be of maximum use to member companies.

The Executive Committee of the Engineering National Section has approved this recommendation, and it is earnestly hoped that appropriate provision for carrying it out will be made in next year's budget of the Association. The situation in respect to engineering research in the power industry is such as to make the adoption of this recommendation of primary importance.

An important step in standardization was made possible when the Executive Committee of the Engineering National Section approved the report of the Joint Committee of the N. E. M. A. and N. E. L. A. on preferred voltage ratings for alternating current systems and equipment. The adoption of the recommendations of this report generally by member companies will simplify the manufacturers' lines of apparatus, will bring about better adaptation of equipment to its service under prevailing conditions and will generally improve conditions for the interconnection of adjacent power systems. While the recommendations cannot be uniformly adopted at once, it is to be hoped that member companies will direct their system development toward the complete acceptance of the preferred voltage recommendations as soon as practicable.

Engineering Developments

Engineering developments during the past year have been along the line of better understanding of the problems of design and operation, and further refinements in equipment. The major radical development of importance was in the field of circuit interruption, where material advance has been made in the design of high duty circuit breakers not requiring oil. The so-called "Deion" circuit breaker has been successfully tested on a large power system.

Two major problems of power system engineering. system stability and lightning protection, have received much attention during the past year. Increasing interest in these subjects is logical, in view of the constantly increasing importance and volume of the power companies' business. Marked advances have been made toward satisfactory solutions of both of these problems.

---

*Editor's Note: June 4th. Progress reports of the Committees referred to have appeared from time to time in the N. E. L. A. Bulletin during the past year.

Considerable public attention has recently been directed toward electrical hazards in the home. This is probably because, while such accidents are very few, they are necessarily spectacular in nature when they do occur. Recent statistics of the National Safety Council, indicate that the chance of a fatal accident in the home from a fall is sixteen times that from electricity. Nevertheless, the Accident Prevention Committee has sensed the need for some sane recognition of this situation and prepared, with the cooperation and approval of the Commercial National Section and other interested parts of the Association, a safety in the home pamphlet under the title of "Common Sense." This pamphlet will be available shortly.

The booklet on "Resuscitation," prepared last year jointly with other interested organizations, has had a circulation unprecedented for N. E. L. A. publications. Including reprints issued by insurance and manufacturing concerns this circulation has reached into the millions. The work of the industry in educating the public in methods of resuscitation is having a very beneficial effect in building public good will.

In recognition of the probable engineering requirements in connection with the intensive load building effort that will be put forth in the next few years, the Utilization Subcommittee was created this year in the Electrical Apparatus Committee to deal with the problems involved in the utilization of electrical energy including the engineering of present applications and the development of new uses. During the past years the Headquarters Staff has cooperated with the Commercial National Section in dealing with problems of wiring, oil burners, and water heating.

The Headquarters Staff

The Headquarters Engineering Staff, under the direction of Major H. S. Bennion, is now very effectively organized, and although undoubtedly undermanned, has given an excellent account of itself during the past year. The engineers of the Staff are at the same time the sentinels and ambassadors of the industry in engineering matters. On the one hand they keep in close contact with the activities of many other organizations whose work may affect our interests and promptly bring to the attention of the proper parties all matters on which action may be required. On the other hand they constitute an official point of contact with outside organizations and provide a channel for effective cooperation in engineering matters. Thus they not only protect the engineering interests of the power industry, but also make possible the cooperation of our industry with others in such a way as to bring about coordinated physical development and general good will. The engineers of Headquarters Staff are doing well a very important work, particularly in the code situation and on the problems of coordinated construction with other utilities. They should receive generous support and be permitted to expand their organization as the growing industry they represent throws additional burdens upon them. For example, last winter in accordance with the recommendation of President Arkwright, company code representatives were designated by many member companies to serve as channels for information to and from Headquarters direct to member companies. The arrangement throws an additional heavy task on Headquarters Staff to maintain this contact, but the records which are being built up as a result of this plan and the solidarity which results from the closer contact is going a long way toward solving the code problem which has been confronting the industry in recent years.

Geographic Divisions

The engineering committees of the Geographic Divisions have made further progress during the past year in finding themselves, and their activities have been more extensive and more effective than heretofore. With the more definite understanding of their purpose and scope, the geographic organizations are being molded to specifically meet the local conditions. While the national organization is being used as a guide, each division is setting up only those committees in which it has a direct interest, while in some instances special committees have been organized to meet special conditions. This is as it should be. Such encouragement and advice as appeared useful has been given by the officers of the National Section to the geographic organizations. The chief recommendation has been maximum simplicity of organization to meet clearly defined local requirements. In the working out of geographic engineering activities, a definite trend has been noted toward the conference form of activity. That is, the various engineering committees of the respective divisions have met together once or twice a year for general conference and exchange of ideas. Definite programs have been prepared in advance with carefully selected and well qualified speakers to cover the subjects set up for discussion. These programs have been advertised in advance. The result has been most gratifying, and indications are that this method of carrying on divisional work will be generally adopted. Very favorable comment must also be made of the valuable serial reports on timely engineering subjects which have been prepared by a number of the divisions. These reports form an important part of the work, but after all must be considered secondary to the major purpose of bringing together the engineers of the various companies for interchange of ideas and discussion of mutual problems.

Standardization

One of the objectives of the Engineering National Section is constructive cooperation in the national movement for standardization. It seems evident that standardization affecting the power industry up to the present time has been generally advantageous, and has resulted both in economy of power production and in extension of power uses. There may, however, be a possibility in our present enthusiasm for standardization of allowing the pendulum to over-swing. The kind of standardization which established frequencies, utilization voltages, ratings of the equipment, factors of safety of equipment, has been a major factor in developing the use of electricity in this country. In the field of simplification, however, which results in a reduction in the capacities of equipment or qualities of material available, the immediate result is a less close adaptation of the available products to the service for which they are to be used. This fact alone means some economic loss. On the other hand, the results of simplification bring about economies, such as reduced costs of manufacture, reduction in stocks to be carried, and so on. It is thus necessary to balance the advantages and disadvantages of a given standardization project of this kind in order to determine its true economic value.

The major purposes of standardization, to effect economies and extend use of product, must be kept in mind in setting up the standardization program. It is suggested that the Engineering National Section during the coming year should give study to the subject of standardization, with a view to determining the lines along which standardization may be prompted to best advantage and wherein overstandardization with economic loss is a possibility.

A report on the work of the Engineering National Section would not be adequate if it did not call attention to the very valuable serial reports which are published from time to time by the various committees of the Section. These reports together constitute a complete, up-to-the minute exposition of the latest and best engineering practices and methods of the electric power industry throughout the country, and are authoritative because they are compiled by the members of the engineering committees,

Convention Impressions

By An Observer

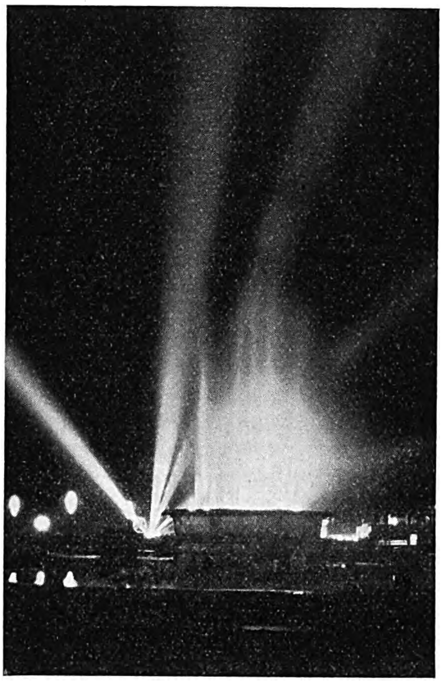
I THOUGHT I had attended conventions. In fact, for some years, I have thought there was little about conventions that I did not know. For a long time I have been quite sure that given a subject and a list of delegates, I could pull off a successful convention anywhere, under any conditions, and in any known language.

And so I approached the 52nd convention of the National Electric Light Association with a distinct feeling of boredom. "I had seen so much of this sort of stuff, you know, and there couldn't possibly be anything new about it."

Now I am back in New York having reached but one definite conclusion. Until June 4, 1929, I "hadn't been nowhere and I hadn't seen nothin'." I am in thorough accord with the oft-repeated statement made by Preston S. Arkwright, that this was not just another convention. It has never been held before and will never be held again—at least, not in the lifetime of those who were present.

INNUMERABLE times during the week the expression "Press Arkwright has certainly had all the breaks," was heard. Personally I am of the belief that Providence must have taken a special interest in him from the time that he was born and knew that he would be elected President of the Association for 1928-29. And because of this special interest Providence caused the incandescent lamp to be perfected by Edison in 1879 so that Light's Golden Jubilee would come during his term of office. Then for the sake of consistency if nothing else, Providence must have inspired former Mayor Bader of Atlantic City to dream his dream of a great Auditorium which would be a monument to this wonderful seashore resort and arranged it so that this dream might come true in 1929. Yes, Press Arkwright may have had all the breaks but it wasn't all just "luck." There is something bigger than luck behind the birth and growth of a great industry which in the short span of fifty years can erect by the side of the road on which it is traveling such a milestone as this convention and I suspect that Arkwright had much to do with the construction of this background.

If I am to make the effort of recording my impressions—and this seems to be what the editor of the N. E. L. A. BULLETIN desires—I must start with Atlantic City's beautiful new convention hall, which was christened by this convention. There may be somewhere in the world a great writer or, perhaps, a great painter who is able to picture the grandeur of this building in such a fashion as to present an adequate picture of it. I confess I am neither that writer nor that painter. No words of mine can ever do it justice. There is nothing like it in the world and it will be many, many years before anything is built for a similar purpose which will surpass it.



Fountain of Light erected in Atlantic City by General Electric Company in celebration of Light's Golden Jubilee

Built of Indiana lime-stone and brick, and stretching for a block along the Boardwalk and back to Pacific Avenue, its magnificence is only equaled by its Gargantuan size. They tell me that the Main Auditorium will seat 41,000 people comfortably, the ballroom 6,000 and that if these two rooms, together with the innumerable committee rooms, are all in use, 66,000 persons will be sitting down and there will be left plenty of room in which to move around. This is more than the entire permanent population of Atlantic City.

They tell me that a thirteen story building, five hundred feet long and 200 feet wide, can be placed in the Main Auditorium, leaving more than a hundred feet on all sides to spare and that if Babe Ruth stood on the stage and knocked the longest home run he has ever made, the ball would fall far short of the other end. Personally I believe it all and a great deal more. The publicity man, one Frank Hartnett, has like all publicity men, been extremely modest. If I had his job the things I could find to say would cause my friends to have me examined by an alienist. But all I would be doing would be telling the truth.

There is one complaint which I have to make about this building and it has to do with the question of geography. The distances are so great that if one makes a mistake he is fairly well sunk. Twice the first day I tried to go from here to there, that is to say, from one set of offices to another, and I finished outdoors with the necessity of going around to the main entrance and starting all over again. I understand that many delegates, plus some very high officials, had the same experience and were somewhat annoyed thereby.

Having paid my respects to the convention hall without in the least trying to describe it, I suppose I should turn to the exhibits which were housed in the Main Auditorium. Reminiscing once more about conventions that I have seen I do not believe that any industry has ever held an annual meeting accompanied by any such exhibit of the goods it has to sell. There were more than 200 of them and they included everything which had to do with the generation, distribution and utilization of electric energy. One could have spent a week profitably looking them over and when he got through he would have had an intensive education in just what this light and power industry means.

BUT to get back to our "mutton and ale" as we say in dear old "Lunnon." The show started off with the inauguration of Light's Golden Jubilee by President Arkwright on Friday night, May 31. This came off according to schedule and was exactly as advertised with a lot of additional fixings. President Arkwright made one of his characteristic speeches, which always lifts his audience on its toes, and then pressed a button as all Presidents do when they are starting something, whether it is a special message to the Congress of the United States or opening a World's Fair. Instantly the Aurora Borealis sprang into being and the Boardwalk, together with the great Boardwalk hotels, which had been dark, were a blaze of lights. The bands played; a cannon roared a salute of 21 guns; everybody cheered; and the international celebration in honor of Thomas A. Edison which will last until October 21, was in full swing. The light and power industry mentally pinned another medal on its retiring president and set about its immediate business which was to have a good time for three days before settling down to the serious purposes of the convention.

It is by no means my intention to give in these columns a formal description of the convention. This will be found on other pages of the BULLETIN. Instead I propose to record a few of the side lights—the sort of thing which is not spot news and, therefore, does not appear in the newspapers, and which but few people have the opportunity of observing in such a way that they can appreciate the mechanics of an affair of this sort. The convention itself I will dismiss with the statement that it lasted for four days and consisted of four general sessions, four national section meetings and innumerable other meetings of national committees and little private gatherings of kindred souls. Nor do I propose to pay much attention to the Big Berthas—the headliners. They got quite enough publicity in the daily newspapers.

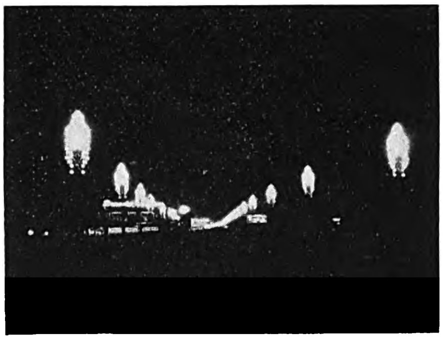
The first item of interest to the individual attending a convention of this kind, with or without his family, is the question of hotel reservations. Now it is something to handle reservations for more than 12,000 people without at least a few mix-ups, and without some folks having a few anxious moments wondering whether or not they are going to sleep on the beach. Yet this seems to be exactly what was done and, as I understand it, by the efficient Miss Woods, of Secretary Marshall's office. At least one heard nothing but compliments on every side.

IT is quite a nice trick to register more than 12,000 people—everyone of whom is in a hurry—in two days, check their pedigrees, see if they are entitled to registration or not, ease them around to the cashier, the philosophical Miss Downey, in order that she may collect tribute, record the hotels in which they are stopping, provide them with badges so that they can get in and out without being arrested for trying to crash the gate, and answer a multitude of questions, ranging all the way from such questions as "do you know whether John Jones is here and where is he stopping, if so?" to the best place to buy a straw hat. Yet 12,000 people passed through the N. E. L. A. registration booth in a little more than two days as easily as a drove of sheep going down a greased shute.

It is not an easy matter to handle space for 216 exhibitors—even when the available space is measured in acres rather than square feet—and make them all happy. Yet this was done through the office of Miss Lisota, assistant secretary of the Exhibition Committee, and she did a great job. Like the convention itself, nothing like this exhibit of the light and power industry has ever been seen before. The decorations and arrangements were quite as remarkable as the exhibits themselves.

The publicity of a great convention is always something of a problem. Some conventions make news and some don't. This convention, fortunately, created an enormous amount of news as witness the amount of space given to it by the daily press. But it is a big job to make this news quickly available sufficiently in advance to have it given a proper play. In this instance a press summary of practically every speech, as well as a running story of every general session and of every Section meeting, was given out to the newspapers in mimeographed form, well in advance, and at the same time, the full text of every speech was given to those who wanted to pay especial attention to some particular subject. The mechanics of this work, which involves an enormous amount of detail, were handled by Miss "Lou" Bioni, called the "City Editor" by the newspaper men, who bossed everybody, including George Oxley himself, as I suspect Miss Woods bosses "Ajax" Marshall, the Secretary of the Association, or as Miss Downey bosses George Francis, the Assistant to the Treasurer, or as Miss Lisota bosses the Exhibition Committee.

In connection with publicity for a convention of this sort it is worthy of note that it takes a real program to make spot news and a large wreath should be handed to everyone who had anything to do with the construction of the program of this particular convention. Putting the full text of all of the speeches, the reports and the statements made together, one has a text book on the light and power industry, such as no single author could ever hope to write. It constitutes at one and the same time a great history, a social and economic philosophy, a religion, if you please, and a declaration of principles and ideals of which any industry might well be proud.



And because such a text book is something so much more than the usual collection of platitudes and bromides, one hears at the average national convention, it is destined to become an outstanding classic among the literature of the light and power industry.

No "impressionistic" story of this convention would be complete without some mention of the movietones which were shown each day during the general sessions. Mr. Edison, although at his home in Florida, was there in person on the screen and addressed the delegates in a strong, vigorous voice. Sir Ernest Benn, the noted British economist and publisher, stood in the garden of his summer home near London and through the medium of a talking film, expressed most emphatically his views on the subject of private ownership and operation, registering opposition to all forms of public ownership. His Excellency, Dr. Alberto Pirelli, President of the International Chamber of Commerce, greeted the convention and paid a graceful tribute to Thomas A. Edison, from his home in Milan, Italy. Sir Kengo Mori, Chairman of the Japanese Committee of Experts to the Reparations Conference in Paris, told about electrical development in Japan and what it means to his country.

PERHAPS the most remarkable thing about the convention was the attendance at the various sessions. A convention in Atlantic City is always a problem—there is so much to do and so much to see. Yet the great ballroom of the convention hall, where the general sessions were held and which seats comfortably 6,000 people, exclusive of the balconies, was filled to over-flowing every day and, what is even more interesting, the people stayed until adjournment, even though the session ran well over luncheon time. I am told that the section meetings were attended in the same way.

It was a serious convention. It was a sober convention. I make this second statement in no spirit of levity. Too many people have the impression that a national convention is only an excuse for a variety of good times. It was not so in this case. These people were there meaning business and to get everything out of the week that they could. As a waiter in the Traymore said to me: "'Deed boss, ah never did see so many big men at a convention. Dey's all bosses and dey means business—dey ain't foolin'."

That waiter voiced the spirit of the convention. This 52nd convention of the National Electric Light Association, held on the occasion of the 50th anniversary of the birth of the practical incandescent lamp, was making history and there wasn't any "foolin'."

Sales Increase or Rate Increase

By M. S. SLOAN

President-Elect, National Electric Light Association

An Address before the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

THE title I have chosen for this paper is not intended to indicate an alarmist state of mind. It is intended, however, to call to the attention of our industry facts which seem to me worthy of our careful study. The situation is not at present one which should alarm us. It should not be permitted to get to a point where it does become alarming.

Trends in our industry over a period of several years show that it is slowly being squeezed between the jaws of a pair of pincers.

One jaw is a decline in the kilowatt hour sales and revenue for each dollar of investment.

The other jaw is a rising investment per kilowatt of installed generating capacity.

In spite of this squeezing, our rate of return has lowered only slightly in the period under consideration. The return has thus held up because of a splendid steady increase in operating efficiency produced by our engineers, and economies in financing and other phases of management produced by consolidations and groupings of operating companies. The excellent financial showings the electrical utilities in general are able to make at present are a tribute to technical progressiveness and administrative ability. They must, in time, however, reflect the trends in sales and investment if those are not corrected.

The figures I am using in this paper were collected by the Statistical Department of our Association from its own records, and data of the Census Bureau. They cover the entire electricity supply industry of the country, with inter-company sales eliminated.

In 1922 there were sold 7.54 kilowatt hours for each dollar invested in plant and equipment. In 1927 this figure dropped to 6.61 kilowatt hours, a decrease of 12½ per cent.

The average price per kilowatt hour sold in 1922 was 2.81 cents, while in 1927 it was 2.71 cents, a decrease of 3½ per cent.

The revenue for the dollar of investment in 1922 was 21.1 cents. In 1927 it had decreased to 17.9 cents, or 15 per cent.

The 1922 rate of capital turnover was once in 4.72 years. In 1927 it was once in 5.58 years, or 18 per cent longer.

In this period, from 1922 to 1927, the installed generating capacity increased 78 per cent. The average generation per kilowatt installed increased 4 per cent. The investment per kilowatt installed increased from $312 to $367, or 17½ per cent.

The balance available for interest, dividends and surplus showed an average rate of return for the industry in 1922 of 7.58 per cent. In 1926 it was 7.30 per cent. In 1927 it was 7.48 per cent.

In order that these facts may be seen in their proper relationship, it is necessary to interpret them by the introduction of paralleling facts. As we all know, there have been, in recent years, many rate reductions, particularly in domestic or household rates. As an industry, we take pride in the fact that electricity is the only item in the cost of living figures, compiled by the Federal Government, which is lower now than it was before the World War. That, in part, at least, accounts for the steady decrease in the revenue received for each dollar of investment.

SINCE the War, our industry has carried on a tremendous building program. In the last few years, which have been a period of great business activity, general prosperity and easy money—that is, capital readily available on good terms for enterprises of merit—we have vastly enlarged our plant capacity and transmission and distribution equipment. As an industry, we have invested in such extension each year three-quarters of a billion dollars, or more. We have made up for any deficiencies of construction during the War period, and have built ahead of demand, as it was our duty to do. We have built into less densely populated territory, into the smaller and more remote communities, into rural districts, to reach farm customers wherever practicable. The net result of that has been that cost of transmission and distribution facilities have been heavier in proportion to the unit of energy sold than when we were dealing with large city groups, or even the average of urban population.

This condition will continue. In very large degree, the urban population of the country is now on our lines. Aside from the natural growth of population, the new customers we shall obtain will be those in the outlying districts, so it is not reasonable to suppose that investment costs will turn downward.

Now with those elements taken into consideration, what do our figures show us?

First, the average revenue per kilowatt sold to the ultimate user is just about stabilized. The tendency, however, is downward.

Second, the trend of revenue in relation to the dollar of investment is distinctly downward.

Third, the time of capital turnover is markedly lengthening.

Fourth, the investment per kilowatt of installed generating capacity is increasing.

Fifth, the return on the investment has been approximately stabilized since 1922.

On that showing, the question "Shall we increase our sales or our rates?" becomes distinctly and sharply pertinent.

There can be but one answer to that question. We do not want to seek rate increases. We want to continue the course of our industry's development, which has been marked by a steady decline in prices charged for service. We could not afford to raise the prices now even if we did want to, for such a policy would inevitably decrease our sales and antagonize the public.

The answer to this question then is that we must increase our sales. We must sell more kilowatt hours for each dollar of investment, making our equipment work harder and steadier, and the place to sell more service, in my judgment, is in the home. There are nineteen million homes on our lines. The average use of electricity in these homes is figured at 460 kilowatt hours during 1928. That represents an increase of 30 kilowatt hours over 1927, which year produced an increase of 25 kilowatt hours over 1926. It is gratifying that there were these increases, yet their size really does not seem anything to cheer about.

This figure of 460 kilowatt hours, please remember, is the average for the country. In many districts of the country it is exceeded largely. There are, for example, annual sales of 546 kilowatt hours at an average price of 4.94 cents, of 580 kilowatt hours at 4.52 cents, of 577 kilowatt hours at 4.87

cents, of 717 kilowatt hours at 4.88 cents, and 735 kilowatt hours at 3.3 cents.

It is obviously not likely that every electric utility can equal such sales. It is distinctly possible, however, for most companies so to increase their domestic sales that the average for the country will jump a good deal more than 25 or 30 kilowatt hours a year.

Domestic sales should be vigorously stimulated for several reasons. The first is that they are and always will remain the backbone of our business. Industrial use of electricity, and, to a somewhat less extent, commercial use, will fluctuate with the state of business health of the country. We have seen this in recent years. In 1922 industrial sales were about 6 per cent below the average. In 1926 they were about 6 per cent above.

THERE is very little fluctuation in domestic use of our service. Household habits become fixed. A household accustomed to the convenience and value of electricity will curtail its use only under the direst necessity. When we add to the domestic load, therefore, we put on what amounts to a permanent increase in business.

Another reason is that domestic business is highly desirable business. Once the customer is beyond the point of use, which pays for the fixed expenses of serving him, the chief expense incurred by the company in furnishing additional kilowatt hours is that of generating the energy. Moreover, increased domestic load is an important element in improving the company's load factor.

The third reason is that the customer who makes the largest use of service is, in all human probability, the best satisfied customer. We seek to improve our relations with the public by furnishing information about our business, by public speaking, by advertising.

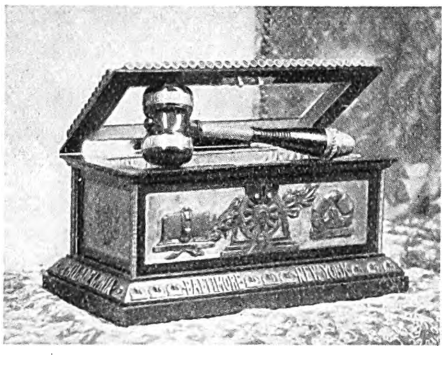
We have every possible incentive to create a body of customers in homes all over the land who are using so much service and getting so much comfort and convenience out of the use of service that they thoroughly and genuinely appreciate its worth.

A fourth reason is that we have a social duty to increase the domestic use of electricity. Electric utilities are not alone business enterprises. They are also organizations for public service. They obtain their franchises on that basis. With them they acquired certain responsibilities. One of these responsibilities, as I see it, is to do everything possible to make their service most widely useful to the public. Naturally, as a matter of plain ordinary business policy, we seek to sell as much service as we can. My point is that we have for sale more than kilowatt hours. We have for sale comfort, convenience, time saving and freedom from drudgery. We have for sale better home conditions, higher standards of living.

IT is our privilege and duty to approach our sales problem from that point of view as well as from the point of view of increasing our revenues. If we neglect it, we may be sound business organizations but we fail to live up to our responsibilities as public utilities. Our industry has been criticized not a little on just that point, and I think we deserve the criticism in exactly the measure in which we omit any effort, practices or policies, which may properly be adopted to make electric service more used and more useful in the home.

It seems to me more than a coincidence that in every case I know of a reduction in domestic electric rates has been followed by increased use of service. There may be instances where this was not true, but they have not come to my attention. It was true in Brooklyn under conditions which covered a series of reductions over a period of several years. It has been true in up-state New York, in New England, in the Middle West, and on the Pacific Coast. Those companies which show the highest annual domestic sales also show the lowest rates. We have, therefore, in the experience of our industry what may be accepted as a guiding principle in stimulation of sales of service for domestic use. The way to increase such sales is wisely and properly to lower the domestic rates.

Moreover, there is within the experience of the industry in recent years a guide to the general form of rate schedule effective in increasing domestic sales rapidly, what has come to be known as the inducement rate. In this there is either a minimum charge or a charge for the first few kilowatt hours at sufficient rate to cover the fixed charges of serving the customer, after which comes a kilowatt hour charge lowering rapidly as the use of service increases.



The Historic President's Gavel of the Association. Presented in 1888 to the Association's First President, Frank W. Morrison.

You are all familiar with the theory itself, whatever its variations in rate structures for particular localities. This theory works. Such a rate schedule actually does what the name indicates. It induces larger sales of kilowatt hours, and that, it appears to me, is what we are all after.

For a number of years we have been patting ourselves on the back over the million and a half new homes brought on our lines each year. In truth, the figures have represented a high tribute to the value of electric service and have been something about which we might properly be gratified. Yet, having obtained these customers, we have not been doing our full duty to our companies in respect of them, neither have we been doing our full duty to them. We have not been selling these customers all the electric service they could profitably use in the various processes of running a modern household.

Here with our nineteen million domestic customers is a field to cultivate which will yield us, properly cultivated, more sales to the dollar of investment without adding to that investment; which will increase the average revenue to the dollar of investment, even on lowered rates; which will tend to shorten the time of capital turnover; which will produce a practically permanent increase of sales not subject to the fluctuations due to business depression. These advantages we stand to gain, plus the great and valuable advantage of having this enormous body of customers better satisfied with our service because it is doing more for them.

HERE is a situation, it seems to me, which concerns all companies in our industry, because, however well any may be doing in respect of domestic sales, none has reached the limit of possibility. Indeed, who can tell what the limit is when Mr. Edison himself says that electricity will not have done its full job as long as humanity uses for any tasks some agency which electric service could better. Obviously each company will have to meet this situation according to its own local conditions and in its own time and manner. Each company, however, will have to meet it. Our nation's standards of living do not stand still. They are constantly being revised upward. Society's demands upon our industry do not stand still. They also are constantly being revised, and on the whole I believe in no unfair spirit.

Clearly, the demand now is for a way of making possible more use of electric service in the American home. That demand coincides with our need as an industry, and there is within the industry the experience and general indication of how to meet it with mutual benefit.

Prize Awards Made at the Convention

THE El Paso Electric Company, El Paso, Tex., was awarded the Charles A. Coffin gold medal at the Public Policy Session for having made during the past year the most distinguished contribution to the development of the electric light and power industry for the convenience of the public and the benefit of the industry. In addition to the coveted honor and the gold medal, the El Paso Electric Company receives a cash prize of $1,000 for the company employee benefit fund.

Kilowatt-Hour Contest

Nine thousand dollars was awarded to six winners in the Commercial Section Kilowatt-Hour Contest at the Wednesday afternoon session of the N. E. L. A. on June 5. Three first prizes of $2,000 each were awarded, and three second prizes of $1,000 each.

The contest was participated in by sales departments of class A companies, the prize being for the largest increase in total average annual kilowatt-hour consumption per residence customer, with the objective of attracting attention to the possibilities of increasing domestic use of electricity.

The contest was divided into three classes, based on the total average consumption of each company for the year 1927. Class A was for companies with an average of 451 kw-hr. or over. The first prize was won by the Cheney (Wash.) Light & Power Company, which developed an average increase from 491 to 686; the second prize by the San Joaquin Light & Power Corporation, Fresno, Cal., for an increase from 625 to 724.

Class B embraced companies with an annual consumption for 1927 from 351 to 450. The first prize was won by the Alabama Power Company, Birmingham, on an increase from 433 to 496; the second prize by the Western Public Service Company, Scotts Bluff, Neb., on an increase from 387 to 449.

Class C was for companies with a 1927 average of 350 kw-hr. or under. The first prize was won by the Central Power & Light Company, San Antonio, Tex., for an increase from 256 to 415; the second prize by the Western Public Service Company, Beaumont, Tex., with an increase of 264 to 367.

The following honorable mentions were given: Class A, Portland (Ore.) Electric Power Company with an increase of 93; Class B, Durham (N. C.-Public Service Company with an increase of 58, and the Southern Colorado Power Company, Pueblo, with an increase of 54; Class C, Annapolis & Chesapeake Bay Power Company with an increase of 100; Montana-Dakota Power Company, Minneapolis, with an increase of 84.

Federal Electric Prize

The Federal Electric Company prize of $1,000 for electrical advertising went to the Edison Illuminating Company of Boston.

Forbes Cup

The Forbes public service cup for 1929 was awarded to the Puget Sound Power and Light Company for the most distinguished work in the field of public relations.

N. E. L. A. Prize Awards

The prizes which have been offered annually by various donors for the best papers on subjects relating to the electric light and power industry were awarded this year as follows:

H. L. Doherty Gold Medal

"Investment Merit of the Electric Utility Industry." Everett W. Vilett, Public Service Electric & Gas Company, Newark, N. J.

Harriet Billings Award

"The Human Side of a Balance Sheet." P. O. Johnson, Northern States Power Company, Minneapolis, Minn.

Martin J. Insull Award

"A Public Relations Yardstick." Rob Roy MacLeod, Buffalo, Niagara & Eastern Power Corporation, Buffalo, N. Y.

James H. McGraw Awards

1. "Operating a Hydro-Electric System for Best Economy." E. B. Strowger, Niagara Falls Power Company, Niagara Falls, N. Y.
2. "The Electric Water Heater." H. George D. Nutting, Detroit Edison Company, Detroit, Mich.
3. "Peak Load in Steam Plants and Its Economical Generation." Francis Heisler, Public Service Company of Northern Illinois, Chicago.

J. E. Davidson Awards

1. "A Study of Merchandise Advertising." Keo Currie and Ray Warren, Public Service Company of Northern Illinois, Chicago.
2. "Specialized Merchandising for the Central Station." Donald D. Parry, Central Hudson Gas & Electric Corporation, Poughkeepsie, N. Y.
3. "Winter Humidity and Comfortable Homes." Edwin Fleischmann, Niagara Falls Power Company, Niagara Falls, N. Y.

H. M. Byllesby Awards

1. "Six Words in an Accountant's Life," by William A. O'Neill. Electric Bond & Share Co., New York, N. Y.
2. "How to Increase the Usefulness of the Accountant in the Public Utility Industry," by F. L. Barry, Electric Bond & Share Co., New York, N. Y.
3. "The Accountant in the Public Utility Industry," by Harold V. Bright, Southeastern Power & Light Co., New York, N. Y.

Frank W. Smith Educational Award

Raymond H. Young, Public Service Electric & Gas Company, Camden, N. J.

Coffin Award

Marked reduction in investment per dollar of gross revenue, increase in average load of domestic customers, development of lighting load, increased service reliability, exceptional over-all plant efficiency, excellent customer and employee relations, a wonderful safety record, and development of rural service are the major achievements which won for the El Paso (Texas) Electric Company the "Charles A. Coffin Award" for 1929.

The territory served by this company embraces El Paso, Texas (600 miles distant from any city of equal size), Juarez, Mexico, and the rural region extending 120 miles up and down the Rio Grande Valley. The population served is 148,160, about 50 per cent of which is Mexican. There was an 8 per cent increase in population during 1928.

The achievements on which the award were based are summarized below:

Investment Per Dollar Gross Revenue

$3.47 in 1928, $3.59 in 1927—a 3.3 per cent increase in earning power.

Average Load of Domestic Customers

6.9 per cent increase, despite 7.5 per cent gain in new customers; 30 per cent increase in merchandise sales; district representative plan increases per capita sales 200 per cent.

Lighting Load

Illuminating engineers made important additions to street lighting, electric signs, lighting of outdoor sports, aviation field illumination, as well as window and building lighting.

Reliability of Service

Greatly improved by rehabilitation of isolated plants acquired, extensions and improvement, centralized dispatching, reorganization of trouble department, double feeder lines to important customers, radio communication, automatic signal systems.

Over-all Efficiency

Over-all efficiency of power plant increased 2.4 per cent and cost of net kilowatt-hours delivered reduced 8.28 per cent.

Customer and Employee Relations

Better service slips and letters from customers show great improvement in relations. Actively participate in all civic enterprises. Affording every opportunity for self-improvement and advancement has developed loyal, efficient, courteous employees.

Safety Record

With 205,000 man-hours devoted to distribution work and autos traveling 366,000 miles, lost-time accidents have been reduced to surprisingly small amount. Regular safety meetings and demonstrations.

Rural Service

With faith in future company has made large investments to render service. Long-line extensions made to encourage irrigation and reclamation of waste land, with subsequent increase in population and added loads. Numerous farms, dairies, cotton gin and oil mills.

Light's Golden Jubilee

By PRESTON S. ARKWRIGHT

President, National Electric Light Association

An address made at the Dedication Ceremonies opening the Atlantic City Auditorium, May 31, 1929

THIS is the inaugural of Light's Golden Jubilee.

All over the world, during the year, will be celebrated the fiftieth anniversary of the invention of the electric incandescent lamp, which was first successfully demonstrated by Thomas A. Edison, its inventor, at Menlo Park, N. J., on Oct. 21, 1879.

With its coming the terrors of the dark were banished; useful time lengthened; available space widened; waste reduced; efficiency increased, and the safety, convenience, comfort, happiness and usefulness of mankind enlarged.

It is the only artificial light without flame. It sends its beams out steadily in the gale and shines brightly in the closet. It leaves the air unpolluted, with its life-giving elements undespoiled and its temperature practically unaffected. It is a rose without a thorn. Evil shuns it, and goodness and purity flower in its glow.

Wherever available—and that means almost everywhere—electric light is now the universal artificial illuminant. So useful a need did the electric incandescent lamp fill that two and one-half billion of its fellows are in use today.

But vastly improved are they—in appearance, in ruggedness, in longevity, in economy, in efficiency and in adaptability for varied uses. The improvement in the lamp, combined with the wonderful development of the electric industry following in its wake, has brought such great reduction in its price that its enjoyment is now within the reach of any pocketbook. It is the cheapest light the world has ever had. It is one hundred times cheaper than candle light, many times cheaper than oil light, and it costs less today than ever before. The cost of the one candle on the baby's first birthday cake is many times more than the cost of lighting with electricity the whole dining room for the party. Indeed, electric light actually costs less than natural light inside the house. Natural light in the great outdoors is free, but it costs money to bring it in behind the walls. Not only is it cheaper, but electric light is better than daylight. Daylight is timid about entering the room, and hovers around the windows. Electric light will penetrate the farthest corners and shine with undiminished brightness wherever you want it.

The idea of the lamp in Edison's brain, or the experimental model in his laboratory, would serve no useful purpose. It must be made available for general use. So Edison invented, organized and established the first electric central station.

Thus, out of the lamp has come the electrical industry, serving at first a limited area in the most congested section of our largest city, and growing by leaps and bounds through the short years, until we now have electric central stations with their long-distance transmission and interconnected systems, supplying house-to-house electric service for lighting, heating and power purposes to over 23,000,000 customers in the United States alone, distributed the country over in practically every city, town and hamlet, and rapidly spreading to the farms.

Niagara Falls Golden Jubilee Celebration

Bathed in a glow of golden light, Niagara Falls will play host to a crowd of visitors estimated at 100,000 from June 13 to 16, when the first civic celebration of Light's Golden Jubilee, following the National Electric Light Association Convention, will be staged.

The celebration will be the more impressive because it is coincidental with the marking of three other anniversaries—the Fifth Annual International Festival of Lights, the 50th Anniversary of the first generation of electricity from the waters of Niagara and the 250th Anniversary of the discovery of Niagara Falls by the white man.

All the street lights on the main thoroughfares at the city of Niagara Falls, N. Y., will be changed from white to golden hue.

Scores of retail business places will be decorated to show in contrast the lighting effects of 50 years ago and those of today.

Improved lighting, golden in color, will be applied to gasoline-service stations and similar places.

The Queen Victoria Park Commission, through W. D'Arcy Ryan of the General Electric Company, is arranging for an aerial drill and golden effects to be produced by the 24 immense searchlamps which illumine the Falls nightly.

The General Electric Company will transfer its broadcasting program over WEAF on Saturday, June 15, to Niagara Falls.

Almost every day brings new applications of the service—new devices to take the place of human drudgery, to lighten and brighten the work of living, to multiply the output of the factory and the earnings of the workman, and to take away the physical tasks of the home.

No wonder that all over the world the fiftieth anniversary of the birth of the electric incandescent lamp is celebrated. The celebration consists primarily in merely giving opportunity for the light to show forth itself. Tonight, here in Atlantic City, is a Festival of Light. In full brilliancy, in all the colors of the rainbow, it will spray the heavens, scintillate on the waves of the ocean and cast its splendor on the earth.

The place and the time are the perfection of appropriateness. Germinated in the brain of a citizen of New Jersey, and brought to fruition on its soil, the electric incandescent lamp cast its first ray into the air of this State.

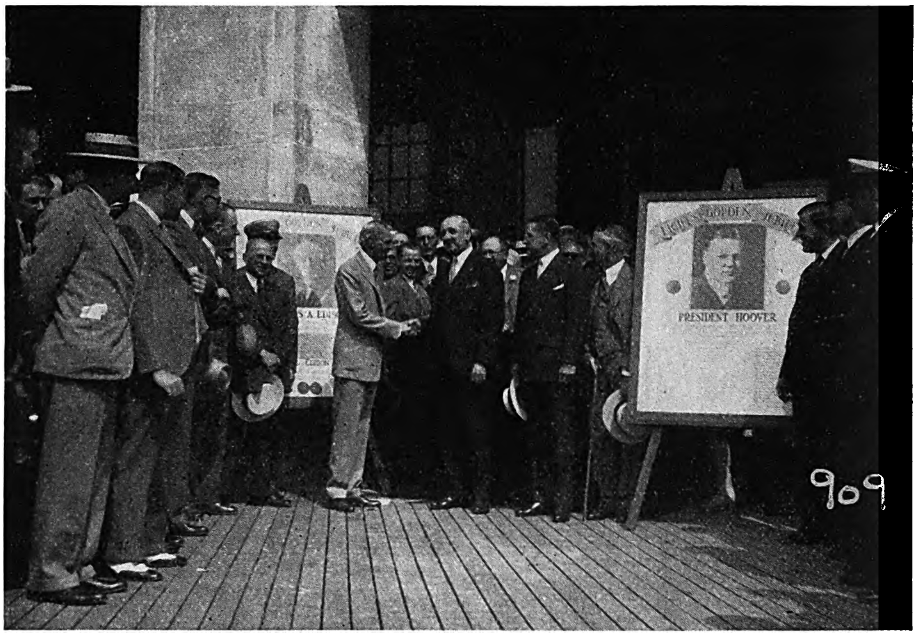
A large proportion of these lamps now in use are manufactured within and by the workmen of this State.

Within the State is a place of national restoration where tired bodies are restored to vigor, dulled brains are made alert again, and despondent souls are filled with new enthusiasm. From Atlantic City men go back to perform the tasks of the world better and more happily. Along its shore the sun shines brighter, the air is purer and more invigorating. Atlantic City, like the electric lamp, lightens men's tasks, brightens men's lives, makes men's services more efficient and more useful.

The time coincides with the convention of the association of the electric light and power industry, from which men go out with new inspiration, carrying the benefits of electric light and electric service over expanding areas to more and more people with greater advantages and at more economical cost.

The aeroplane, high in the sky, is lost in the darkness. Its siren wails in distress. Instantly, without intervention of human hands or direction by human mind, the electric lamps interpret the call and respond to the need with a flood of light to point the way. The spectacle of the lights begins and their radiance will make the Heavens declare the glory of God and the firmament show His handiwork.

Light's Golden Jubilee Arouses the Nation's Interest



HENRY FORD BORROWS TWO CENTS

Henry Ford had to borrow two cents when he bought the Thomas A. Edison commemorative stamp at a special post office set up at the Atlantic City Auditorium June 6th. Behind the counter, flanked on either side with pictures of Edison, was Postmaster Perkins. As he handed to Mr. Ford the first stamp to be sold here, the motor magnate searched in vain through his pockets for two cents. J. F. Quinlan, Executive Secretary of Light's Golden Jubilee, came to the rescue with the necessary coppers. "Thanks," said Mr. Ford, taking the change. "I'll see that you get it back."

In the photograph, taken at the special postoffice in the Convention Hall, are, to the right, Mr. Ford, M. L. Eidners, Superintendent of Division of Stamps; J. F. Quinlan, Executive Secretary, Light's Golden Jubilee; M. S. Sloan, New York Edison Co., and G. C. Osborn, General Sales Manager, Edison Lamp Works.

THE opening celebration of Light's Golden Jubilee was so happily mingled and blended with the whole of the N. E. L. A. Convention it would be both impossible and undesirable to draw a line of demarcation.

Although one day was set aside as Edison Day, when special homage was paid to the Father of the Industry by speakers and audience, the tributes to Mr. Edison ran, as it was said, like a theme in a musical composition throughout the whole convention.

Without question, the Edison Pioneers, the sponsors of Light's Golden Jubilee, have the whole-hearted support of the electrical industry and, moreover, the entire country appears to be eager to participate in the Jubilee, which reaches its grand climax on Oct. 21, the anniversary of the perfection of the first practical incandescent lamp. In the meantime, the U. S. Government has set its mark of approbation on the Jubilee by issuing special postage stamps bearing an engraving of the original lamp. Niagara Falls is having, this month, a festival of light which is expected to attract 100,000 visitors, and from now until the 21st of October practically every city, town and hamlet will in some fitting way pay public honor to the great inventor.

The Plan Book for Light's Golden Jubilee has been prepared and will shortly be distributed by this Association to member companies. The Plan Book will give detailed suggestions for the holding of local celebrations, from the handling of the preliminary publicity to the completion of the celebration.

The placing on sale June 5 of the commemorative stamps at Menlo Park, N. J., which village has the distinction of being the birthplace of the original Edison lamp, drew thousands of persons from all over the United States eager to purchase the stamps in the town where Edison labored for so many years on his marvelous inventions.

The stamps were put on sale as soon as Postmaster Shepherd opened the doors, where a line had begun forming before 7 o'clock. There were stamp collectors from near and far—one from Arizona in a ten-gallon hat, another from California. Some 400,000 stamps were sold during the day—from a post office that ordinarily sells about thirty. In the first fifteen minutes stamp collectors had ordered more than 250,000.

The first stamp of the issue of 180,000,000 was placed on a letter from Postmaster General Walter F. Brown to J. F. Quinlan, Executive Secretary of Light's Golden Jubilee. The letter to Mr. Quinlan read:

"My Dear Mr. Quinlan:

"This letter is posted at Menlo Park on the first day of sale of the Edison Commemorative Stamp. The stamp on the envelope is the first one issued to the public.

"In this connection I take pleasure in commenting on the patience and industry which you have shown in the worthwhile task of commemorating Mr. Edison's notable achievement."

The first piece of mail that went out was a specially bound blue morocco album, lined with blue silk and bearing the first impression of the Edison stamp. It was sent by air mail to Mr. Edison at Fort Myers, Fla., with this inscription:

"This, the first impression of a special postage stamp issued by the Post Office Department of the United States of America in commemoration of the fiftieth anniversary of the perfection of the incandescent lamp by Thomas A. Edison, is presented to him in evidence of the department's appreciation of his contribution to the welfare of mankind."

The stamps were placed on sale at a special post office in front of the Convention Hall at Atlantic City on June 6, and many thousand were purchased by the convention delegates and the townspeople.

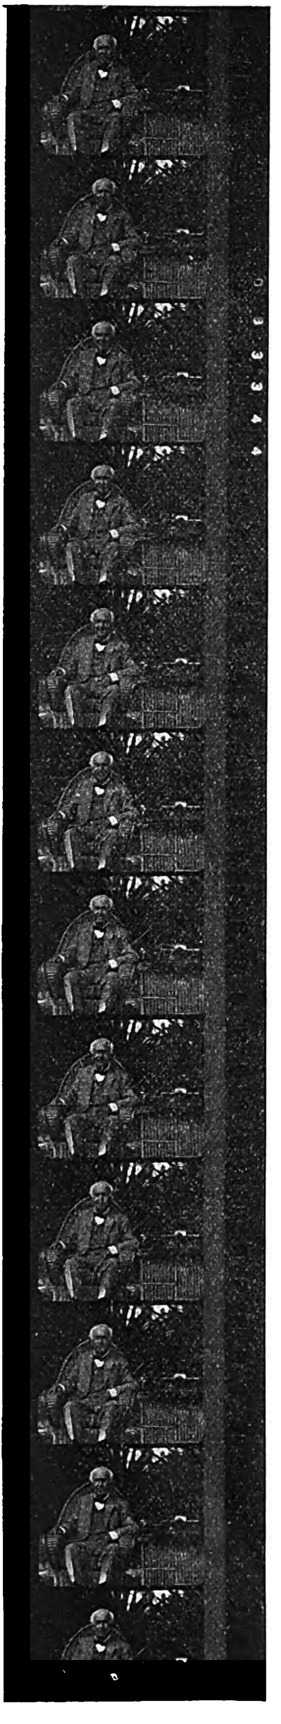
Among the many interesting things to be brought out in connection with the Jubilee are replicas of the original lamp.

Thousands of these approximate replicas of the great inventor's pioneer lamp are now being manufactured by the leading lamp makers of the country for distribution to electrical dealers, central stations, electric leagues and others throughout the land.

This lamp, though quaint, will burn, and is to be used as part of countless window and counter displays calling the world's attention to the fact that this is the fiftieth anniversary of Edison's history-making discovery, and that Light's Golden Jubilee, celebrating the occasion, is everybody's opportunity to participate in a world-wide expression of gratitude to the greatest inventor of all time.

It is expected that this facsimile, so unlike the modern inside-frosted lamp of today, will arouse no end of curiosity in the public mind.

Movietone to Carry Convention to All Parts of the Country



FOR the first time in the history of conventions an annual get-together meeting of a great national industry has been recorded in the form of a talking motion picture film. The film is now being wrapped up, put into cans, and shortly will be ready to ship around the country in order that those who could not get there may see and hear the 52nd Convention of the National Electric Light Association.

It was a big idea, and the interesting feature about it is that it has never been done before. It all started with a private showing of movie talking films of such men as Sir Ernest Benn, the noted English economist; Dr. Alberto Pirelli, President of the International Chamber of Commerce; Sir Kengo Mori, Chairman of the Japanese Delegation to the Reparations Conference, and last, but to the light and power industry most important of all, Thomas A. Edison. It was impossible for these men to be present at the convention, so they sent their greetings and their thoughts as to the future by means of a movietone taken at their homes.

Someone suggested that if persons of importance could be brought to the convention in this manner the convention itself could be taken about the country in exactly the same way to those who were not so fortunate as to be able to attend it. No sooner said than done. Arrangements were immediately made with the Fox Case Corporation to move a crew and the necessary equipment to Atlantic City. From the time Preston S. Arkwright, President of the National Electric Light Association, stepped out on the balcony of the Auditorium on the evening of May 31st to inaugurate Light's Golden Jubilee, until the election of Matthew S. Sloan as President for the coming year, every important event was "shot" by the camera and sound men.

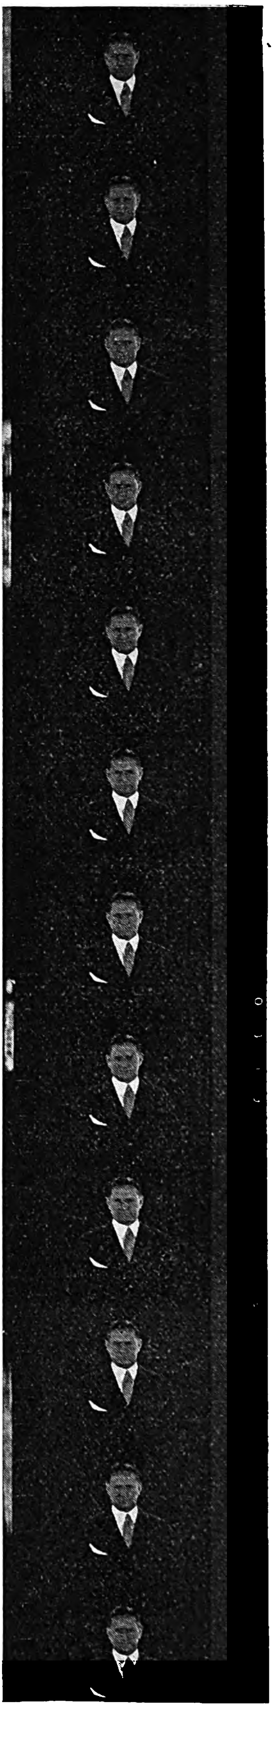
Included in this film will be not only pictures of the convention itself, but close-ups of leaders of the industry delivering their speeches, pictures of the exhibits accompanied by band music, pictures of extra-convention events, and the talking-movies of the various personages who addressed the convention through this medium.

At an early date this film, or any portion of it, will be available for conventions of Geographic Divisions, various section and committee meetings, gatherings of employees' associations—in fact, for any sort of affair attended by those interested in seeing and hearing the greatest convention ever held by the N. E. L. A. It has already been booked for a number of such showings.

Perhaps the most interesting section of the whole film is that which shows Mr. Edison at his summer home in Florida. He is seated comfortably in a great arm chair and talks to the audience as though it were seated around him. He discusses briefly his early visions and struggles, compliments the light and power industry on the progress it has made and expresses his pride in the fact that he was able to play a part in the development of electricity.

Paul S. Clapp, managing director of the N. E. L. A., in a convention address, said:

"The introduction of the talking-moving picture has provided us with a new instrument rich in possibilities. We are undertaking something this year which has never been tried by any national convention. We are making a talking-movie film of the whole convention and exhibit. A staff of expert talking moving picture operators is here under the direction of a leading moving picture director. This film will be finished next week. Within ten days after the close of the Convention it will be shown at Breezy Point, Minn. (North Central Division Convention), then in succession at Del Monte, Cal. (Pacific Coast Division Convention), and Seattle, Wash. (Northwest Division Convention.) Thus we hope to translate to the thousands back home something of the inspiration and benefits of this great Convention which you are privileged personally to enjoy.



Considering Certain Obligations

By AMPLIFIER

DURING the past year, certain portions of the daily press and an occasional periodical have been printing articles purporting to tell how the electric light and power industry have been seriously engaged in "poisoning the wells of education," subsidizing colleges and universities, seducing professors and others charged with the training of the young, censoring text books in use in the public schools and injecting into curriculæ everywhere highly improper material designed to influence both teacher and pupil with regard to the advantages of private initiative over government ownership and operation.

It is quite true—and there seems to be no occasion to deny it—that the industry has taken a great interest in all sorts of educational institutions and in the things which are being taught in them. It has its national committee on cooperation with these institutions and has contributed to some of them various sums of money; when solicited by them, rather than on its own initiative. It has, from time to time, engaged college professors, presumably authorities in their respective lines, to do certain work for it. It has examined text books for the purpose of finding out just what the authors were teaching with regard to the industry itself. It has distributed, in large numbers, pamphlets setting forth the romantic history and astonishing development of the industry.

ALL of this is a matter of public record, and there has never been any secret about it. Under the circumstances which have surrounded the procedure it would have been impossible otherwise. It would therefore seem that it only remains to find out why the industry has done these things; whether or not there are two sides to the picture or the story. Certainly they were not done without reason and it may very well be that there was nothing sinister about that reason.

I have dealt with the question of the so-called "school pamphlets," or extra-curriculæ material, in a previous article. In this I attempted to draw the line between proper and improper material intended for use in schools. In my opinion such material, to be proper, must fit in with modern educational tendencies; must avoid any discussion of a particular political creed, social philosophy, or industrial policy; must be confined to statements of fact and avoid opinions and editorials; and, above all, must fill some specific need. Material of any other sort is improper. The existence of any or all of the qualifications can be easily determined by an examination of the material itself, with the possible exception of the actual need for it. It is this in which I am most interested at the moment.

IN connection with any consideration of the need for the sort of material which is being constantly distributed by the National Electric Light Association as the representative organization of the industry there also arises the question of obligation. What does a great national industry owe to the American public—which buys its product—in the way of detailed and accurate information as to its business, its history, its services and its manner of operation? Should it respond to requests for this information or should it sit back with an attitude of "it's none of your business," thereby saving itself a lot of time, trouble and expense? To answer such a question it is necessary to first find out if there is any such demand insofar as the light and power industry is concerned.

With something of this sort in mind I obtained permission to examine some of the files of the National Electric Light Association, the same files which were willingly thrown open to the microscopic search of investigators of the Federal Trade Commission, I found a great mass of letters from public school teachers and officials, college instructors and professors, librarians and other folks connected with educational work. Because of the general tenor of these letters it is my purpose to quote some of them, deleting the names of the institutions and the writers, but assuring the readers of this article that they are actually in the possession of the Association.

The first one that comes to my attention is from an assistant professor in economics of a large university located somewhere in the State of Pennsylvania. He says: "One of the officers in the General Electric Company sent me a copy of 'The Romance of Power.' I enjoyed it so much that I am writing for twenty copies for a class in beginning economics which I now teach in the .... Branch of the University of .... The course is for enigneering students; a group that should be very much interested in the contents of this pamphlet. If copies are immediately available I will assign the material as outside reading and give all or a part of one class-room period to a discussion of its contents."

Now, "The Romance of Power" cost a lot of money to produce. How should the National Electric Light Association reply to this letter? Should it say "we are not interested in your engineering students," or "we will send the copies you request on receipt of your check for so many dollars," or should it contribute this obviously desired material as a part of its obligation to American education? It seems a simple enough question to answer, yet there are those who would say that such a contribution constitutes a questionable attempt to inject propaganda into this university.

HERE is another from a well-known college for teachers. It reads: "I am certainly indebted to you for your kindness in sending me the four pamphlets, six copies of each. They are certainly excellent material for chemistry and physics classes. They are so good that I am making bold to ask for some additional copies of those on electricity, electric railways and the telephone—enough if possible to place one in the hands of each student to use as a supplementary text, to be returned when the unit is completed."

This letter, which is signed by a professor in the Science Department, refers to the same school pamphlets which have had such large distribution in public schools throughout the United States. If they are as black as some of the enemies of the light and power industry have painted them it would seem that this professor is sadly out of place and should be summarily dismissed.

A letter from the Librarian of the Engineer School Library, Army War College, War Department, is interesting. I give the name of the institution here because it belongs to the people of the United States and its records are public property. He says: "In response to your favor of the 7th inst., we shall be very grateful to you if you will keep our Library on your mailing list, so that we may receive your Proceedings as issued. Your publications are greatly appreciated and constantly used by our instructors and student-officers in their research work."

The "Proceedings" is among the most expensive publications issued by the National Electric Light Association. It constitutes a complete record of the history of the industry for the current year. Shall the Association say that it has no interest in the instructors and student-officers of the Army War College? Shall it demand that the Treasurer of the United States function before material requested is sent? Or shall it keep this particular library on its mailing list?

But the War Department is not the only branch of the United States Government which has been guilty of approving of the material sent out by the National Electric Light Association. We find the Librarian of the United States Naval Academy in the same category as the Librarian at the Army War College. He says: "Replying to your circular letter of the 7th, let me ask that you keep the library on your mailing list. Your publications are very welcome and suitable here, and please accept for the Association the Library's gratefulness for those you have sent previously."

Returning to educational institutions, we find a letter from the Professor of Electrical Engineering, College of Technology, of a New England State University. He says: "You will be interested to learn that we are using the Proceedings now on hand in connection with term papers which are required of our Senior students in Electrical Engineering. We find the information given in these Proceedings very valuable, and wish to continue to receive them by all means." This is indeed serious. The material sent out by the N. E. L. A. is actually a part of the *required* work to be done by these students about to find their places in the outside world.

THE professor of electrical engineering in a Southern polytechnic institute makes an inquiry. After saying that he regards the Proceedings "as of great value as books of reference," he continues: "I understand that N. E. L. A. has published a bulletin on the subject of corrosion and pitting of the runners of hydraulic turbines. Just now we are very much interested in this subject and are undertaking some experimental work to clear up, if possible, the cause of this phenomenon in the runners of the turbines of one of the utility companies in the State. I would appreciate it very much if you would have any literature which you may have available covering this subject sent to me."

Here we have an educational institution actually attempting to solve a problem for one of the light and power companies and asking the help of the industry in solving that problem. What is the obligation of the N. E. L. A. in this instance? It has a vast store of data on all sorts of engineering subjects, the result of much research and expenditure of money. Shall it make it available or shall it keep it stored in its files and on its shelves, refusing to help an institution that is trying to help a company which may or may not be one of its own members?

I could go on indefinitely quoting from such letters as these until I had written more than one book. A Middle Western university writes: "We find the contents of this volume exceedingly valuable in our teaching and reference work." From a university up in Canada comes: "These proceedings are of great value both to the teaching staff and to the students of our engineering courses and I desire to express on behalf of the engineering faculty our appreciation of *the public service rendered by the N. E. L. A.* in sending us these publications for our library." It is signed by the Dean of the Faculty of Engineering and Architecture; the italics are mine. Down in Virginia the educators "always find your publications of great value and interest as reference works and by all means we shall desire to continue to receive this material as long as it is being distributed." Up in New York State a great university asks that all material be sent to a certain professor "who desires to have these valuable volumes housed where they will be permanently available and cared for."

OUT on the Pacific Coast the director of a large public library expresses the opinion that "your Reports and Proceedings are of great value to this library." From Indiana comes the statement that "I cannot imagine that a time will ever come when we would not want to have your publications on file." An institution in New Brunswick hastens "to write you to say that our department of physics and electricity finds these reports exceptionally valuable and makes constant use of them." Out in Utah the Proceedings are "of great value both in connection with class work and for general reference." Oklahoma wishes "to thank you for this wonderful collection of interesting and instructive information."

As I say, I could go on multiplying these quotations indefinitely. The general tenor is always the same. The material sent is of the greatest value in educational work; please "keep us on your mailing list." The only question is: "Has the industry any obligation to continue this sort of cooperation?" It is for its critics and the educational institutions themselves to answer.

With regard to financial contributions to colleges and universities there seems to be a very obvious reason for them. The light and power industry is constantly in search of men, and particularly of men who are college graduates, for all sorts of positions. Its constant complaint is of the difficulty in securing in sufficient number the right sort of men with the right sort of education. But, says our college or university, "we have hardly enough money for the work we have already undertaken. We would like to install courses in public service operation and management and will gladly do so if you will furnish the money until we can make such a department self supporting." Why not? Why shouldn't the industry which is going to employ the graduates from these courses assist in financing them? Many industries and individual industrial leaders have endowed chairs in this or that subject in one or more educational institutions. What possible objection can there be to similar endowments by the light and power industry when it means a supply of the kind of man power it needs?

Furthermore, hasn't it a very distinct obligation to do so? It seems to me that every great public service, dependent as they are all are on the public for support, should devote a little of its earnings to American education, even though there may be some little selfishness in the motive; in this instance the need for university trained men. And it must not be forgotten that this financial aid has been *solicited*.

IT is true that the light and power industry has employed college professors to do specific things for it and probably has received good value for its money. But these things have had nothing to do with the attitude of this or that professor toward the industry or private ownership and operation vs. government ownership and operation. In one outstanding instance the professor was employed to make a survey of courses in public utility management and operation in various colleges and universities, and to report his observations as to how the industry might best cooperate with these institutions in installing such courses. Here, again, we find the motivating force is the need for universty trained men, as well as the moral obligation to be as helpful as possible to those institutions wishing to install departments of this kind.

As to the examination of text-books, I may say that I have delved into a hundred or more of them and have found many, many instances where the text, insofar as the public services are concerned, is obsolete, inaccurate, provincial and in some few instances downright socialistic. Every citizen, every parent-teacher organization, every trade association or Chamber of Commerce, and every industry has a right to inquire as to what children are being taught in the

Behind the Veil

An Artist, a Queen, and a Court Physician

By ERNEST GREENWOOD

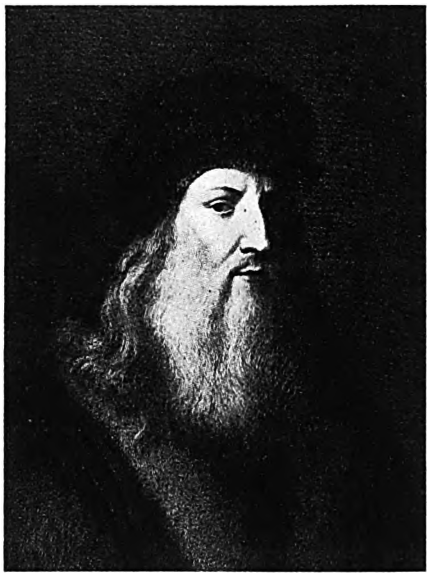
The third of a series of articles under the general title of "Behind the Veil" which will portray against a social-historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth

IN his fascinating book "From Myth to Reason," Woodbridge Riley describes the progress of man's mind as a "drama in five acts." The first act is the Age of Myth, "when men believed that nature was ruled by rival gods, with the world as their playground." While toward the end of this act an attempt is made to reduce these gods to forces of nature, the same motive carries over into the second act which may be called the Age of Magic. Men had a terror of the forces of nature and filled the world with monsters. This state of mind obtained during the Dark Ages and lasted until toward the end of the Middle Ages when it was discovered that "the ocean was not filled with grotesque beasts and that strange and terrible men did not inhabit the remote parts of the earth."

In the third act comes the "rebirth of knowledge" when the scientific discoveries of the ancient Greeks were revived and the workings of the universe were reduced to natural forces. This act may be limited roughly to what has been mistakenly called the "Renaissance," although, as I stated in the preceding article, "history cannot be fenced off by specific dates." Furthermore, we cannot say that during this period there was a "rebirth" in the sense of a sudden beginning. As Parsons tells us, "it was preceded by the great and pulsing era that built the Gothic cathedrals, an age of youth and swift growth, clearly the product of the times. The Renaissance was equally an evolution from the centuries that immediately preceded it, save that it drew one additional source of inspiration across 2000 years of time."

THE fourth act might be called the Age of Mechanics when the world was looked upon as a machine. The fifth great act is the Age of Evolution, when the world is discovered to be alive; a living machine, which completes the drama.

The Middle Ages were declining by 1300. The fourteenth and the fifteenth centuries can be considered as a transition period to be classed either with what had gone before or with what followed, and containing elements of both. There was a movement which is usually called the "Revival of Learning," as John W. Lieb tells us, "with its new conceptions of philosophy and religion; its dedication to new types in the arts; its casting aside of astrology, alchemy and the black arts for the natural sciences; its manifold inventions and discoveries; and its changed political systems." Many important events quickened the stream of history or changed its course. Among there were: the Reformation and Counter-Reformation; the discovery of America; the triumph of Nationalism; the beginnings of modern science; and the three great inventions—the mariner's compass, gunpowder and paper and printing from movable type. At the same time the classical works of Greece and Rome in their influence on science, literature and the arts were rescued from oblivion. The Renaissance itself can be said to have had its beginnings in the latter half of the Fifteenth Century.



From a self portrait

LEONARDO DA VINCI

The outstanding figure of this period—perhaps the most unique figure in history—was Leonardo da Vinci (1452-1519). Mr. Lieb, in his "Philosophy of Invention," tells us that "among the learned professions that of engineering is looked upon generally as a calling in which the notable and the characteristic qualities of the philosopher, of the poet, or of the artist are conspicuously absent. It is considered to be so utilitarian, if not indeed mechanistic, in its aims and accomplishments, with such pressure for immediate achievement that little time remains for dedication to the finer things of life, such as cultivation of the fine arts or pursuit of belles lettres." Mr. Lieb himself, who is senior vice-president of the New York Edison Company and whose reputation as an engineer is international, shows, by his own writings, how fallacious such a conception may be.

AND so it is interesting to note that Leonardo da Vinci, whom most persons think of only as the great painter who produced "The Last Supper" at Milan and the "Mona Lisa" of the Louvre, turned his attention, in part at least, from art to science, engineering and inventions during the end of the fifteenth and the beginning of the sixteenth centuries. He may easily be regarded as the first engineer of modern times and his name enters into the history of countless scientific topics from capillary attraction to flying machines. He has been called "the world's most universal genius" and "the most complete man of all times." He was "artist and scientist, as well as an engineer of ability, musician, poet and philosopher. Strong, handsome, and kind—he could break a horse-shoe with his hands and would buy caged birds to set them free." He gave the first correct explanation of the partial illumination of the darker part of the moon's disc by reflection from the earth and called mechanics "the paradise of the mathematical sciences, because through it one first gains the fruit of these sciences." He denied the possibility of perpetual motion saying, "force is the cause of motion and motion the cause of force."

Leonardo was a keen searcher after the cause and reasons for the things he saw about him, and his greatest delight was in discovering the fundamental laws underlying natural and physical phenomena. He was continuously endeavoring to express the facts and manifestations of nature in terms of what he called a "regola"—a general rule of law. His notes are full of such expressions as these: Try this; observe that; note the effects of this; go tomorrow and ask Maestro Antonio how mortars are placed on bastions by day or by night. He says "I remind you that you confirm your statements and your conclusions through examples and not assertions, which would be too easy. You should say: "Proven by experiment"! There is hardly a department of human knowledge which he did not touch upon and to which his notes do not make some pertinent reference.

IN concluding his address on "Leonardo da Vinci, Natural Philosopher and Engineer," given before the Franklin Institute, Jan. 19, 1921, Mr. Lieb said: "It has not been possible in the necessarily condensed form of this address, to more than give a very general outline, a mere sketch, of the immense field or thought, of research and of constructive detail over which the activities of this extraordinary genius extended, involving, as it does, natural philosophy, physics, chemistry, mathematics, geometry, geology, botany, biology, anatomy and physiology, the plastic and graphic arts, civil, military, mechanical and hydraulic engineering, and last, but not least of all aviation." Speaking of Leonardo's work in the field of artificial flight Mr. Lieb says: "In no other direction has he shown such a combination of the extraordinary powers he possessed of scientific research, acute observation and mechanical ingenuity. Without the internal combustion motor we have today, aviation would be just about where he left it, with the possible exception of the work done on gliders by Chanute and Lilienthal."

The invention of paper and printing ranks in importance with the invention of the alphabet by the Egyptians. Paper antedated printing. Although the ancient world—the Egyptians, Greeks and Romans—used papyrus and the Middle Ages used parchment made from skins, the Chinese had made paper several centuries before the Christian era. In the eighth century A. D. several Chinese paper makers were captured by the Arabs who forced them to work at their trade. Eventually paper making was introduced into Spain by the Moors in the twelfth century becoming common in Europe by the fourteenth century. Gutenberg printed his first page from movable types at Mayence, in Germany, about 1450, to be followed by Caxton in London in 1474, the famous Aldine Press in Venice, 1494, and the Plantin House in Antwerp in 1549. By 1500, thousands of books had been printed. And yet, again, it has been claimed that the Chinese invented printing at a time when "gentlemen in Great Britain were beating one another over the head with spiked clubs."

What has printing to do with the foundations of modern science? In the preceding article the question was raised as to whether a great invention is summoned by necessity or whether it creates the era which it serves. Parsons argues that in the case of printing the need preceded the event. Yet in a previous statement he seems to argue against this very thing. The Greeks knew nothing of printing. They had only manuscripts copied painfully on rolls of papyrus. Yet "they wrote some of the greatest pieces of literature, they created a great architecture and sculpture, and they developed an extraordinary number of fine minds, some of them probably as great as any the world has ever seen. Plainly printing was not essential to genius or an intellectual aristocracy. The high achievements of the Middle Ages were equally without the benefit of printing. The flowering of religious faith and the great cathedrals it produced were not aided by printed books. Neither were the legal system and the empire of Rome. Literature, art, intellectual power, religious faith, organization—what was left for printing to foster?"

QUEEN ELIZABETH

From a painting in the Library of Oxford University

The answer is obvious — democracy of government and the mind, and science. The former would have been impossible and the latter long delayed without printing, providing, as it did, a vastly improved means of communication. Yet neither was the product of the Renaissance but rather of the eighteenth century. However, modern invention rests on modern science which in turn would have been indefinitely postponed without the swift interchange of ideas by means of print. Movable type has been fundamental to the cause of civilization but, in my opinion, has contributed largely to the creation of the era which it has served so faithfully rather than having been itself created by necessity.

The history of electricity is generally supposed to be largely confined to the last two centuries, yet if we consult books written by authors drawing their information from manuscripts written hundreds of years before the invention of printing, we find that Thales noted the phenomena 600 years before Christ. Certainly, the loadstone was known to antiquity as a stone having the power of attracting and carrying a load of iron—a principle to be found today in the great electro-magnets which will lift and transport tons of metal. However, it is when the student of history tries to uncover the earliest date on which its directive property was first recognized and used for guidance on land or sea that he becomes discouraged.

I HAVE said the mariner's compass was invented during the period of the fourteenth and fifteenth centuries. Technically speaking, this is like saying that Edison invented the principle of obtaining illumination by rendering a body incandescent with an electric current when, in 1879, he succeeded in devising a practical incandescent lamp and a practical system of distribution which would make it commercially available. The facts are that "incandescent lighting" can be traced back to at least 1820, and perhaps, if we had the patience, it could be traced back much further than this. In 1840 Sir William Robert Grove gave a lecture before the Royal Society and demonstrated his new battery "by lighting the auditorium with incandescent electric light." It remained for Edison to take the principle and invent the lamp which laid the foundation to the light and power industry as we know it today. This, however, is another story.

So it is with the mariner's compass and its directive properties. Turning back a few thousand years we can find this sort of record as set down in The Bibliographical History of Electricity and Magnetism, by Paul F. Mottelay: "It is related that, during this sixty-first year of the reign of Hoang-ti (2637 B. C.) the Emperor's troops, who were pursuing the rebellious Prince Tcheyeou (Tchi-yeou), lost their way, as well as the course of the wind, and likewise the sight of their enemy, during the heavy fogs prevailing in the plains of Tchou-lou. Seeing which, Hoang-ti constructed a chariot upon which stood erect a prominent female figure which indicated the four cardinal points, and which always turned to the south, whatever might be the direction taken by the chariot. Thus he succeeded in capturing the rebellious prince, who was put to death." Hoang-ti (Hoang, Supreme King) is said to have been third in the "Period of the Five Emperors" and regarded as the founder of the Chinese Empire. He is supposed to have died at the ripe old age of 121, after reigning 100 years. Some historians say that upon his chariot stood a needle, to denote the four parts of the world. This would indicate the use of a compass or something similar to it.

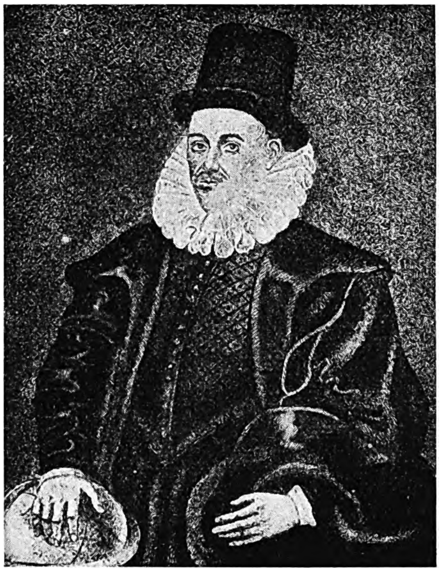
SKIPPING the next 1500 years we find that in 1110 B.C., Tcheou-Koung, Chinese Minister of State under both Von-Vang, first governor of the Tcheou dynasty, and Tsching-Vang, the second emperor) is said to have taught the use of the needle compass to the envoys from Youa-tchang. "As the ambassadors sent from Cochin China and Tonquin (Humboldt, 'Cosmos,' Vol. V, page 51) were about to take their departure, Tcheou-Koung gave them an instrument which, upon one side, always turned toward the north, and on the opposite side to the south, the better to direct them upon their homeward voyage. This instrument was called *tchi-nan* (chariot of the south), and it is still the name given to the compass, which leads to the belief that Tcheou-Koung invented the latter." In his chapter on "The Magnetic Needle," Humboldt says the apparatus was called *fse-nan* (indicator of the south).

Skipping another five or six hundred years to Homer, called the father of Greek poetry, we are told by Mottelay that he "relates that the loadstone was used by the Greeks to direct navigation at the time of the siege of Troy. The latter construction has been placed upon several passages in Homer, the most important being found in Book VIII of the "Odyssey"." As this appears to Mottelay to be "the first attributed allusion to the compass," he gives several interpretations from the original Greek. Among these are:

In won'drous ships, self-mov'd, instinct with mind;
No helm secures their course, no pilot guides;
Like man intelligent they plough the tides
* * * * * *
Though clouds and darkness veil the encumber'd sky,
Fearless through darkness and through clouds they fly.

ALEXANDER POPE,
The Odyssey of Homer, London, 1818.

The earliest reference to the mariner's compass in Christian Europe is said to be in a poem by Guyot, of Provence, dated 1190 A. D., while references to it are also made in works of the thirteenth century. One of these is interesting. It says: "No master mariner dares to use it lest he should be suspected a magician; nor would the sailors venture to go to sea under the command of a man using an instrument which so much appeared to be under the influence of the powers below." The "Age of Magic" was still with the world.



WILLIAM GILBERT

Engraved from a painting said to be the only one of Dr. Gilbert in existence

And lest we be inclined to sneer at the superstition of these times, it might be well to remember that belief in magic, and more particularly belief in witchcraft, is still with us. Furthermore, it is by no means confined to such groups as were recently brought to trial in York, Pa., which was simply a demonstration of the superstition of a few weak-minded and ignorant countrymen involving a hangover from days when such beliefs were held by the wise and learned. "More startling and much more serious," we are told by Dr. Edwin Slosson, Director of Science Service, "is the recrudescence among educated moderns of such superstitions after they have become virtually extinct, except for backwater and submerged sections." His statement, which appeared recently in *Collier's,* is given in full to show how men's minds, even in these enlightened days of modern scientific thought, cling to the inherited beliefs of primitive man.

"Newspapers publishing clarion editorials for clearing out superstition by compulsory education run daily horoscopes in the same issue. Astrology was laughed at by the educated Greeks and Romans, but we see astrological birthday books on our newsstands, and one of the charges made against the governor of Oklahoma was that he signed bills according to the dictates of the zodiac.

"In the Pennsylvania trials no effort was made by the lawyers to prove the reality of witchcraft, but only a few years ago, in a similar French trial, the plaintiff in which had been beaten up by those who thought he had bewitched them, evidence was admitted in court to prove that it was possible to injure or kill persons at a distance in the good old-fashioned way of sticking pins into their wax images. In support of this, experiments by French psychologists were adduced and backed by photographic exhibits.

"A few years ago I took a trip in a motor boat with a colporteur who was distributing the literature of his denomination, mixed with secular periodicals to make it more palatable, among the sailors in New York harbor. His engine stalled on the way, and he could not find anything material the matter with it. But he explained to me that such accidents were not infrequent with him, for the 'malicious magnetism' of the enemy sects caused much trouble with his motor.

"TALKING once in a mid-west city on this topic, and being a bit carried away by the occasion I ventured on the rash prophecy that: 'The general atmosphere is becoming so foggy with superstition that I expect to see witches once more in America before I die.' I thought as I said it that I was giving myself a long life, but you can't go back and erase a word when you are on the platform. When the question was opened for discussion, a lady arose in the balcony and said she was a witch. She offered to prove it by telling me how old I was, but I declined on the ground that I knew that only too well and did not care to have other people know it.

"In the nineteenth century we were expected to outgrow fairy stories at the age of ten, but in the twentieth we are urged to believe in fairies, not merely by Peter Pan, but by Sir Conan Doyle, who publishes photographs of them.

"A conspicuous indication of the restoration to respectability of a belief in witchcraft is shown by its appearance in two prominent scientific and historical collections of the times. In The Outline of Science, edited by Prof. J. Arthur Thomson of Aberdeen, one of the sections is given over to Psychic Science, by the distinguished physicist, Sir Oliver Lodge. The book is intended to present accepted modern science to the unscientific reader, but there is no intimation that this chapter is not as substantially supported and as completely accredited as any other, and in the eleven works that Sir Oliver recommends for reading there is not one on the other side of the question.

"The other work I refer to is that imposing series, The History of Civilization, edited by C. K. Ogden of Cambridge University and Harry Elmer Barnes of Smith College. This will comprise some 200 volumes and purports 'to present in an accessible form the results of modern research and modern scholarship.' So it is surprising to find two learned volumes devoted to witchcraft by a believer in its reality. In the History of Witchcraft and Demonology, the author, Rev. Montague Summers, argues that magic divination, demoniac possession and witchcraft cannot be denied by anyone who accepts the truth of the Christian revelation. And in his Geography of Witchcraft he says: "That a coven of witches existed in Salem is proved beyond all question." So the Oxford divine and the York yokels meet on a common ground of credulity. There are cycles in beliefs, as in modes and manners. The flapper, with a cigarette in her mouth as she flies along the highway through the mountains in her auto, passes a log cabin where sits the crone smoking a corncob pipe. Yet between the two smokers were two generations of women who disdained the touch of tobacco. So, too, witchcraft is coming into fashion again after a lapse of 200 years."

SEDGEWICK and Tyler think it is probable "the compass was first made commonly useful to western Europe early in the fourteenth century by Flavio Gioja, a native of Amalfi, a small port near Naples in Italy, who first poised the needle on a pivot instead of a card floating on water." Parsons thinks it may have been developed either by the Italians or the Scandinavians from the thirteenth to the fifteenth centuries. Again, he claims that it is "a clear case of great human events waiting upon the invention of a tiny piece of apparatus, a bobbing needle in a box." Again, I say that the compass created an era of exploration and discovery rather than having been called into existence by the need for it. The discovery of America, for example, changed the whole history of the world, but the voyage of Columbus was not necessary to human existence, nor, in fact, to the development of culture.

Dr. William Gilbert (1540-1603) is generally accredited with being the founder of magnetic and electric science. He was a true scientific experimenter, and considering the time in which he lived must be regarded as a prodigy of originality. He showed conclusively that the behavior of the compass was due to the fact that the earth itself is a great magnet. For two thousand years—from the days of Thales—it had been supposed that amber alone would attract other bodies upon being rubbed; Gilbert found that many other bodies could be thus excited, such as glass, sulphur and resin. His experiments and reasoning were sound, and he devised a hypothesis of "electric effluvia" which was helpful to electric science for a long time.

DR. GILBERT was a physician at the Court of Queen Elizabeth, a difficult time and a difficult assignment for anyone given to scientific contemplation. Elizabeth's ancestral history was bad. Her father was King Henry the Eighth, who solved his domestic and political problems by the simple device of the axe and block. He had six wives, of whom two were beheaded (this method of disposition being somewhat simpler than divorce), one was divorced by methods quite as simple as those of Soviet Russia, one was sent home and two died. Her mother was Anne Boleyn, who persuaded Henry to "divorce" his first wife so that he might marry her, and who lost her head for no apparent reason other than being guilty of the crimes of being a lawful consort and of bearing a mere daughter—Elizabeth.

It was during the era of Elizabeth and Shakespeare that saw the eclipse of parliamentary and popular rights and the rise of absolutism in England, as in France. The Queen had been preceded by Edward VI, son of Henry by Jane Seymour, his third wife, and Mary (sometimes known as bloody Mary because of the execution of 300 Protestants during her drive to restore Roman Catholicism), daughter of Henry by his first wife. While some historians speak of Queen Elizabeth as an "able and patriotic ruler" and her reign as covering "one of the most glorious periods of English history," she does not present an altogether pleasant picture, and serving her must have been accompanied by a considerable distress of mind. Like the River Forth and a certain type of modern politician, she "pursued a wandering, uncertain path."

About the time Gilbert was serving as a court physician, Dr. Ruy Lopez, a Portuguese Jew who had been driven from his own country by the Inquisition, became physician-in-chief to the queen; the highest place in his profession. One of the greatest fears of sovereigns in those days was the fear of being poisoned. Due to the efforts of the Earl of Essex, a great court favorite, Lopez was accused of conspiring to poison the queen and convicted, although apparently on evidence which was manufactured. He was hung and, after the quaint custom of the day, cut down before he was dead and horribly mutilated while still alive. Essex himself eventually lost his head when the queen grew tired of him; she had a habit of disposing of favorites in the same naive manner as her father disposed of wives—with the axe.

And so life at court as a servant of this temperamental lady who held in her hand the absolute power of life and death could not have been conducive to quiet philosophical or scientific study. In spite of this, however, history tells us that Gilbert's work "is one of the finest examples of inductive philosophy that has ever been presented to the world." His *De Magnete* stands as almost the only important contribution to our knowledge of electricity and magnetism until about 1730, although Von Guericke, following suggestions of Gilbert, made a rude electric machine which he described in a work published in 1672, and had observed the electric spark, which, with his machine, was so small as to be seen only in the dark and to be heard with difficulty.

"DE MAGNETE," which was published in 1600, represents more than 17 years of study and experiment and is dedicated by the author "alone to the true philosophers, ingenuous minds, who not only in books but in things themselves look for knowledge." It is sub-divided into six books which treat respectively of the loadstone, of magnetic movements, of direction, of variation, of declination, and of the great magnet, the earth of circular movement.

After giving an account of ancient and modern writings on the loadstone, and indicating exactly what it is, Book I concludes with the announcement that loadstone and iron ore are the same, that iron is obtained from both, like other metals from their ores, and that all magnetic properties exist, though weaker, both in smelted iron and in iron ore; furthermore, that the terrestrial globe is magnetic and is a loadstone; and that just as in our hands the loadstone possesses all the primary powers (forces) of the earth, so the earth, by reason of the same potencies, lies ever in the same direction throughout the universe.

Book II contains Gilbert's electrical work and is supposed to be the earliest work ever published on electricity. In it the author explains what he calls his *versorium*—a rotating needle electriscope—and gives the results of his many experimental observations together with the opinions of others relative to magnetic attraction. This chapter contains the first systematic study of amber, a list of electrics and recognition of a group of non-electrics. He reaches the conclusion that "all bodies are attracted by electrics, save those which are afire or flaming or extremely rarefied," and that "an ordinary piece of amber does not attract by heat, even when brought to the flaming point, but it attracts by friction, without which latter few bodies give out their true natural electric emanation and effluvium." He differentiates between magnetic and electrical attraction by saying that "the loadstone, though susceptible of very high polish, has not the electric attraction. The force does not come through the luster proceeding from the rubbed and polished electric." He ends the chapter with the explanation that all magnetic bodies come together by their joint forces (mutual strength); electric bodies attract the electric only, and the body attracted undergoes no modification through its own native force, but is drawn freely under impulsion in the ratio of its matter (composition). He says that the matter of the earth's globe is brought together and held together by itself electrically. The earth's globe is directed and revolves magnetically; it both coheres, and, to the end it may be solid, it is, in its interior fast joined.

The Reverend William Whewell in his "History of the Inductive Sciences," says that in the *De Magnete* are contained "all the fundamental facts of the science, so fully examined, indeed, that even at this day, we have little to add to them." Dr. John Davy in his Memoirs of Sir Humphrey Davy says: "Gilbert's work is worthy of being studied, and I am surprised that an English edition (translation) of it has never been published." In 1893 nearly two hundred years after the publication of *De Magnete* in Latin, John Wiley and Sons published an English translation by Paul Fleury Mottelay.

No comment on this work of Gilbert's work would be complete without some note of the reproach thrown upon it by Sir Francis Bacon who also was a servant of Queen Elizabeth. In his *De Augmentis Scientarium* he observes: "Gilbert has attempted to raise a general system upon the magnet, endeavoring to build a ship out of materials not sufficient to make the rowing pins of a boat." But Bacon, although spoken of by many as the "greatest of English philosophers and philosophical writers," was a product of the political atmosphere which surrounded the Elizabethan court. Like the Queen herself, or like the Earl of Essex, or like so many others with whom she surrounded herself, he does not present a pleasant picture. Like some successful "Statesmen" of our own day he was a complete hypocrite and his tremendous intellectual attainments cannot sufficiently excuse his sneering allusions to the work of others quite his equal in mental development. It would be much like sneering at Mr. Edison because the Mazda lamp of today is such an improvement over the carbon lamp of 1879.

I HAVE said that Gilbert's work stands as almost the only important contribution to our knowledge of electricity and magnetism until about 1730, although Von Guericke, who followed his suggestions, published a work in 1672. In 1660 (some historians have placed the date as 1650 but the later date is probably correct) Otto von Guericke, a burgomaster of Magdeburg, Prussian Saxony, constructed the first frictional electric machine. It consisted of a globe of sulphur, cast in a glass sphere, and mounted upon a revolving axis. When rubbed by a cloth pressed against it by hand, it emitted both sound and light. It has been said that it was Guericke who "heard the first sound and saw the first light in artificially excited electricity." By placing a linen thread in contact with this globe he made the important discovery that, just as Gilbert found that magnetism passes from one end of an iron rod to the other, the electric attraction appeared at the distant end of the thread. Thus was established the principle that electric attraction could be "conducted" and made evident at a point distant from its source. In this primitive laboratory at Magdeburg, therefore, the "electrical transmission of energy" is supposed to have been born.

There is always something dramatic about comparisons. The chariot of ancient times with the automobile of today; the stage coach with the Twentieth Century Limited; the Indian canoe with the Leviathan; the balloon in which Montgolfier made an ascent in 1783 with the Graf Zeppelin; the first telegraph line, which ran from Baltimore to Washington, with the radio; Trevithick's locomotive of 1804 and the great electric giants of today pulling undreamed of loads with ease. But there is scarcely a historical comparison more dramatic than this bit of thread in Guericke's laboratory with a great 200,000 volt transmission line, built high in the air, and carrying enough electrical energy to light hundreds of thousands of homes, turn the wheels of innumerable factories, operate thousands of miles of electric railroads and street railways, and furnish power for almost every conceivable kind of activity. The principle discovered by Guericke is at the very foundation of our present day social, economic and industrial standards.

Public Relations National Section Session

(*Continued from page* 332)

lem, he asserted, they certainly can accomplish much.

At this meeting, B. C. Forbes announced that, for thorough and enterprising work in public relations, conspicuous energy in the development of rural business, successful load building in the face of municipal competition, harmonious architecture in plants and substations, effective use of radio broadcasting, friendly service to its customer and businesslike administration, the Forbes public service cup for 1929 had been awarded to the Puget Sound Power & Light Company.

An interesting feature was an address on "The Part Electricity Can Play in Better Home Management" by Miss Lita Bane, past president of the American Home Economic Association. She said that while there may be a limited demand for specialties of some kinds, women seem to agree that they would like to see the major efforts of electric service in the home directed to devising power machinery to take care of the time-consuming, heavy, frequently recurring, likely-to-be-monotonous tasks. It seems probable, also, that the home may regain some of its former prestige as a center of recreation for the family and small groups of friends. Electricity is making a direct contribution to this situation through the radio and electrically operated musical instruments and, indirectly, by making the house more comfortable and convenient for the entertainment of guests. It will undoubtedly make even larger contributions in the future.

Some of Miss Bane's suggestions to the industry were:

1. To produce and sell electrical service as cheaply as possible.
2. To study carefully the needs of home managers in order that money and effort may not be wasted in producing useless tools.
3. To produce electrically driven machinery which shall be as simple and as cheap as it is possible to make it.
4. To offer women careful training in the use, care and simple repair of household equipment. It is suggested that women are particularly successful in this work of helping to overcome their sex's prejudice regarding "machinery."
5. That care be exercised in putting into a home only suitable and needed equipment which its budget can carry without undue worry and strain.
6. One special need emphasized was the need of the farm home where in many instances an undue, almost an unfair, amount of manual work has still to be done by the housewife.

Nation-wide Food Preservation Campaign to Be Promoted by N.E.L.A. with Other Associations Cooperating

TEACHING the millions that 50 degrees is the danger line on the thermometer for the proper preservation of perishable food is the object of a nationwide program now being rapidly organized by the National Electric Light Associaion in cooperation with a score or more of other national trade associations and the public utility companies of the country.

The Commercial National Section of the N. E. L. A., at the suggestion of the Refrigeration Committee, has taken this as its principal promotional activity next fall. The movement will be known as the National Food Preservation Program. It will be centered, so far as public attention is concerned, in the month of September, although preliminary work will be going on actively throughout the summer.

The fundamental purpose of the whole program will be to impress on the American public these four major ideas:

1. The relationship between food spoilage and health.
2. To establish in the public mind a perishable food temperature of 50 degrees or less.
3. The cause of food decay and bacteria growth.
4. The vital need for proper all-year refrigeration.

Every avenue of advertising and promotion, national and local, will be employed to focus public attention on the benefits to health and the economy of proper refrigeration all the year round. Dominant advertising in national magazines will be the primary instrument. Newspaper advertising and radio broadcasting will add to the effect of the magazines. Magazine and newspaper articles by recognized authorities on the necessity for proper care of food to preserve health have been arranged. Addresses before community gatherings and complete local tie-up with the program by all the factors interested in public health and in the merchandising of refrigeration and of perishable foods have been planned.

The month of September was selected for the program for two principal reasons:

First, because it offers an opportunity to emphasize to the American public the need for proper refrigeration all the year.

Second, because it will stimulate sales at a time when there has been a tendency to relax selling effort.

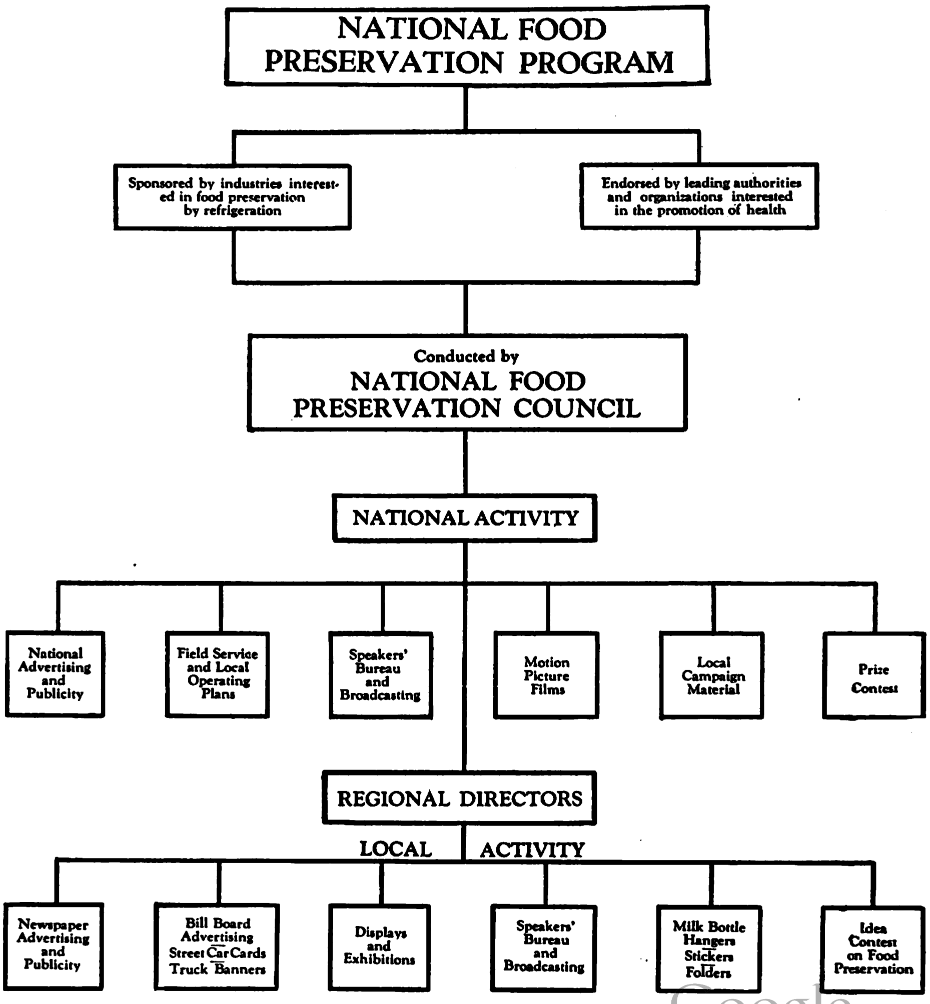
It has been accepted by many merchandisers of automatic refrigeration in northern states that concentrated selling effort has been worth while only in the summer months. The program will point out that Weather Bureau records show that 50 degrees, the danger line in food preservation, is maintained in outdoor temperature only nineteen days a year, as a national average.

Personnel of the Activity

The governing body of the program will be the National Food Preservation Council. Matthew S. Sloan, president of the New York Edison Company and president-elect of the N. E. L. A., is president of the council. J. E. Davidson, president of the Nebraska Power Company and former president of the N. E. L. A., is vice-president of the Council; P. S. Young, of the Public Service Electric & Gas Co., and treasurer of the N. E. L. A., is treasurer, and P. B. Zimmerman, sales manager, electric refrigeration department, General Electric Company, is secretary. The members of the Council are representatives of the interests and associations participating.

The program will be carried out by both national and local advertising and promotion—the national activity directly by the Council and its committees, the local activity by local councils which are being set up through a regional organization that will extend down into every community. For this purpose the entire country has been divided into twenty districts. A regional director is being selected by the Council for each district, who will be responsible for the organization of local councils throughout his district.

CHART OF ACTIVITIES



NATIONAL FOOD PRESERVATION PROGRAM
Sponsored by industries interested in food preservation by refrigeration
Endorsed by leading authorities and organizations interested in the promotion of health
Conducted by NATIONAL FOOD PRESERVATION COUNCIL
NATIONAL ACTIVITY
National Advertising and Publicity
Field Service and Local Operating Plans
Speakers' Bureau and Broadcasting
Motion Picture Films
Local Campaign Material
Prize Contest
REGIONAL DIRECTORS
LOCAL ACTIVITY
Newspaper Advertising and Publicity
Bill Board Advertising Street Car Cards Truck Banners
Displays and Exhibitions
Speakers' Bureau and Broadcasting
Milk Bottle Hangers Stickers Folders
Idea Contest on Food Preservation

The list of appointments of Regional Directors to date are as follows:

District 1
(Maine, New Hampshire, Vermont)
Roy Holden,
Cumberland County Power & Light Co.,
Portland, Me.
District 2
(Rhode Island, Massachusetts, Connecticut)
W. G. Keay,
Cambridge Electric Light Co.,
Cambridge, Mass.
District 3
(New York State)
M. E. Skinner,
New York Power & Light Co.,
Albany, N. Y.
District 4
(Metropolitan New York)
C. L. Harold,
Brooklyn Edison Company,
Brooklyn, N. Y.
District 5
(New Jersey and Delaware)
F. D. Pembleton,
Public Service Co. of New Jersey,
Newark, N. J.
District 6
(Pennsylvania)
George E. Whitwell,
Duquesne Light Company,
Pittsburgh, Pa.
District 7
(District of Columbia, Maryland, Virginia)
H. A. Brooks,
Potomac Electric Power Company,
Washington, D. C.
District 8
(Ohio. Kentucky, West Virginia)
C. L. Dunn,
Ohio Public Service Company,
Cleveland, Ohio.
District 9
(Indiana, Illinois, Michigan, Wisconsin)
E. L. Hinchcliff,
Middle West Utilities Co.,
72 West Adams Street,
Chicago, Ill.
District 10
(North Carolina, South Carolina, Georgia, Florida)
C. A. Collier,
Georgia Power Company,
Atlanta, Ga.
District 11
(Alabama and Tennessee)
A. B. Collins,
Alabama Power Co.,
Birmingham, Ala.
District 12
(Arkansas, Oklahoma, Mississippi)
R. I. Brown,
Arkansas Power & Light Company,
Little Rock, Ark.
District 13
(Louisiana and Texas)
P. E. McChesney,
Gulf States Utilities,
Beaumont, Tex.
District 14
(Iowa, Kansas, Missouri, Nebraska)
C. A. Nash,
United Light & Power Company,
Davenport, Iowa.
District 15
(Minnesota, North Dakota, South Dakota)
H. E. Young,
Northern States Power Company,
Minneapolis, Minn.
District 16
(Colorado, New Mexico, Wyoming)
G. B. Buck,
Public Service Company,
Denver, Colo.
District 17
(Utah and Idaho)
P. M. Parry,
Utah Power & Light Company,
Salt Lake City, Utah.
District 18
(Washington and Oregon)
A. C. McMicken,
Portland Railway & Light Company,
Portland, Ore.
District 19
(Northern California and Nevada)
R. T. Stephens,
Pacific Gas & Electric Company,
San Francisco, Cal.
District 20
(Southern California and Arizona)
H. G. Kenyon,
Southern California Edison Company,
Los Angeles, Cal.

The Council has engaged six traveling field specialists as organization experts. They will spend their entire time for the next three months assisting the regional directors in working out the organization and helping the local councils to prepare for full cooperation in the program.

The local councils will, in most cases, center around the electric leagues, where these exist, and will include all the electrical interests, gas companies, ice companies, milk companies, merchandisers of refrigeration and of perishable food, the medical societies, women's clubs, and other similar interests.

The Council is operating through two committees, executive and publicity. The executive committee as at present constituted consists of:

Marshall E. Sampsell, Chicago, Chairman of the Commercial Section, N. E. L. A., president, Central Illinois Public Service Company, *Chairman.*

C. E. Greenwood, New York, Commercial Director, N. E. L. A., *Vice-Chairman.*

P. S. Young, Newark, N. J., Treasurer of the N. E. L. A., treasurer of the Council, Public Service Electric & Gas Company.

J. E. Davidson, Omaha, president, Nebraska Power Company, and former president of the N. E. L. A.

E. G. Biechler, Dayton, president, Frigidaire Corporation.

George W. Mason, Detroit, president, Kelvinator Corporation.

Paul S. Clapp, New York, managing director, N. E. L. A.

C. L. Dunn, Cleveland, chairman, Refrigeration Committee, N. E. L. A., commercial manager, Ohio Public Service Company.

P. B. Zimmerman, Cleveland, general sales manager, electric refrigeration department of the General Electric Company.

E. S. Vail, Fond du Lac., Wis., president, National Refrigerator Manufacturers Association.

J. S. Tritle, Westinghouse Elec. & Mfg. Co., Pittsburgh, Pa.

The publicity committee consists of:

George F. Oxley, New York, director, Department of Public Information, N. E. L. A., *chairman.*

Earl L. Doty, Dayton, advertising manager, Frigidaire Corporation.

Walter J. Daily, Cleveland, manager sales promotion division, electric refrigeration department, General Electric Company.

Earl Lines, Detroit, advertising manager, Kelvinator Corporation.

Fred Millis, Indianapolis, president, Millis Advertising Company.

The plan for national activity includes, first, full color, single and double page advertisements in the September issues of national magazines, which in most cases will be distributed the last week in August. Articles by authorities whose names will carry weight with the American public on the benefits which the habit of proper food preservation will induce in the health of the nation have been arranged for national publications. Full editorial support of this program has been promised by a number of these publications, among them some of the principal women's magazines.

A speakers' bureau is another activity of the National Council. Arrangements have been made with health authorities, women who are widely known for their interests in developing better health habits among women and children, leading publicists, and representatives of all the interests concerned in this program to deliver addresses on the value of food preservation, and meetings will be arranged for them by the speakers' bureau.

Another division of the Council is preparing material, such as newspaper advertisements, newspaper publicity articles, window displays and truck cards for distribution to the local councils.

Lastly, a national idea contest on the subject, "Why 50 Degrees is the Danger Point," with a $10,000 model electrical home as the capital prize, and many smaller prizes, will be held.

This national program will be supplemented by similar programs of activity throughout the month in every community all over the country. Under the supervision of the regional directors, and with the active control in the hands of the local committees, there will be extensive newspaper advertising, mats or copy for which will be supplied by the publicity committee of the National Council, poster paper for billboards and cards for street-car advertising likewise will be provided. Suggested copy for newspaper articles, covering the formation and meetings of local councils, the purpose of the program, the essay contest and other activities in connection with the program will be supplied. National and local radio broadcasts, especially from stations controlled by power and light utilities, will be advocated, and suggested talks will be prepared. The entire energy of the women's committees which have done such effective work for many utilities will be directed along food preservation lines during that month. Plans for window displays have been worked out, and prizes will be offered for the best displays as shown by photographs. Local essay contests also will be promoted.

The Code Situation

Addresses made at the Chicago Conference of Company Code Representatives

THE BACKGROUND

By **Irwin W. Day**

Chairman Codes and Standards Committee, N. E. L. A.

Editor's Note: A conference of company code representatives—reported in the May N. E. L. A. Bulletin, Page 302—was held in Chicago on March 18 and 19, with the purpose of discussing the needs of the association in the code field.

The first session of the conference was devoted to addresses by prominent authorities. Mr. E. W. Lloyd, vice-president of the Commonwealth Edison Company, presided, and addresses were delivered by Judge O. B. Ryon, general counsel of the National Board of Fire Underwriters; Messrs. Sampsell and Stone, chairmen, respectively, of the Commercial and Engineering National Sections; Irvin W. Day, chairman of the Codes and Standards Committee, and Alva R. Small, vice-president of the Underwriters' Laboratories and chairman of the Electrical Committee, N. F. P. A.

The remaining sessions consisted of general discussion of the services which company code representatives are asked to render, the service which they may expect from the Association, and the best means for doing these things. The conference also discussed the various electrical codes, their characteristics and trends of development, desirable changes in their form and substance, and other matters intended to give the code representatives a general view of the situation and of their relation to it.

The addresses of Judge Ryon and Messrs. Day and Sampsell are herewith printed for the information of member companies. Other addresses made at the conference will appear in subsequent issues of the Bulletin.

In considering what features of the situation I would talk to you about at this meeting, I thought I could, perhaps, make it possible for you to better understand what this discussion of Codes and Standards is all about if I gave you something of the background leading up to the present time.

I want to go back to the time when the N. E. L. A. was not so well organized and equipped to carry on as it is today.

A good many years ago, when the idea of simplification and standardization was beginning to be accepted by industry generally, the N. E. L. A. tried to do a little something along this line for itself, and if my understanding of the matter is correct, it adopted a standard of some sort relating to some equipment. That standard seriously interfered with a certain manufacturer's product—practically ruled it out of the market. The manufacturer was prompt to bring action, and the N. E. L. A. as a result found itself in very much of a jam. The N. E. L. A. then went to the other extreme and decided to have no standards at all. Anything that was promulgated in the form of a standard was issued as a recommended practice. I believe we are supposed to be still operating under this plan at the present time.

In the course of time it became the custom to have N. E. L. A. representatives on the various standardizing and code-making bodies, and these representatives were invited in because of the interest which N. E. L. A. had in those matters. Sometimes such representative was appointed by the committee that was concerned in that particular thing; sometimes he was self-appointed, mainly because he was personally interested; sometimes he was appointed because the Association had been asked to appoint someone, and headquarters, casting around, finally found someone who could take the place. As a result, you will see, the appointments were rather haphazardly made. The lack of crystalized organization to handle these things was very much felt by the member companies. The main difficulty was that these appointees had no authority to speak for the industry as a whole. There was no routine established for obtaining a consensus from the member companies, nor for establishing Codes and Standards policies for the light and power industry. The day of joint committees to harmonize deadlocks that might occur between conflicting interests had not yet arrived, and finally the Association had entirely insufficient information to justify the stands that were taken by its representatives on these standardizing bodies.

There are many groups interested in this standardization and codification movement—the manufacturers' group, the insurance group, the telephone group, the railway group and the professional societies, such as the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, and many more.

Things got so bad finally that it was determined to establish at N. E. L. A. headquarters an engineering staff; but that did not seem to quite fill the bill; and finally a Director of Engineering was appointed. Little by little the work got organized and the N. E. L. A. began to function more efficiently in representing the views and requirements of our particular industry. Colonel William Kelly, then director of the N. E. L. A. Engineering Department, found that because of the far-reaching policies that were sometimes involved in these code matters it was necessary to have some central authority to whom he could go for guidance, and it was as a result of this that the National Executive Committee in 1926 appointed a special national committee called the "Codes and Standards Committee." It was a committee that was to be comprised of executives, not necessarily technical nor commercial, but men of broad vision and experience and able to determine policies for the Association that would not be derived from narrow technical or commercial viewpoint.

Fortunately for the Association, and for me as chairman of that committee, the members of the committee were very well chosen, and they entered upon the job of straightening out this situation with a sincere desire to cooperate and bring order out of the chaos that had existed. Mr. Marshall A. Sampsell, chairman of the Commercial National Section, who is a member of this committee, knows well the struggles we had during the first few months of the committee's existence, only two years ago.

The scope of the committee's activities was to determine policies for the Association, to prescribe principles and practices that the Association's representatives could follow, and to formulate procedure for the appointment of representatives on standardizing and code-making bodies. Soon after its organization, therefore, the committee adopted certain principles and practices and issued them in the form of a serial report in 1927. I think it would be very helpful if all of you code-making representatives were to obtain copies of this report from headquarters.

We had great difficulty in arousing the interest of the major executives. They seemed to think that this matter of Codes and Standards was highly technical, and they did not seem to recognize—at least, some of them did not—that it had a commercial side. Most of them gave it a wide berth—left it to the men down in the ranks to handle; and it was handled as a result in just the way you would expect. Things were getting rather serious; rather drastic changes were being suggested by the code-making bodies, and we finally did arouse the interest of the major executives. The appointment of company code representatives, who would handle code matters in their particular company and territory, resulted from the realization of the seriousness of the situation by these executives.

This gathering, as I understand it, is a gathering of these code representatives appointed by their respective companies.

There is quite a significant difference between Codes and Standards. Standards are more or less engineering definitions—guides as to how we can do things. Whereas Codes are in the nature of rules or laws. And because they are in the nature of laws they are apt to find themselves eventually, in one form or another, in the regulatory statutes. That is where our great interest lies. We are interested in knowing what finds its way into the statutes governing our business; and this is not a subject that can be lightly passed over.

There are many codes, but the two particular ones in which we are interested are what are known as the major electrical codes. They are very similar in name and are confused because of this similiarity.

The *National Electrical Code* is what is known as the "Fire Code," and is sponsored by the underwriters or insurance interests.

The *National Electrical Safety Code* is the "Casualty Code" and is sponsored by the United States Bureau of Standards.

Those are the two codes in which we have the greatest interest.

The National Electrical Code is the one that we are particularly interested in at this time, because of its requirements relating to wiring. The code has both a commercial as well as a technical side, and the chairmen of the Commercial and Engineering National Sections of the Association are here to tell you a little of those two sides of the question.

I hope you will be impressed with the importance of this code question when you leave here, and that you will pass on your impressions to your fellowmen, and particularly to your executives, because we must keep their interest aroused. The only trouble we are having right now is that we have aroused it so thoroughly they want to cure things in a minute, and they can't be cured so quickly. The codes have been years in building; I do not know that they will be years in reconstructing, but certainly it cannot be done in a minute. Nevertheless, the result of arousing the interest of the major executives has been the key to curing the situation, so far as the electric light and power industry is concerned. A series of conferences has been held with the manufacturers and with the insurance interests, all looking toward a real understanding of our mutual problems, and a common meeting ground has been established for the proper formulation of these code provisions which so seriously affect all of us.

I am glad to say that these meetings have been productive of most helpful and harmonious relationships. We understand each other a lot better than we did before. We don't look upon the other fellow quite so suspiciously. In fact, we feel that all fifty-two cards are now on the table, where we can see them and we feel sure that each card will take its proper place in the trick.

The situation is being clarified, and fortunately so, for the first time in a great many years the N. E. L. A. is on the road toward a safer and saner and more acceptable series of codes with which it has to deal in the conduct of its business.

THE FIRE UNDERWRITERS' PROBLEM

By O. B. RYON

Consulting Counsel, National Board of Fire Underwriters

THERE are some things we all know about electrical appliances and their use—some common interest shared by the utilities whose interests you promote, the fire insurance companies I represent and the public we both try to serve—while I cannot, for lack of technical training, put these matters of common interest into your terminology I may at least suggest some of them in the vernacular.

Possibly some of these frequent and familiar instances, involving electrical energy, may be related to the "National Electrical Code" and if so both you, the fire insurance companies and the public are concerned.

It is a pleasant, appetizing and cheerful experience to come into the dining room for breakfast and see a shining electric toaster or waffle iron ready and willing to function, but the joy of such an experience is worse than destroyed if, when the appliance gets into action, it is found defective either as to construction or installation and sets the house on fire.

It is mighty nice and convenient to push a button and strike a light or turn on the radio, but if crossed wires or some other defect smokes out the whole family it's not so good.

Your industry has put into our houses, electric washing machines, carpet sweepers, flat irons, water softeners, refrigerators and fifty other devices making household drudgery almost a thing of memory and we want more of them, and are willing to pay you for them and their use as fast as you can invent them, but we don't want to multiply the dangers to life and property by the same process—and neither do you.

The Stock fire insurance companies want to write all the fire insurance possible, including more of the utility companies than at present, but only under such conditions of safety as are required by sound underwriting.

We want you to supply electricity for all the bread toasters the people will buy, but we also want you to insist that these appliances shall conform to some established and recognized standard of safety, always having in mind that we insure the places containing this multitude of things electrically operated, and your carelessness or indifference may be our disaster.

I fancy this homely household illustration will give us at least a hint, of what was in the minds of the little group of fire insurance men who, nearly forty years ago, met in New York for the purpose of preparing, as best they could from the experience and data then available, a code regulating electrical installation.

There was not much to know—not much experience—because the business of generating and distributing electric energy was very much in its infancy, but from that beginning has come the long years of study, research and cooperative effort which makes the present "National Electrical Code" the recognized and final authority. I suppose it is a long way from perfect, otherwise you men would not occupy your time with such meetings as this, and I am very certain the sort of cooperation born of common interest is the incentive for bringing the fire insurance companies and Underwriters' Laboratories into your counsels.

The fire insurance industry has a great number of men, with all sorts of equipment and training along the lines of your work, who are always ready and willing to be of service and to cooperate with you when they can.

YOUR problems are ours in more than the ordinary sense because your mistakes are reflected in our loss ratios.

Fire insurance is immediately and vitally interested in what you do and how you do it purely as an underwriting matter, but we are also very much interested in some other problems which concern you and ourselves which have nothing immediately to do with producing or distributing electrical energy or selling fire insurance.

We have in the National Board of Fire Underwriters an activity known as the Committee upon Public Relations, the function of which is to try and carry to the insuring public the facts about our business, how it is done, how rates are made, why our requirements are necessary and reasonable, that we are not gamblers or highway robbers but conservative business people with a tremendous responsibility and a very large investment.

That the indemnity we furnish is the foundation of the industrial and commercial structure of the nation—that business cannot exist without us.

We have for many years been talking these things among ourselves and making a few speeches about them but now, through newspapers and other recognized advertising media and by regular advertising methods, we are getting to the public facts and data about our business, in the hope and belief that when they know us better they will like us better.

We are trying to take the facts about fire insurance out of the realm of speculation and platitude and put them into the province of reality and understanding.

There is a peculiarity about fire insurance not found in any other industry or commercial activity, with the possible exception of some other branches of insurance.

We sell indemnity—something not the subject of touch, smell or any other sense—something intangible—something which the commercial world must have in order to exist, but which differs so essentially from any other commercial relation that it requires more selling and explanation than most business transactions.

FIRE insurance is a negative proposition. When a man buys shoes or food or clothing, a home, a farm or a factory or even electric energy, he gets something concrete and tangible for his money.

When he buys fire insurance he pays for something which, if he is honest, he hopes will never happen, indeed if he has studied the "possibilities" he knows the chances are several hundred to one nothing will happen and so when his policy expires and has become waste paper there is, somewhere deep down in his inner consciousness, a misgiving about the necessity for the whole transaction and he must be more than ordinarily sound philosophically if he does not wonder whether after all he has not paid something for nothing.

This psychological condition—this attitude of mind—which is more general and persistent than might be thought possible, is one "Public Relation" we want to reach and correct because it is harmful and touches our business so immediately.

We have, however, broader, more comprehensive and much sounder reasons for the advertising campaign which is in progress and which I believe will continue, and the chief of these reasons is our desire to make such contribution as we can, to the thesis that all business and industry no matter of what nature or by whom conducted, if legitimate and necessary is, by the nature of our commercial structure, so related to every other business, commercial and industrial agency and our interests are so intermingled and inter-related, that one cannot prosper without the others.

The success of the Public Utilities depends upon the success of every other business including insurance and to some of us this is so obvious it hardly needs emphasizing—we know it so well that it seems idle to talk about it—old stuff of the stalest variety and yet it is a fact that, notwithstanding all the gospel of cooperation and inter-relation which has been preached, there is still a vast uncultivated field for this sort of endeavor.

The "Public" has heard but not heeded.

A few days ago I heard a speech upon the inter-relation and inter-dependence of business in which the speaker used this illustration—maybe the story is apochryphal—but no matter—it's a good story anyhow.

IT seems that after the World War when all Europe was devastated and production at a standstill the markets of South America were industriously cultivated by American manufacturers.

South America was prosperous and musical and among other industries in the United States which profited by this condition was the piano business and large orders for pianos were placed for consignment to the various South American Republics.

Then came the rehabilitation of Europe, the financial depression of 1922 and 1923 and word came that South America couldn't pay for any more pianos and the result was a small stampede of American piano makers.

The steel wire makers, veneer men, felt manufacturers passed out the word to suspend operation and there was prospect of serious trouble in the piano industry.

Just when this situation became most serious a genius out in Omaha invented and began marketing a confection known as "Eskimo Pie," made of ice cream and covered with chocolate.

The new sweet had immediate and wonderful popularity, demand was unprecedented in the history of this sort of thing and the first result was the solution of the piano makers' troubles over the South American market.

Chocolate, which covered these millions of bonbons, is a South American product.

The chocolate market boomed, South America was prosperous—the "Eskimo Pie" saved the American piano industry.

Well maybe it didn't but no matter.

The real thing is happening every year—perhaps every day—we must hang together or hang separately—none of us can succeed alone.

We all know this—preaching such a gospel seems almost childish—but look out over the business world and see how far we still are from practical realization of this great principle of cooperative effort and inter-relation.

Fire insurance wants your business to be a success but, while you are going upon your way, we want you to remember our needs and the contribution we make to your progress and achievement.

Now the fact that you are in daily contact with fire insurance engineers and that you so recognize the inter-relation of your business and ours is the best evidence that, upon this phase of public relations, your views and those of the stock fire insurance companies are in very practical harmony.

The first three of these public relations is cooperation—inter-relation—inter-dependence.

It is not possible, in half an hour, to go into very much detail exploiting this or other relations or interests common to industry and commerce.

THERE is one very "Public Relation" upon which I feel very strongly and which is of first importance not only to utility corporations and insurance companies, but to every business or industry.

Again, I may be open to the charge of threshing over a lot of old straw, but until the people of this country have been thoroughly educated and finally convinced, I shall not cease agitation wherever and whenever there is opportunity, against the evils of public ownership or operation of public utilities nor the encroachments of socialistic experiments in any field of endeavor.

There is a very strong feeling, as all of you know, that the public utilities of this country instead of being initiated and conducted by individual enterprise and for private profit, should be taken over by the Government, by States or by municipalities and operated as the term is used by this class of economists "for the public good."

We believe that a nation can only be great, prosperous and enduring as the individual citizens are independent and aspiring and that the kind of independence which produces this result must have as its incentive individual reward for its enterprise.

So I do not believe that the Government, the States or municipalities should encroach upon the domain of private enterprise nor do anything which individuals can and will do, I believe better and, in the long run, cheaper than by Government agency, but even if this were not true I should still believe in individual ownership and operation under proper supervision and regulation. The State should never do for the individual citizen what he can do for himself.

Senator Pat Harrison in a recent speech reduced the whole gospel to a short and convincing statement when he said at Boston "The theory of our government is repugnant to the government going into business in any case where the individual himself can do it."

It is only in those cases of the public weal where private initiative will not and cannot do it, that the Government is then justified in stepping in.

No more do I believe in socializing insurance and there is no more reason for a body of business men or manufacturers to meet and agree to insure each other and take the profit out of the business for everybody but themselves, and thus socialize it, than there is for a municipality to take over an electric light and power plant and run it as a community enterprise.

The principle involved is the same in both instances.

So while you gentlemen are very intimately and immediately concerned in this question of public ownership and operation, do not forget that we want you to exist and want to help you continue in your prosperity and that every influence we have will be exerted in this direction but we believe that, when we have fulfilled what we conceive to be our obligation to a common cause, that we may reasonably expect that obligation will mean reciprocity.

As you pass along and meet these problems and are looking about for help in their solution do not forget that the stock fire insurance companies have, and will continue to have, approximately nine-tenths of the business of this country with more than that percentage of capital investment and responsibility.

A FEW years ago a proposition was made in quite an important western city to take over the gas, light and power properties and operate them as municipal enterprise.

Naturally, the local utility company was very much disturbed by this situation and called for assistance. Among other bodies the Local Board of Fire Underwriters was urged to oppose the scheme and as a matter of fact unreservedly did so.

It was discovered, however, that the utility's property of several million dollars was all insured in a group of eastern mutual companies, and the insurance agents of the city, who were breaking their necks to help the utility people, as well as their companies which encouraged them to the effort, were penalized by the socialistic action of the utility company.

There was a sort of a grim humor in this situation which I believe will appeal to the most of you.

A good many years ago Herbert Quick wrote a book called "On Board the Good Ship Earth."

It is a volume full of rather quaint and sometimes sound philosophy and I think you will all find it interesting reading although, like myself, you very likely will not agree with many of the conclusions or implications.

The writer compares the earth to a great ship sailing upon a practically uncharted ocean with no final destination or day of arrival.

All the people are passengers and they can't get off the boat.

On board ship there is so much food, and fuel and clothing and other necessities and the question he discusses is how shall these necessities of life be apportioned and used that the voyage may be safe, pleasant and profitable.

How shall all this great passenger list conduct itself so they may get the most out of the voyage with the least discomfort and inconvenience.

THE earth, as a great ship sailing through space, has just so much iron and coal and sulphur, phosphorus, lumber and other things which go to make civilization possible and life comfortable, none of which can be replaced when exhausted, and the purpose of the book is to discuss just how these things shall be handled, what is to be done with them and who shall own or control them and kindred subjects.

Really, the subject of the book is the "Art of living together in the world," and when that theme gets a thorough hold upon your minds you will realize how such a book may contain a lot of things intimately related to such a conference as this, because after all the big thing in the world is now, has always been and always will be the "Art of living together."

When we solve that problem nothing will remain to be done and until we solve it there will be plenty of room for more sorts of cooperative thinking and doing than so far the world has developed.

The "Good Ship Earth" has sailed a long way upon her course and, while some of the passengers have made a lot of trouble and taken more than a fair share of the common store, the voyage has not been seriously uncomfortable or unsuccessful.

The world is getting better—the relations are more cordial, helpful and considerate.

In business the old *Laissez Faire* theory, which is the "devil take the hindermost," has given way to cooperation, collaboration and mutual understanding.

Competition is no longer said to be the "life of trade" but is known to be its destruction.

The world is slowly but surely solving the problem of "living together."

In the Book of Genesis, after the world's first great tragedy, the defendant tried to dodge the issue and, declining to plead to the indictment, asked the question, "Am I my brother's keeper?" and the world ever since has been asking and apparently unable to answer that question, but is still trying and making progress.

You gentlemen are here for a couple of days asking and making your contribution to the answer of the same question.

The "National Electrical Code" and its requirements may be only a drop in the great ocean of cooperative effort which will finally make the "Good Ship Earth" an ideal place to live, but it is a "drop," and if your task is well done, if you enter upon and finish your work in the spirit of mutual help and consideration, if you think of somebody else while taking care of yourselves, you will have made your little contribution to the answer of the world-old question in Genesis.

This is "Public Relation"—the interrelation and interdependence of all business and all individuals.

My friends, the world will continue the same interrogatory and hope for the same thoughtful attempt at an answer until Gabriel shall sound his horn and the millennium shall come and then, in the language of the vaudeville, we can "wash up and go home," because we will no longer be interested in the "National Electrical Code" or kindred subjects and those of us who are not playing a harp will be concerned, if the theologians are correct, with a branch of the fire insurance business where everything is a total loss.

THE COMMERCIAL DEPARTMENT'S INTEREST

By **Marshall E. Sampsell**

Chairman, Commercial National Section, N. E. L. A.

THIS Conference of Company Code Representatives has been called to furnish a general background for the important duties that you are undertaking. Mr. Day has told you how codes and standards and ordinances react in a definite way upon our industry, and I have been asked to address you on these reactions as they concern the Commercial Departments of power supply companies.

When I was made chairman of the Commercial National Section they requested me to adopt a slogan for the section, and having in mind the necessity for cooperative work, both within the N. E. L. A. and the other important branches of the entire electrical industry, I suggested we change the then slogan, "More Kilowatt Hours Per Capita,'" to "More Kilowatt Hours Through Group Teamwork." I am sure this thought was prompted in part from my experience as a member of Mr. Day's committee.

The Commercial Section has devoted itself this year principally to the handicaps to commercial progress, such as the continued increase in price of wiring, due in no small measure to code restrictions. Our Wiring Sales Committee, in conjunction with the Engineering Section, has been engaged in the study of the code.

Mr. Lloyd mentioned the necessity for proper rates. Too much stress cannot be put on this most important subject. It is not contended the rates of our operating companies are too high but that in many cases they are not set up in a form to encourage a freer use of our electrical energy. The Promotional Rates Committee of the Commercial Section, of which committee Mr. Lloyd is chairman, has been closely studying rate forms for domestic service and promotion of the adoption of inducement rates by the power companies.

With adequate and not too expensive wiring and proper rates must go hand in hand well trained salesmen, and so our Commercial Section has fully appreciated the need of "specialists" and, as a feature of our work this year, schools have been successfully organized for house lighting, industrial heating, commercial cooking and electrical advertising.

We have also been giving careful study to the prices of apparatus and to the quality standards in types of appliances we sell. You can, of course, see how intimately related this subject is to that of adequate wiring in the house, without which there is little sense in trying to load the home with modern appliances and labor saving equipment. To bring this about we cannot be content with merely technical engineering results, but must have continued and helpful cooperation from our commercially trained minds and close cooperation by all groups, other than our own, in order that we may bring into the picture some of the scenery that was so ably discussed by the counsel for the insurance companies.

I have had some suspicions, not only of the insurance people themselves, but of some of the other groups of our great industry, but those suspicions were the result of insufficient information on my part as to the real reasons why some of the opposition we construed to be just stubborn opposition on their part has been brought into this picture, and I am now firmly convinced, as we get to know each other better and put the cards on the table, discussing what each card stands for, this problem will be worked out—not in a month, perhaps not in a year—but it will be progressively worked out so that in the end the business we are entitled to secure can be added to our lines to the satisfaction of the customers we take on, and to the benefit of all branches of our electrical industry and to the other groups interested in our success.

In my judgment there is no more important work in this whole N. E. L. A. set-up than the work you are now engaged in; it is the neck of the bottle. But not only that; there is a strong cork in the top of the bottle. We want to uncork that bottle, and you are the gentlemen who can best help do it with us.

Public Relations Report

(*Continued from page* 342)

men since the dawn of society and departed from the straight and narrow way, and is not the startling record of our accomplishments in the past forty years worth something in the balance?"

The accomplishments of the past are but an index to what the accomplishments of the future may be. Our industry will continue to be a constructive force in the life of the nation only as we deserve it. It will be stable only as we are right. Being right, as I believe the industry is, as nearly as it is possible for any human agency to be right, let us not hesitate to continue to give to those for whom we are trustees of a very important service an account of our stewardship. Let us continue to fight for what we believe to be in the best interest of the American people. Let us not stoop to pettiness. Let us not sully our great industry by deeds that will not bear the searching light of day. The record of our accomplishments reveals the contribution to society and the race too valuable to need anything but straight-forwardness to insure lasting prosperity of the electrical industry.

Service Suggestions

NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman,* Public Service Co. of Northern Illinois, Chicago, Ill.

To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 72 June, 1929

Teaching Customers to Read Their Meters

By J. C. BARNES

Director of Advertising, New Orleans Public Service, Inc.

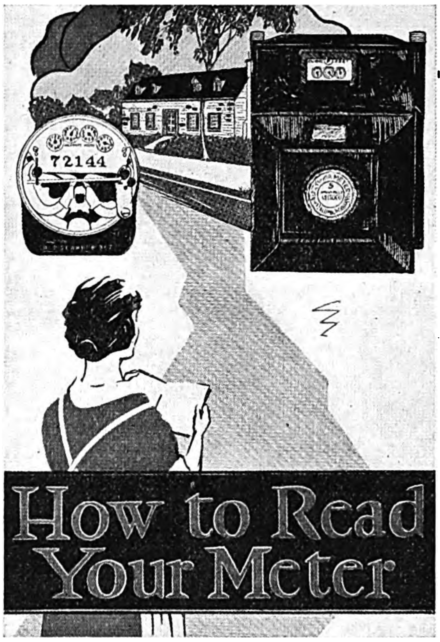
THE New Orleans Public Service, Inc., has inaugurated an extensive campaign to teach customers to read meters. There is just one purpose behind the campaign, according to officials of the company—to promote better public relations.

There are many reasons for the lack of proper understanding between utility companies and the public they serve. The fact that these companies are large corporations which enjoy monopolies operates to their disadvantage in winning good will. But perhaps the greatest obstacle to be met in a program of promoting better public relations comes from the fact that the commodity furnished is intangible and the customer has no way of checking the amount of electricity used to determine that he is not being charged for something that he did not receive.

Majority of People Honest

Our meter reading service is based on the belief that the majority of the public are honest; that the average citizen is not looking for something for nothing but is willing to pay fairly and honestly for that he knows he had received. It is the inability of the customer to check his service bill that causes the difficulty.

Mr. John Brown, for instance, receives his bank statement. He finds that his net balance is much smaller than he thought. He immediately jumps at the conclusion that the bank has made an error in tabulating his checks, or that they have charged the checks of some other Mr. Brown against his account. He forthwith totals his checks, and if his case is the usual one, he finds that he has issued a few checks which he has forgotten, or which he failed to deduct from his balance. He finds that the bank is correct and there is no alternative but to be satisfied.



72144
How to Read Your Meter

Reduced cover of Instruction Booklet for customers of New Orleans Public Service. The section giving instructions on how to read the meter is reproduced hereunder and on the next page.

It is very easy to read a meter. You can learn to read it just as easily as you learned to tell time. At first it takes a little while and appears difficult, but after a little practice the dial can be read at a glance, just as you can tell the time by a glance at the watch or clock.

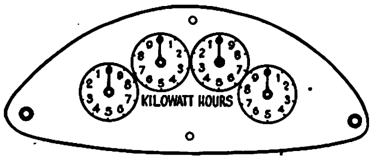


Figure 1

Mrs. Brown Can Check Her Grocery Bill

Mrs. John Brown receives her grocery bill or drug store bill at the end of the month. The total may be surprising. It may be so large as to instantly arouse a suspicion that there is an error, due to the negligence of the store in accounting, or a willful desire to defraud. This suspicion can either be dispelled or definitely confirmed by checking the items on the bill. Not so with the gas or electric bill. If there has been an unusual number of dark days requiring an extraordinary amount of artificial light, the customer has no list of these unusual days by which he may determine whether he has actually used the service or not. He usually jumps at the conclusion that the meter reader has made an error in reading his meter, and not having any way of checking it himself, the suspicion lingers in his mind and ill-will against the utility company is created.

But it is obvious that if the customer can read his own meter accurately he has the same facility for checking his gas and electric bill that he has for checking his bank statement or his grocery bill. That being so, one of the greatest causes of friction between utilities and customers is removed where customers are equipped to check their meter readings.

Not a Mere Gesture

With this basic psychological fact in mind, this company began a study to determine the best manner in which to conduct a meter reading campaign that would overcome the condition. Of course, it could have been offered in such a way as to be a mere gesture. Small pamphlets could have been printed and the public asked to write in for them, but it was not the thought of the department to make a mere gesture.

The company was convinced of the value of the customer meter reading service and was sincere in wanting to offer a real effective service. It was decided to install a meter reading school on the first floor of the company's down town office building. Standard meters and special instruments designed to simplify the teaching of meter reading were installed. A meter reader who had had years of experience and who was known to be of a friendly and affable nature and who possessed the ability to instruct was selected to conduct the school.

Wide Publicity Given Plan

Car cards were placed in all of the street cars of the city calling attention to the new service. Inasmuch as approximately 80 per cent of the New Orleans public rides the street cars, this alone proved a very valuable medium. Stickers were also attached to the gas and electric bills calling attention to the new service. Articles were carried in the street car "Service" bulletin, a leaflet placed in the cars each week with an estimated circulation of 100,000.

By the use of these mediums a very comprehensive publicity program was used to acquaint the public with the new service.

Newspaper advertising was freely used to announce the plan and to aid in putting the idea across. A series of display advertisements was released to the four daily papers of the city. A large advertisement captioned "YOURS IS READY NOW" announced the opening of the reading school. The copy was featured by a cut of a booklet, "How to Read Your Meter."

Instruction Booklet

The booklet referred to was made up in an artistic manner with a three-color cover. It contains 18 pages and offers a simple, comprehensive course in reading meters. It is well illustrated and simple problems are given by which almost anyone who can read can learn how to read meters. An added feature of the book, which it was expected would cause it to be kept in the home as a reference, was the inclusion of a table showing the net bill corresponding to every monthly consumption from 0 to 200 kw-hr. under the company's rate schedule. It was the belief of the company that this table would prove a great convenience to the customers in calculating the amount of their bills after they had read their meters. Several thousand of these booklets were ordered with the request that the forms be held in case extra numbers were required. The subsequent demand made it necessary to place large additional orders.

Readings should be taken from right to left.

The right hand pointer governs the one on its left in each instance.

A complete revolution of the pointer in the first circle on the right hand indicates 10 kw.-hr. The next to the left indicates, in one revolution, 100 kw.-hr. The next similarly indicates 1,000 kw.-hr., while the pointer in the circle on the extreme left, in one complete revolution, indicates 10,000 kw.-hr.

When a hand or a pointer on any of the circles is between the figures 2 to 3, 3 to 4, etc., the smaller number is always read.

The hand or pointer on the circle to the right must make a complete revolution, that is, reach zero, before the pointer in the next circle to the left has moved one space or division, that is, from 1 to 2, 3 to 4, etc.

To obtain the consumption, substract the previous reading, shown on your last bill, from the present reading. The difference is the number of kw.-hr. used.

For convenience, "kilowatt hours" is usually abbreviated to "K W H."

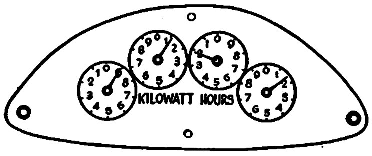

Figure 2

Fig. 2 is an example of an ordinary dial reading.

Commencing at the first circle on the right, the last figure passed over by the pointer, reading clockwise, is 1.

The next circle to the left shows the figure passed to be 2, bearing in mind that the direction of the rotation of this pointer is counter clockwise.

The last figure passed by the pointer on the third circle to the left is 1, while that passed by the last pointer to the left is 9.

The reading to be set down, therefore, reading from left to right is 9121.

If, for example, the reading shown on the bill for the month previous was 9105, it is to be substracted from 9121, the present reading.

Thus, from	9121
Substract	9105
The difference is...........	16

This difference of 16 is the number of kw.-hr. (K W H) used in the period between readings.

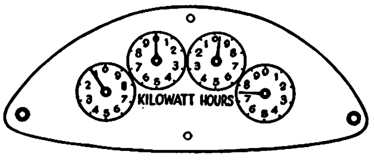

Figure 3

In a similar manner the dial shown in Fig. 3 may be read. In this case, however, three of the pointers rest nearly over the numerals, and care must be used to follow the directions to avoid error.

Commencing at the right, the first pointer reading clockwise indicates 7; the second pointer, reading counter clockwise, has passed 9 and is approaching 0.

The third pointer appears to rest directly over 0, but since the second pointer reads 9, the third cannot have completed its revolution, and hence the figure last passed is set down, which in this case is 9.

Similarly, the fourth or left hand pointer appears to rest directly over 1, but referring to the pointer next to it on the right, we find that its indicator is 9, as just explained. Therefore, the fourth pointer cannot have reached 1, so we set down the last figure passed, which is 0.

The figures as they have been set down, therefore, reading from left to right are 0997, which is the correct reading.

If, for example, the reading shown on the bill for the month previous was 980, it is to be substracted from 997, the present reading.

Thus, from	997
Subtract	980
The difference is...........	17

This difference of 17 is the number of kw.-hr. (K W H) used in the period between readings.

Another newspaper advertisement captioned "HE WILL SHOW YOU" was released for the second week. This featured a picture of the meter reader selected to teach customers how to read their own meters. This ad also announced the hours of the school to be conducted in the company's down town office and offered to furnish copies of the booklet free. The public was advised that a booklet would be sent in response to telephone or mail requests if it was not convenient to call at the company office.

For the third week of the new service an advertisement captioned "IT'S EASY TO READ YOUR METER" was released. The copy featured an electric meter and a photograph of the meter reading school layout. A blank form for convenience in ordering the booklets was also included. A fourth newspaper advertisement was headed by the query, "CAN YOU READ YOUR METER?" This series proved very effective in acquainting the company's customers of the new service.

Popularity of Service Continued

At the time this article is written the service has been in effect for over two months and the meter reader instructor is kept almost as busy now as he was the first week that the service was offered.

The enthusiastic response of the public to the meter reading service exceeded all expectations, demonstrating conclusively that the company had correctly analyzed one of the causes which results in ill feeling on the part of the customer. Thousands of our customers were anxious to know how to read their meters and quickly availed themselves of the opportunity to acquire this knowledge.

It cannot be doubted that many of these customers had at one time or another harbored the feeling that they had been overbilled for electric service they had used through wrong meter reading.

Whether the customers will check the reading of their meters from month to month is to be seen, but what our customers in this city know is this, that the company has made a sincere effort to acquaint each and every one of its customers in the simplest, most convenient and effective manner possible, with the knowledge of how to read their own meters. Even if customers do not check readings or bill computations their possession of this knowledge will do much to improve their attitude toward the company and build confidence in the meter.

Public Realizes the Effort Is Sincere

The public of this city knows that the company was, and is, sincere in wanting all of its customers to know how to read their meters. That in itself has done much to overcome that basic suspicion that everyone has when he pays a bill, the amount of which he has no means of checking to determine its accuracy.

It is the belief of the officials of the New Orleans Public Service, Inc., that, from a standpoint of promoting good public relationship, the customer meter reading service has proved one of the most effective things done with that purpose in view. It is their belief that the service will have a far reaching and continued effect. In all probabilities the customer meter reading service may be resumed again at some later period in order to afford new customers the same opportunity of acquiring this information that has been offered to those who are now customers of the company.

Electric Light and Power Statistics for Month of March

INTERESTING trends are outlined by a comparison of the performance of the electric light and power industry during the first quarter of 1929, as compared with figures for previous years. Electricity sold to consumers increased by 11.8 per cent over the same quarter of 1928, reflecting in large measure the much higher level of industrial activity this year. Domestic service, especially, has been stimulated not only by the growth in the number of consumers but also by a substantial increase in the amount used *per consumer* and shows a growth of 14 per cent, as compared with 14.9 per cent for the entire year 1928.

Revenues received from the public have, however, not kept pace with kilowatt-hours sold. During the past first quarter, they were 7.5 per cent above the corresponding period of last year, as against a gain of 8.2 per cent during the entire year of 1928 and of 13.3 per cent during 1927. This reflects, in no small degree, the results of the industry's general policy of passing on to the public the benefits resulting from the economies of improved engineering and management.

The number of new domestic consumers is slowly declining. During the twelve months ending March 31, there were 1,147,400 homes added to the lines of the country's electric light and power enterprises. This compares with 1,213,000 during the twelve months ending February 28, and 1,204,000 for the similar period ending January 31. This, however, is in line with expectations, inasmuch as the aggregate of unwired houses is steadily diminishing in urban communities and the number of new customers depends more and more upon new building construction. This, in turn, is showing increasing signs that the deficiency in housing which originated during the war period is rapidly being overcome.

Statistical Data for the Electric Light and Power Industry —1928

Statistical Bulletin No. 3, the third of a series to be issued at intervals for the information of all interested in the electric light and power industry and covering operations for the year 1928, has been completed and is ready for distribution. It is strictly comparable with similar Bulletins covering the years 1926 and 1927, and accounts for the entire operations of the industry, including the light and power business done by electric railways. Copies are available at N.E.L.A. Headquarters without charge and the report will also later be reprinted in this BULLETIN. It is also expected that a further elaboration of these figures, together with important items which have appeared during the past year in "Electrical News Items" will be incorporated in a new revision of the statistical section of the Association's handbook: "The Electric Light and Power Industry in the United States."

Basic Information on the Electric Light and Power Industry

As of March 31, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the BULLETIN.

1.	Value of plant and equipment (estimated)	$10,150,000,000
2.	Total generating capacity in kw	27,790,000
	Steam	19,910,000
	Waterpower	7,584,000
	Internal combustion	296,000
3.	Total number of customers served	23,627,000
	Farm customers (included below)	208,000*
	Domestic customers	19,267,000
	Commercial customers	4,260,000
4.	Population in electrically lighted homes (Electrical World)	81,500,000
5.	Percentage of homes which are served with electricity	66
6.	Miles of transmission lines (11,000 volts and above) (1927) (circuit miles)	150,000

---

*As reported by some 186 companies only.

N. E. L. A. Index of Industry and Trade

ALTHOUGH February and March failed to surpass the extraordinary high level attained in January, the first three months of 1929 mark the busiest first quarter of any year since the remarkable winter of 1919-1920, according to the Electrical Index of Industry and Trade, compiled by the association. Great industrial activity, as indicated by the production of electricity, is shown for the entire region east of the Mississippi and north of the Ohio and Potomac rivers.

Preliminary reports indicate figures for April considerably in excess of those of March and reaching the highest level thus far attained by the Index.

The index, month by month for the last two years, stands as follows:

Electrical Index of Industry and Trade

	1927	1928	1929
January	104.9	103.2	109.0
February	103.8	104.7	107.9†
March	106.9	105.0	107.8*
April	106.8	104.6	111.9*
May	106.3	106.6	
June	106.1	106.0	
July	104.8	107.1	
August	104.9	108.9	
September	104.8	106.8	
October	102.6	109.0	
November	102.9	107.8	
December	103.1	105.0	

---

*Subject to revision. †Revised.

The N. E. L. A. Index of Industry and Trade is based upon the deviation of the total output of electricity by all agencies which contribute to the public supply plus imports from Canada, from a computed "normal" figure for each month, which "normal" is adjusted for the continued growth of the light and power industry and is further corrected for seasonal variation.

Inductive Coordination at Carrier Frequencies Under Study by Joint Committee

At the time of the formation of the Joint D. and R. Subcommittee in 1922, the use of carrier frequencies by either the power companies or the telephone companies was in an early stage of its development. However, its possibilities were recognized and a study of the inductive relations at these frequencies were included in the program of the committee together with the studies at fundamental and voice frequencies. The recent expansion of the use of carrier currents by both industries has fully justified this decision. The relatively few cases of interference involving carrier systems that have occurred show that the engineers engaged in the development of this art fully appreciate the necessity for inductive coordination. It has been recognized that for the present, while the art is in a state of rapid development, coordination of telephone line and power line carrier systems by frequency separation is the most practical solution. It is, however, becoming increasingly difficult on account of the present multiplying uses of carrier systems to completely avoid the use of the same frequency ranges for carrier systems on the two types of lines.

The problem of inductive coordination at 60-cycles and the lower harmonic frequencies faced the industries before any serious joint consideration was given to it and practices had become established which would not have been tolerated if the present knowledge had been available during the development of the art. In the case of carrier frequencies, it is believed, this condition will be avoided by the work of Project No. 9* without in any way hindering the development of the art.

The problem assigned to this project committee can be divided into three major parts: the first dealing with characteristics of power lines and equipment, the second with coefficients of induction, and the third with characteristics of telephone lines and plant. The solution of this problem requires a theoretical analysis of each part and the testing of the theoretical conclusions by actual measurements of the quantities involved.

At the time this committee was formed very little apparatus had been developed which could be used for this work and very little was known of the methods which were applicable to these measurements. Consequently, the early work of the committee was devoted almost entirely to studying methods of measurement, developing apparatus and testing it in the field. From this early work it has been found that for currents within the carrier range of frequency commercial current transformers with their associated secondary burden could be readily used for connecting the especially developed measuring apparatus to the power circuit. This part of the study was conducted at the Pittsfield Works of the General Electric Company, where a number of types of current transformers were available for tests.

Early in the investigation it became apparent that a method and technique of making measurements in the medium between the power and telephone systems, rather than interrupting either service to make measurements in these systems, was very desirable. Since the frequency band covered in this investigation extends from 5,000 to 80,000 cycles per second, it was decided to develop a magnetic field intensity measuring equipment similar to that already used in making measurements at radio frequencies. This equipment consists of a tuned loop connected to an eight-stage vacuum tube amplifier, the output of which is measured by an indicating meter. The voltage picked up and amplified by the tuned loop-circuit is measured by an eight-stage amplifier specially constructed for this work. Special anti-capacity switches permit the use of from three to eight stages in making measurements. Calibration curves for this amplifier show that the amplification is approximately uniform throughout the frequency range used in these investigations.

It has been found that with proper precautions in the design and operation of this equipment, no serious errors in the readings are produced by the presence of electric fields.

In addition to the tests which were conducted at Pittsfield this committee has utilized the system of the Utica Gas & Electric Company for an investigation, and is now conducting a study on an experimental line in New Jersey. The work done at Utica is covered in an engineering report recently issued by the Joint Subcommittee entitled "Study of High Frequency Currents in Power Lines Resulting from the Charging of Electrolytic Lightning Arresters."

The Utica tests made it very evident that, for the fundamental research on this problem, an experimental line was required which would be free from the influences of other overhead lines or underground metallic structures, and where all conditions at the time of test would be under control. A test location was therefore secured in the southern part of New Jersey and the necessary lines and equipment erected. The work which has been carried on there includes the following measurements at carrier frequencies.

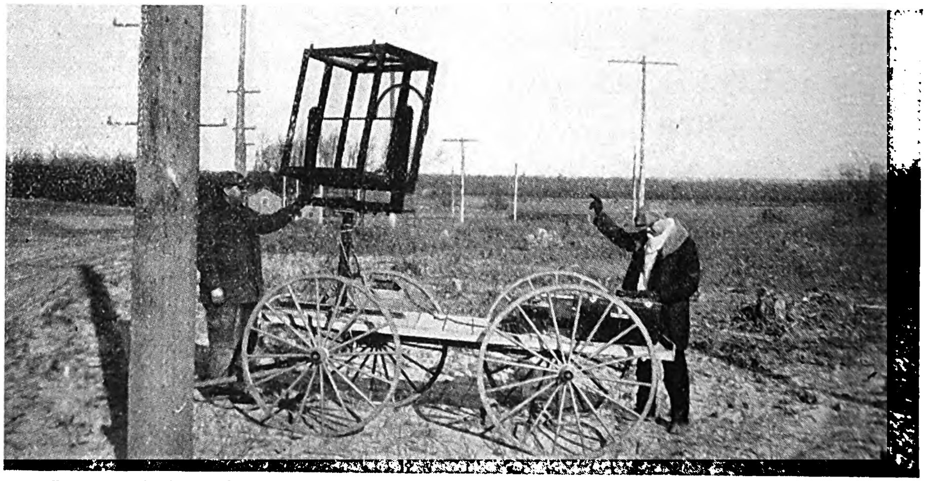
a. The magnetic field around a wire with ground return terminated in its characteristic impedence;

b. The magnetic field around a wire with ground return with reflections at the far end;

c. Residual current in a single wire with ground return;

d. The magnetic field between a telephone wire and ground.

A review of the program of the committee shows that much of the necessary work has been done in the study of the characteristics of the power system and of coupling coefficients, the third item,



Loop and Amplifier used to measure magnitude and direction of magnetic fields that of the characteristics of the telephone system will be taken up upon the completion of the present program of work.

---

*Of the Joint Subcommittee on Development and Research of the Bell Telephone System and the National Electric Light Association.

Principles for Physical Relations of Circuits Adopted by National Electric Light Association and Western Union

THE Joint General Committee of the National Electric Light Association and the Western Union Telegraph Company has approved the report of its subcommittee of engineers appointed to investigate the general situation with respect to relations between electric light and power circuits of the N. E. L. A. member companies and communication circuits of the Western Union Telegraph Company, and recommends the general principles adopted for the solution of specific problems involving physical proximity between circuits of the two classes of utilities.

The subcommittee's report, which has been approved by the Joint General Committee, indicates that complete agreement exists as to standards of construction to be employed at crossings, conflicts and for all jointly used poles. As regards joint construction certain preferences between this and other forms of construction are given, as well as the general underlying factors that must be taken into consideration in applying such preferences. As to parallel construction, the general principles are recommended which show the way to a satisfactory solution of specific cases. In addition the subcommittee has included in its report certain principles to be applied in the solution of all the varieties of situations involving proximity.

The subcommittee of engineers has been instructed to continue with its work and prepare a more detailed set of principles and practices. A subcommittee on development and research has also been appointed to study the art of inductive coordination involving these classes of circuits.

As soon as standards of construction and operation are adopted the committee will undertake the determination of principles to aid in the fair allocation of costs of coordinative measures. In the mean time it is believed that with the cooperative spirit, which now is evident, a mutually equitable adjustment can and should be made in each specific case.

Copies of the report may be obtained from the National Electric Light Association, 420 Lexington Avenue, New York, N. Y., or from the Engineering Department of the Western Union Telegraph Company, 195 Broadway, New York, N. Y.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Southeastern Division Convention

THE Southeastern Division, N. E. L. A., Convention held at Asheville, N. C., May 8-10, attracted more than five hundred delegates with its fine program of addresses. Sports and entertainment offered in the mountain city added to the general enjoyment.

At the opening session President C. A. Collier pointed out the notable trend toward utility consolidation in the South and said that this made possible universal electric service in that region and permitted many economies in utility management. He said the utilities were doing a great deal to develop the industrial possibilities of the South. They should capitalize on this feature of their service and should also develop good will by cooperating in every progressive movement for improving the region industrially. He remarked that by "monopoly" was meant merely the privilege of giving service, but that the task of the utilities at present was to intensify and extend the service they rendered. Utilities are competing for customers' dollars with other industries, he said, and they must sell as well as produce.

Nap H. Boynton outlined plans for the celebration of "Light's Golden Jubilee" and urged the South to join in the tributes to Mr. Edison. I. M. Bailey of the North Carolina Corporation Commission made an able address on utility regulation. He pointed out the trend toward Federal regulation and urged that steps be taken to check this trend by developing to the fullest extent cooperation between State commissions and utilities that cross State boundaries. He believed there would be no necessity for Federal regulation if the utilities and the State commissions cooperated fully in solving the problems connected with diversified security holders, non-uniform practices and interstate energy sales.

A feature of the meeting was an address by James L. Madden, a vice-president of the Metropolitan Life Insurance Company. He announced the completion of an economic and industrial survey of the United States and Canada. This survey showed that during 1926 and 1927 in six Southern States 751 industrial plants changed locations. Of these 596 were added industries and 155 represented losses in industry. The survey showed that towns of from 4500 to 12,000 population gained the largest percentage of new industries. Of the 596 new plants, 402 represented industries developed locally, 80 were imported and 114 were branch establishments to take advantage of the market area. Labor was the primary reason given by all industries for locating in the South.

President Arkwright of the National Association paid a tribute to the rapid progress of the South. He said that the Southeast had led the nation in percentage of increase in production and use of electric power during the past five years.

Harry M. Hitchcock of *Printers' Ink* told the convention he thought the prime cause of misunderstanding between the power company and its customers was the fact that the power company considered itself a manufacturer while the customer looked upon it as a retailer. It was his opinion that advertising was the medium to weld the different viewpoints. Stewart L. Mims, vice-president J. Walter Thompson Company, with the use of slides presented the convention with certain of the information gleaned by that company in its market development survey for the electrical industry. Mr. Mims' talk ranged around "woman power" in the home, rather than man power in industry, and showed the market development possibilities in the homes already connected to central station lines.

Dr. Gus Dyer, dean of business economics, Vanderbilt University, in an able address, said that the people of this country were no longer afraid of "big business" because through customer ownership of securities big business was big only in the sense of the volume of business done. He touched also on the decentralization of industry and what this would mean to the Southeast. John G. Jones of the Alexander Hamilton Institute thought that the seeming decentralization of industry was really local development which was making new industrial centers.

Talks at the section meetings included one to the Engineering Section by L. W. W. Morrow, editor, *Electrical World*, on "Utility System Planning," and one by F. V. Andreae, Southern Manganese Corporation, concerning future growth in the field of electro-chemical industry. A. Edwin Fein addressed the Commercial Section on the subject of merchandising psychology, while Fred W. Herbert of the N. E. L. A. addressed the Accounting Section meeting. Miss Mamie Kennedy of the South Georgia Power Company, Albany, won the women's public speaking contest.

The following officers were elected for the coming year: President, T. H. Tutwiler, president Memphis Power and Light Company; first vice-president, H. E. Cox, Birmingham Electric Company; second vice-president, J. V. Strange, Carolina Power and Light Company, Raleigh; third vice-president, J. C. Guild, Tennessee Electric Power Company, Chattanooga.

Middle West Division Convention

THE seventh annual convention of the Middle West Division of the National Electric Light Association met at Omaha on April 24, 25 and 26. One day was given over to the meetings of section committees, all of which were well attended and aroused much interest.

From these meetings came reports of important developments and projects affecting the Middle West Division, among which were the power survey embarked upon by the Engineering Section and news from the legislative battle front of Iowa, Missouri, Kansas and Nebraska. This news indicated that, in spite of the apparently radical political tendencies of these states, legislation promoting government ownership and operation of electric utilities is not making much progress—contrary to the general impression created and fostered by the headlines in certain newspapers.

J. F. Owens, chairman of the Public Relations National Section, made a logical and forceful argument for continuing and extending the consideration of the human equation in all activities of the business. He stressed the necessity for careful selection of employees.

His long experience in the field of research made C. E. Skinner a well-qualified speaker on the value of research in the electrical industry. Mr. Skinner traced the progress of research from its beginnings in the devoted efforts of single individuals to the organized probing into the unknown that is carried on in the great laboratories of the present day. Too much satisfaction with American methods and practices was not evident in the address by A. D. Bailey, who spoke on electrification in Europe. Although American electrification is much greater than European in terms of magnitude and wide application, it would be a mistake not to recognize the importance of present-day European contributions and development in the electrical art, Mr. Bailey said.

N. H. Boynton outlined the plans which have so far been made for the observance of "Light's Golden Jubilee" in commemoration of the fiftieth anniversary of the invention of the incandescent lamp. Another prospective activity was treated by Paul Zimmerman, who spoke of the plans of the National Food Preservation Council, which will seek to inculcate a "national refrigeration consciousness" by concerted activity. On account of illness, Sam A. Baker, ex-Governor of Missouri, who was on the program, was unable to attend. In his address, which was read into the record, he stated his opinion that there should be a course of study in the public schools on public utilities and their service and relation to the public.

The extremes in precipitation and the wide seasonal variation in the flow of streams make it difficult to estimate the hydro-electric potentialities of the Middle West, said C. W. Place, in his address on that subject. He thought that there is a possibility for utilization of this power by coordination of its seasonal availability with established systems. However, the actual amount of such power is extremely small in comparison with the demands of the territory and its development remains far in the future. Kenneth McIntrye presented a résumé of the survey recently completed under the direction of the National Electric Sales Conference. The results are not such as to inspire any self-congratulation, indicating as they do a comparatively small domestic utilization of electric service.

These new officers were elected: President, A. E. Bettis, Kansas City, Mo.; vice-presidents, A. R. MacKinnon of Omaha, C. A. Leland, Jr., of Des Moines, and W. W. Austin of Cottonwood Falls, Kan. New officers of the Iowa Section, Middle West Division, were also elected, as follows: President, C. S. Macy, Des Moines; first vice-president, G. A. Neal, Sioux City; second vice-president, H. C. Orton, Dubuque; secretary-treasurer, H. E. Weeks, Davenport.

Southwestern Division Convention

RURAL electrification was declared to be the most important factor facing the electrical industry in the Southwest by J. G. Holtzclaw, president of the Southwestern Division, N.E.L.A., in his address before the division's annual convention in Hot Springs, Ark., April 30 to May 3. This convention was held jointly with that of the Arkansas Utilities Association. Six hundred members attended.

Mr. Holtzclaw said the farmer does not want to be subsidized, nor is he an object of charity, but he does want an even break on electric service, which means so much to his comfort and prosperity. Mr. Holtzclaw also discussed the use of long-time payments in selling merchandise, and stated that although the utilities desired to have all the sales outlets possible, the chief goal was to increase domestic use.

President P. S. Arkwright of the N.E.L.A. stressed the duty of utilities to bring to the public the advantage of electric service. He pointed to the fact that there is no middleman in the utility business and that the economic benefits and the comforts inherent in electric service can get to the public only through selling and advertising by the utilities. This is one thing that government ownership advocates neglect, Mr. Arkwright said, and the present electrification of this country has come about only because electric service has been sold to the users, often in competition with other services.

Other notable speakers at the convention were W. E. Bann, president of the Arkansas Utilities Association, who dwelt on the rapid growth of the Southwest; Charles W. Appleton, vice-president, General Electric Company; W. J. Hagenah, John V. L. Hogan, E. H. Sniffen, H. C. Couch and H. B. Flowers.

The several sections held meetings and discussed reports and addresses dealing with public relations, commercial affairs, engineering developments and accounting activities. A notable report by the competitive power committee of the Commercial Section covered detail power and load requirements for the major industrial plants of the Southwest.

Features of the Engineering Section meeting were the reports of the committees and the discussion of the address on system planning made by L. W. W. Morrow, editor *Electrical World*. There was agreement that utility advertising in newspapers was essential.

F. W. Insull of Tulsa, president Public Service Company of Oklahoma, was elected president of the Southwestern

Division, N.E.L.A. The new vice-presidents are H. C. Couch, president Arkansas Power & Light Company, Pine Bluff, Ark.; M. T. Walker, Southwestern, Gas & Electric Company, Shreveport, Miss.; B. E. Eaton, Mississippi Power Company, Gulfport, Miss., and Samuel E. Wolff, Oklahoma Power & Water Company, Sand Springs, Okla. E. E. Ehret was elected treasurer and S. J. Ballinger, San Antonio, Tex., reappointed secretary.

New officers for the Arkansas Utilities Association are: President, Robert E. Ritchie, Arkansas Power & Light Company, Pine Bluff; first vice-president, R. W. Curran, Little Rock, second vice-president, O. H. P. Moss, Blytheville; secretary and treasurer (re-elected), Rex I. Brown, Little Rock.

East Central Division Convention

THE convention of the East Central Division of the National Electric Light Association held at Louisville, May 7-10, offered an unusually fine program to the attending delegates.

Martin J. Insull asserted his faith in publicity as the means for laying the foundation of public understanding on which the utility industry must stand. Such publicity should cover every utility activity from the technicalities of production and distribution through management and finance. Consolidations and mergers are becoming so frequent as to be confusing and suspected, and complete candor on these operations is essential, Mr. Insull declared.

P. S. Arkwright, president of the N. E. L. A., reiterated the logical and well-expressed justification of the electrical utilities in the eyes of the nation. Managing Director Clapp followed Mr. Arkwright with a comprehensive picture of the contributions of the electric utilities to the prosperity and progress of the United States.

The accountant had his day in court through two able representatives, Dr. John T. Madden of the University of New York and J. H. Lobban of the Detroit Edison Company. Concerning machines for billing and other accounting duties Mr. Lobban said that their use was not necessarily desirable for economy but for speed, because the value of accounting information is essentially a news value existing here and now. Doctor Madden predicted the disappearance of the prejudice against non-voting common stock and the acceptance of this form of security for trading on the New York Stock Exchange within five years. He ridiculed the idea of utilility propaganda or any other interested effort affecting the opinions or teachings of educators.

In an excellent address Prof. A. G. Christie of Johns Hopkins University discussed "Power Generation, Present and Future." Professor Christie indicated the probable development of power-plant apparatus and devices in detail as they appear to him from present tendencies. A theoretical set-up, departing in only slight degree from ideas and equipment of the present, which would produce a kilowatt-hour for 8000 B.t.u. was thought by the speaker to be something that might be confidently expected reasonably soon. He predicted a lessening of the importance of vacuum for exhaust reception and said that higher entrance steam pressures would allow higher outlet back pressure and thus remove from steam operation the requirement of large volumes of cooling water. The processing of fuels for recapture of their byproducts and the extension of central-station services through the sale of steam for heating and industrial work are indicated in the near future. A better utilization of fuel through power interchanges between industrial concerns and central stations is also not far off.

In response to his own question "Can We Make Rural Electrification Pay?" Charles F. Stuart came forward with an emphatic affirmative. He said that rural service can now be talked about in terms of dollars and cents, as well as in terms of public relations, which until lately was the only language for it. The same optimistic feeling was shown by Dr. E. A. White, who said that complete rural electrification waits only on the general improvement of the farmer's economic condition.

Prof. G. W. McCuen of Ohio State University asserted that the trends toward mechanization in the development of farm operating practices are resulting in a decline of the ratio of farm to urban population. He presented a series of different rates for rural service and the prices per kilowatt-hour which would result from them as applied to the Ohio experimental lines. Although the different rates were very diverse in form and statement, yet in the final analysis there was comparatively small divergence between them in the actual prices per kilowatt-hour, particularly for large consumptions of energy.

National commercial plans and programs were explained by C. E. Greenwood, who asserted that electrical merchandise must be produced and sold with a price appeal to two different classes of buyers. In one class are those to whom price means little and who insist upon appearance and novelty. In the other and much larger class price is the most important consideration, but appliances made for this market must not be reduced in quality as affecting performance.

An address on the technique of salesmanship was made by W. R. Braasch, president of the Salesmanship Foundation. J. C. Langdell spoke on domestic electric water heating, holding that this load must be built up on the condition of off-peak service and rates and that for real volume in it the kilowatt-hour rate must be down to at least one cent. Public speaking as an activity for central-station employees was championed by W. S. Vivian, national committee chairman; E. H. Sniffen of the Westinghouse company said that no other thing had so good a domestic selling appeal as electric service and advocated intensive selling practices. Dr. J. Slepian, also of the Westinghouse Company, described the new Deion circuit breaker; H. M. Towne of the General Electric Company spoke on the development of the lightning arrester; M. F. Smalley, Ohio Power Company, presented an excellent paper on the rating of meter capacities to residential loads, and Alexander Maxwell spoke on wiring codes and standards.

Officers elected were: President, L. V. Herrington, president Kentucky Utilities Company, Louisville; first vice-president, C. H. Hartesty, Monongahela-West Penn Public Service Company, Fairmont, W. Va.; second vice-president, G. E. Miller, Cleveland; third vice-president, C. L. Proctor, Toledo (Ohio) Edison Company.

New England Division Elects Officers

AT the annual meeting of the New England Division N. E. L. A., held April 11, the following officers and executive committee were elected for 1929-1930, to take office on July 1, 1929:

C. H. Hodskinson, president; H. E. Duren, vice-president; W. C. Bell, vice-president; F. L. Ball, treasurer. Executive committee: G. S. Williams, Maine; W. A. Buttrick, New Hampshire; M. G. Clark, Vermont; E. S. Hamblen, Massachusetts; David Daly, Rhode Island; A. D. Colvin, Connecticut; I. W. Day (ex-officio), Connecticut; J. P. Alexander, Boston; T. S. Knight, Boston; K. L. Norris, Boston; W. G. Stretton, Woburn.

The fall convention will be held from Sept. 9 to 12, inclusive, at the Hotel Griswold, New London, Conn.

Joint Convention of Indiana Associations

By WILLIAM STOKES

SUBJECTS ranging from "Superpower Exists for the Local Customer" to "Obtaining Data on System Operation" and "Unaccounted for Gas" featured the three-day annual joint conventions of the Indiana Public Utilities Association, the Indiana Gas Association and the Indiana Electric Light Association at Gary, Ind., the first three days of May. Larger crowds than ever before have registered for the Indiana conventions were on hand for the various sessions which were held in the new and very modern Hotel Gary. The annual dinner of the three associations was held on Thursday evening, May 2.

The Indiana Gas Association, of which T. J. Kelly of the Northern Indiana Public Service Company, Fort Wayne, was president last year, was in charge of the first day's sessions on May 1. One of the distinguished guests present at the gas meeting was Oscar H. Fogg, president of the American Gas Association.

Papers presented by members of the Association and invited speakers were: "Unaccounted for Gas," by M. I. Mix, Peoples Gas Light & Coke Company, Chicago; "Water Heaters," by Stanley Jenks, Northern Indiana Public Service Company, Hammond; "Gas Refrigeration," by H. C. Wandas, Peoples Gas, Light & Coke Company, Chicago; "Industrial Furnaces," by A. F. Mitchell, Northern Indiana Public Service Company, Hammond; "A Message from Accounting Group A. G. A.," by L. D. Spragle, Interstate Public Service Company, New Albany; "Progress of Gas Engineering School," by H. C. Peffer, School of Chemical Engineering, Purdue University, and remarks by Oscar H. Fogg, New York, president of the American Gas Association.

C. L. Kirk, of the Citizens Gas Company, Indianapolis, was elected president of the Indiana Gas Association for the coming year.

Samuel Insull, Jr., president of the Midland Utilities Company, was one of the headliners on the program of the Indiana Public Utilities Association on May 2. Harland H. Allen of Halsey, Stuart & Company, of Chicago, addressed the convention on the highly interesting and timely subject of "The Financial Efficiency of the Utility Holding Company." "Is it Worth Saving?" was the subject of an inspiring address by James B. Wootan, editor of *Public Service Magazine* and *Public Service Management.*

The following utility men from the various branches of the utility industry in Indiana were elected to the board of governors of the Indiana Public Utilities Association for the ensuing year: C. H. Rottger and F. E. Bohn, to represent the telephone industry; C. L. Kirk and F. J. Haas, to represent the gas industry; H. S. Morse and W. H. Durbin, to represent the water interests, and N. A. Perry and T. F. English, the electrical branch of the industry.

M. S. Winder, Chicago, executive secretary of the American Farm Bureau Federation, was one of the principal speakers on the program of the Indiana Electric Light Association on May 3. Mr. Winder's subject was "The Farmers' Interest in Rural Electrification."

The various phases of women's activities, particularly in the field of home economics were discussed by Mrs. Vera Ellwood of the Milwaukee Electric Railway and Light Company. Mrs. J. R. Farrell of the Indianapolis Power and Light Company, chairman of the Home Service Committee of the State Association, also spoke to the convention on the work being done in Indiana.

Merchandising methods were discussed by F. X. Mettenet, general sales manager of the Northern Indiana Public Service Company, Central Indiana Power Company and Interstate Public Service Company, in a paper entitled "Cooperative Electric Specialty Merchandising."

"Obtaining Data on System Operation" was the subject chosen by D. J. Angus of the Esterline-Angus Company, Indianapolis, for his very interesting address to the convention.

C. V. Sorenson of the Central Indiana Power Company was elected president of the Indiana Electric Light Association for next year.

Changes in Southwestern Association Constitution

By E. N. WILLIS

AT a recent meeting, the governing body of the Southwestern Public Service Association made several changes in the Constitution, so as to permit and encourage even greater cooperation in the future, than in the past, with the various Associations with which we are affiliated.

Most important of these were provisions to waive separate conventions of this Association, and encourage attendance by our membership at suitable regional conventions of their craft; especially the Southwestern Division, Natural Gas Department, American Gas Association, and Southwest Geographic Division, National Electric Light Association. Provision will be made, however, to have group or sectional meetings, at such times and places as will be profitable to our membership, for any of the groups or sections which constitute the Association.

This Association will, as for the past 35 years, represent the interests of the gas, the electric, the street railway, and telephone public service companies, in Texas and Louisiana. In the absence of a full meeting of the Association, there has been substituted an Advisory Council, to consist of one representative from each of the member companies, which shall convene from time to time, for the consideration of the general affairs and policies of the Association, and elect an Executive Committee. The Executive Committee has full charge of the affairs of the Association, and elects from its number the president and three vice-presidents, and also elects the secretary and treasurer, which latter will not necessarily be members of the Executive Committee.

Officers and Executive Committee just selected for the year 1929-1930 are:

President, Knox Lee, Southwestern Gas & Electric Company, Marshall, Texas.

First Vice President, Chairman Gas Section, Frank L. Chase, Vice President, Lone Star Gas Company, Dallas, Texas.

Second Vice President, Chairman Electric Section, J. W. Carpenter, President, Texas Power & Light Company, Dallas, Texas.

Third Vice President, Chairman Railway Section, W. B. Tuttle, President, San Antonio Public Service Company, San Antonio, Texas.

Other members of the Executive Committee:

George H. Carter, Vice President, Texas Utilities Company, Marlin, Texas.

J. G. Holtzclaw, Vice President, Gulf States Utility Company, Beaumont, Texas.

W. L. Prehn, General Manager, Southwestern Bell Telephone Company, Dallas, Texas.

Treasurer, R. G. Soper, Vice President, Dallas Gas Company, Dallas, Texas.

Secretary, E. N. Willis, Dallas, Texas.

Great Lakes Division Elects Officers

THE annual meeting of the Conference Delegates of the Great Lakes Division was held in Chicago, on May 14, 1929, and the following Division officers were elected for the fiscal year beginning July 1, 1929:

Grover C. Neff, president; Eugene Holcomb, vice-president; L. B. Andrus, vice-president; John G. Learned, vice-president; Tom C. Polk, secretary-treasurer.

The annual convention of the Great Lakes Division will be held at French Lick Springs, Ind., on Sept. 26, 27, 28.

RURAL ELECTRIFICATION

Great Lakes Division Rural Electric Service Conference

By EUGENE HOLCOMB

Chairman, Rural Electric Service Committee, Great Lakes Division, N. E. L. A.

DEVELOPMENT of further appreciation of the possibilities of electric light and power service on the farms of America was the keynote of a comprehensive conference held in Chicago, March 22 and 23, under the auspices of the Rural Electric Service Committee of the Great Lakes Division, N. E. L. A. Representatives of operating companies, equipment manufacturers, farm organizations, and Agricultural Colleges were in attendance. This was the fourth of the series of such conferences being held in Geographic Divisions in cooperation with the Rural Electric Service Committee of the National Electric Light Association. The meeting was opened by Mr. J. E. Johnson, president of the Great Lakes Division, who stated that he was pleased to see the large attendance of the leading executives and representatives of the member companies of the Division, that much of the pioneer work of organized rural electrification had taken place in this Division, and that he hoped for a full and frank discussion of the problems presented. The Committee Chairman thereafter presided during the meeting.

The program was specially arranged to bring out various viewpoints under three general headings: 1—The Major Phases of Farm Electrification; 2—Developing Appreciation of the Possibilities of Electric Light and Power Service on the Farm, and 3—Selling Equipment to the Farmer.

That the electric power companies of the Great Lakes states, Michigan, Illinois, Wisconsin and Indiana, are beginning to make definite progress in the matter of providing and developing electric service for farms on a basis satisfactory to farmers and to utilities was evident from the interesting papers and the earnest discussions that featured the conference.

Real Advancement Made

The conference brought out unmistakably the fact that real advancement has been made toward solving the host of rural electrification problems, economic, technical and educational, that in the past have so bewildered the power companies and prospective rural customers. The old bewilderment, it was demonstrated, is giving way rapidly to clear-headed, forward-looking, constructive thinking. This thinking is being applied to construction, to rates, to research on the application of power to farm operations, to equipment, to selling, to service, to education.

Old problems remain and new problems are constantly arising, but active efforts are being made to settle them. And the efforts are bearing fruit. One by one the difficulties in the way to profitable farm electrification — profitable to farmer and to utility—are being whittled away.

"The Aims and Objectives of the Conference" were stated at the opening session on Friday morning, March 22, by Charles F. Stuart of the Northern States Power Company. Mr. Stuart declared that had the conference been held six years ago there would have been nothing to talk about, as the utilities knew little or nothing about the subject of electricity on the farm. "Today," he declared, "we have progressed to a degree which enables us to proclaim that we know considerable about it, this progress being due largely to our various experimental investigations."

"Six years ago," said Mr. Stuart, "less than 200,000 farms in the United States were being served by electric light and power companies. Now a count in about thirty states shows something like 360,000. The total in the forty-eight states, undoubtedly, is well over the 500,000 mark. This is an increase of at least 150 per cent in six years. Now that we know a great deal about this subject, the development and number of farms connected from now on will be at even a higher rate of speed."

Mr. Stuart touched upon the building up of an acceptable power load on the farm. "There is no way in the world" he declared, "to serve a farmer using only 300 kw-hr. a year under average conditions at a price generally acceptable to farmer and power company. When, however, the farmer gets up to 1200 kw-hr. a year the thing becomes a feasible, practical operation. That such a load can and is being developed is best evidenced by illustrations from more than forty states of actual farmers who are using in excess of 3000 kw-hr. a year. The load does not stop at 3000 kw-hr. but runs up among these examples to 50,000 kw-hr. and 60,000 kw-hr.

G. C. Neff, vice-president of the Wisconsin Power and Light Company, spoke on "Organization Work of the Rural Service Department." Mr. Neff declared, "A public utility company, operating in rural territory and supplying electric service to the farmers, cannot hope to be successful in this work unless those responsible for the operation of the company really believe that farm electrification can pay its own way, that there is a load on the farm sufficient in amount to justify the expenditure for required distribution lines, that the farmers can afford to pay the necessary charges for this service, and that they can profit by its use."

E. F. Kelly who appeared for J. Paul Clayton, vice-president of the Central Illinois Public Service of Springfield, told of the C. I. P. S. rural distribution system. He said that instead of extending distribution lines piece-meal to satisfy purely local needs as they came up, the company had worked out a definite distribution extension plan looking toward wiring to meet future needs of the system rather than to satisfy immediate requirements. When extensions are made to care for new customers they are made in accordance with this plan.

"Farm Rate Structures" was considered by Winsor Martin of the Byllesby Engineering and Management Corporation, Chicago. He presented the usual types of rate structure based upon getting an adequate return from each class of customers for the service given them. His paper developed the idea of a "compensatory return."

Future Load Building

In the discussion of this matter at various points in the conference, it was brought out that certain power companies which have been pioneering strongly in farm electrification have abandoned the immediate compensatory return theory in framing or revising farm rates in favor of a rate structure, looking to the building up of a future profitable load rather than to immediate paying farm business. This is particularly true in Michigan. It was explained by Miss Sarah M. Sheridan, vice-president and sales manager of The Detroit Edison Company, that this company has long had a rate which is the same for the rural customer as for the city customer.

Prof. H. J. Gallagher of Michigan State College, told of the new rural rates of the Consumers Power Company, which, likewise, give the farmer the benefit of the same rates enjoyed by his town relatives.

John G. Learned, vice-president, described the demonstration farm of the Public Service Company of Northern Illinois at Mundelein, Ill.

M. S. Winder, secretary of the American Farm Bureau Federation and chairman of the Committee on the Relation of Electricity to Agriculture, outlined the advancement that has been made in the electrification of farms in Michigan, Wisconsin, Illinois and Indiana. He expressed appreciation of the efforts of central stations to reach the farmers. He pleaded for a program of real cooperation and understanding among all the factors of the rural electrification equation to the end that electric service might as rapidly as possible continue to be extended to end farm drudgery and help to bring to agriculture its share of prosperity and higher living standards.

Developing Appreciation and Possibilities

The symposium on "Developing Appreciation of Possibilities of Electric Light and Power on the Farm," was opened by Miss Sarah M. Sheridan, whose subject was "Farm Electrification from the Standpoint of the Sales Executive."

Miss Sheridan told of the study made by The Detroit Edison Company in the matter of devising cheaper line construction for the farm lines. Under the new method adopted, poles are placed 300 feet apart and aluminum wire is used. The farmers seeking line extensions secure a private right-of-way for the line, which will avoid expensive tree trimming. The company offers to build farm lines at $1,000 a mile with an allowance of $100 for each original customer connected at the time the line is built and allow $60 to the original customers for each additional customer after the line is built. In 1928, under this arrangement, The Detroit Edison Company built more than 300 miles of line and took on 2200 new farm customers.

Miss Sheridan pointed out that the farmer, as a rule, wants electricity for lighting. He has to be sold on the use of it for power purposes.

"We have two necessities," she said, "the necessity of making the business profitable if possible, and the finding of the means of making it profitable. We must influence equipment manufacturers and appliance manufacturers to put on the market good appliances that can be sold at prices within the reach of the farmer."

Professor H. J. Gallagher, of Michigan State College, in charge of farm electrification research and development, told of the demonstration truck being used in Michigan to carry the possibilities of farm electrification to rural communities.

The truck was purchased and equipped with funds provided by The Detroit Edison Company and Consumers Power Company. It is being used throughout agricultural Michigan in the extension work of the Michigan State College.

"The 1928 extension program consisted of 30 demonstrations in 20 different counties with a total attendance of 2275 farmers, an average attendance of 76," Professor Gallagher said. "Demonstrations were also conducted at two farm picnics with an attendance of 10,000; Michigan State College Farmers' Day, 5000 attendance; Ingham County Fair, 2000 attendance; and the Michigan Implement Dealers' Association, 500 attendance.

"Having personally conducted these demonstrations, I am convinced that the first important step in rural electrification is presenting the rural rate schedule to the farmer in such a manner that he thoroughly understands the basic structure and full operation of the rates. The second educational step is presenting the possibilities of farming operations done with the small power unit."

C. V. Sorenson, sales manager, of the Central Indiana Power Company, spoke on "The Fountain (Ind.) County Plan."

The aim of this plan is to give the farmer a proper appreciation of what electricity can do for him. Under its operations the county agent, the county farm bureau, and the two power companies giving service to Fountain County unite to study various problems involved in farm electrification. The general committee in charge of the movement includes farm bureau members, managers of each of the two power companies, and the rural service man of one company, with the county agent as chairman. The chairman of the Indiana Electric Light Association, Rural Service Committee and the project leader of the State agricultural college also meet with the committee. At the meetings there is a discussion of some practical uses of electricity on the farm by the project leader of the agricultural college. A general discussion is held and reports are made on the work of the county. The county agent also organized a series of 16 township meetings.

Mr. Sorenson said: "An indication of what progress may be expected is given by an analysis for 1928 of the accounts of 69 farmers in this territory who are now using electric service. Five are using from 500 to 1000 kw-hr. per year. Seven are using from 1000 to 2000 kw-hr. per year. One used 3000 kw-hr. in 1928, one used 4200 kw-hr.

John H. Flessner, farm service agent of The Detroit Edison Company, told of the exhibits of his company at fairs and various gatherings of farmers. Two tents were needed to house these exhibits at fairs and picnics in 1928. The exhibits included farm equipment powered with electricity and also various appliances for use in the farm home.

Mr. Flessner declared that "eastern Michigan fair managers have come to look upon the farm electrification display as one of the big attractions of their fairs and they welcome it accordingly."

"Individual Demonstrations of Certain Applications as a Means of Developing Appreciation of Electric Service for the Farm," was discussed by E. R. Meacham of the Wisconsin Power and Light Company, Madison, Wis.

"The best rural demonstrations," he said, "do a great deal more than show the machine or how it works. To be of greatest value the demonstration must give to the man who watches it a new conception of how the electric service will satisfy his own conditions and of the advantages it may bring him in convenience, comfort, safety, labor and money. For that reason such a demonstration should be just as complete as to accessories and surroundings as possible, and should be conducted under conditions that are typical for the locality; that is, right on the farm itself. This is what distinguishes a demonstration from an exhibit and makes it such a valuable method of developing an appreciation of the possibilities of electric service."

He described the methods used by his company in demonstrating electric ranges, motors for threshing, filling silos, etc., feed grinders, and so on.

Press Anxious to Help

C. V. Gregory, editor of the *Prairie Farmer,* Chicago, declared that the agricultural press of the country is ready and anxious to do all it can to promote the use of electric power on the farms of the country. Editors of farm papers realize that through the application of electric power to farm operations and to farm homelife, farm efficiency and farm prosperity can be promoted, that higher standards of living can be enjoyed, and that the lot of the farmer and the farmer's family can be made much easier and much happier.

Professor K. L. Hatch of the University of Wisconsin College of Agriculture, Madison, Wis., dealt with the subject "Possibilities of Electric Power on the Farm from the College Extension Service Standpoint." He said in part:

"The advent of power on the farm, particularly in the form of electric current, affords the largest single opportunity for immediate and permanent improvement of living conditions. With power available, running water wherever it is needed, is the next step. With running water available, bathrooms and sewage disposal naturally follow. Then there are electric lights, the power washer, the vacuum cleaner, and electric refrigerator. Given these improvements, the farm home is the equal of any to be found in the city. These are vital reasons why the extension worker should show the possibilities of electric power on the farm."

Truman E. Heinton, of the Agricultural Engineering Department of Purdue University, spoke on "The Rural Service School." He said: "There are now available from experiment stations in the United States results of investigations which, in my opinion, are sufficient to justify the electrification of a majority of the farms in Indiana, Illinois, Michigan and Wisconsin. If the farmers living on this majority of farms were well informed of these experimental results there would be little use of meeting today to discuss means of developing an electrical consciousness on the farm. Since these farmers are not well acquainted with the facts established by investigations, many agencies are now concerned with developing an appreciation of the possibilities of light and power service on the farm. Of greatest importance in this development, in my opinion, are the rural service men of the electric light and power companies."

Mr. E. Van Arsdel, president of Interstate Public Service Company, Indianapolis, Ind., treated the subject from the standpoint of the Electric Light and Power Company.

"A rural electrification consciousness must be developed within the personnel of the power company," said Mr. Arsdel. "It must also be developed among farm leaders, and in order to insure a full measure of future success it is necessary that they view this problem not only from the standpoint of present development, but also with reference to the possibilities of future development in the matter of increased application of electricity to farm operation."

Selling Equipment to the Farmer

The second symposium of the conference was on "Selling Equipment to the Farmer."

L. M. Williams, Commercial Manager of the Wisconsin Power and Light Company, spoke on "Analysis of Territory from Sales Standpoint." He dwelt upon the activities along the line of territorial and market analysis of the Wisconsin Power and Light Company. The territory of the company covers 12,500 square miles. Data from the Wisconsin State Department of Agriculture shows that in this territory dairying is a major pursuit. "Therefore," said Mr. Williams, "we conclude that water pumping equipment, milking machines, feed grinders, silo fillers, electric refrigeration for milk cooling should be of a great deal of assistance to our farmers. We find, too, that egg production is high, and, therefore, electric incubators, brooders, and lighting the hen house should be received favorably by the farmers, especially the farmers' wives."

Mr. Williams declared that the analysis shows the type of crops produced by the farmer and the appropriate time when he receives checks for his produce. "Knowing this, the company is able to time its selling campaigns to interest the farmer when he has money to spend."

"How and What Equipment to Sell to Farmers and Type of Salesman" was discussed by J. R. Campbell, Attica Electric Company, Attica, Indiana. He said: "In selling electric equipment to farmers, we get a direct contact with the small household appliances. Every housewife is more or less familiar with what we have to offer, and there lies the appeal to the husband. On the other hand, the utility salesman must create a desire in the farmer to want equipment that will utilize electric energy in volume—for volume utilization of electricity ultimately means success for both farmer and utility. More or less low pressure salesmanship should be used.

Douglas Dow, farm service advisor of The Detroit Edison Company, handled the subject "Dealer Cooperation." He told of experiments being made by The Detroit Edison Company in the direction of securing efficient and practical equipment for the farmers at the lowest possible cost. "In our opinion," said Mr. Dow, "the function of merchandising is to increase revenue by increasing consumption. We are not interested in making a large profit on the sale of equipment. We are more interested in selling equipment that will stay sold and continue in use without further attention on our part than we are in profiting from the initial sale.

"We found ourselves between the two horns of the old dilemma of doing our own selling or working through the dealers.

"A survey showed there were 185 dealers or electrical contractors selling some or all of the desired equipment. In a few cases we found that the dealers were active. However, in a great majority of cases we found the dealers were backward, apathetic, or seriously hampered by their financial arrangements. In many cases they were trying to sell the wrong kind of equipment or perhaps had tried to sell it, found it didn't work, and decided that this electricity stuff was just another line of hokum and they weren't going to burn their fingers twice. In some cases we found the dealers strongly antagonistic. Certainly we could not depend entirely on the dealer."

Mr. Dow then told of the Detroit Edison Company's experience in marketing equipment and said in conclusion: "As I stated in the beginning, this is an experiment and we do not recommend that any of you try it without giving it very careful consideration and studying the possible difficulties due to unusual conditions in your own territory. If you will wait for another year, we may be able to tell you a great deal more about it. However, if any of you wish to try this or a similar plan we shall be more than glad to give you the benefit of what experience we have had to date and tell you in more detail some of the problems that have come up from time to time in applying this method."

J. C. Myers, president of the National Association of Farm Equipment Manufacturers, spoke on "Selling Equipment to the Farmer from the Standpoint of Equipment Manufacturers," and urged that the merchandising of farm equipment be left in the hands of manufacturers and dealers.

J. F. McCarthy, of the commercial department of the Central Illinois Public Service Company, concluded the symposium on "Selling Equipment to the Farmer" with a paper on "Farm Wiring." Mr. McCarthy said:

"Rural Service Departments are faced with this situation: when the customer installs an adequate wiring system, there is usually very little available money left with which to purchase energy consuming equipment, and when an inadequate wiring installation is made, the customer is dissatisfied with the service, and there is no foundation on which the company can build volume load. They should, therefore, proceed on a quality basis and go as far as possible, and ultimately they will attain the desired objective. It is essential that a liberal payment plan for wiring installations be inaugurated by the companies, and an extensive program developed to educate the farmer to the advantages of an adequate wiring system."

The concluding feature of the conference was a summing up of its papers and discussions by Dr. E. A. White, director of the Committee on Relation of Electricity to Agriculture.

Dr. White emphasized the great strides that have been made within the past several years in taking electric power to the farm and adapting it to the uses of the farmer.

At the opening session Mr. Tom C. Polk, newly appointed secretary-treasurer of the Great Lakes Division, N. E. L. A., who assisted the chairman in organizing the conference, was introduced to the delegates. He welcomed them to Chicago and assured them of the interest of his office in helping in the development of electric service for the farm.

The conference adjourned at noon on Saturday, March 23.

Many of the delegates spent the afternoon at the model farm of the Public Service Company of Northern Illinois at Mundelein, Ill.

National Rural Electric Project Progressing

WIRING is now in progress on the five demonstration farms of the National Rural Electric Project near Washington, according to Geo. W. Kable, director of the undertaking. One installation on the farm of J. W. Jones near Olney, Md., is completed. All of the outdoor wiring on this farm is underground, including a 1200-foot-high tension line from the highway to the transformer pit at the center of distribution.

The five farms of the National Project represent different types of agriculture. One is a dairy farm, one is a fruit farm, another produces eggs, the fourth is a livestock farm, and the last makes a specialty of high-class baby chicks. These are just average farms. Some of the buildings have been standing fifty years and more. All of the farms are in the Sandy Spring community, one of the oldest organized farming sections in the country.

Preliminary work started on the National Project last summer. Under the direction of Mr. L. C. Prickett, farms were selected on which to install demonstration equipment. Since that time these farms have been under close observation and study to learn everything possible of the economic and sociological conditions prior to electrification. These studies are in charge of the project economist and sociologist, Mr. B. B. Powell. In addition to farm business analyses and cost of production studies, they include sociological and fatigue investigations to be used as one method of measuring results of using electricity in the farm home.

The lighting recommendations for the farms have been made by a committee composed of W. C. Brown, of the National Lamp Works; J. J. McLaughlin, of the Westinghouse Lamp Company, and A. D. Bell, of the Edison Lamp Works. The layouts represent the best judgment of these experts as to what constitutes good wiring for the farm.

With the assistance of Miss Eloise Davison of N. E. L. A., the United States Department of Agriculture and Home Economics Department of the University of Maryland, the farm kitchens are being rearranged to accommodate the electrical equipment.

About seventy manufacturers have offered cooperation in equipping the farms. The equipment for the most part will be that which has been found practical for farm use. A few experimental installations of water heaters and certain other pieces of equipment will also be made. Most of the equipment will be loaned to the farmers, subject to purchase.

All of the steps in the development of the project are being recorded photographically. Motion pictures are also being taken to show the transition from hand to power methods.

Careful studies of the present and future needs, as well as opportunities for improving present practice, are being made before equipment is selected and installed.

In addition to the demonstration farms, a program of research has been undertaken. Eventually this is to be the major work of the project.

Tests with the electric plow have been in progress since last fall. Several fields were plowed and planted to grain, and physical and chemical tests of the soil have been made. It is still too early to give results of the method, but they are encouraging enough to warrant continuation of the investigation for another season.

The demonstration farms are located about fifteen miles north of Washington, in the vicinity of Laurel and Olney, Md. The project office is in the Agricultural Building on the campus of the University of Maryland, eight miles north of Washington on U. S. Highway No. 1.

WOMEN'S COMMITTEE

MISS SOPHIA MALICKI, *Chairman* MISS ISABELL DAVIE, *Secretary*

News Letter

BY MRS. THELMA VAN NESS

DURING the last three years, the Women's Committee has sponsored several short courses in electrical household equipment which have been held at various home economics colleges over the country for the benefit of women in the electrical industry who are interested in the increased use of electrical household equipment.

The courses are designed to give information which will aid women in considering the problem from the standpoint of the relationship of good sales to the homemakers' use of our products.

The courses consist of lectures on many phases of homemaking and the subjects which are of especial interest to the students and laboratory work on household equipment. During the course the students are given an opportunity to use the equipment. Time is also given for the viewing of equipment on display by manufacturers that is not in use in the laboratories.

In March, two such short courses were held. One was held at Oklahoma A. & M. College, Stillwater, Okla., which was attended by about 75 women from the Southwest and was sponsored by the Southwestern Geographic Division Women's Committee. An interesting feature of this course was the Public's Open Night, to which were invited the townsfolk to view the exhibit of electrical equipment. The other course was held at Purdue University, Lafayette, Ind., sponsored by the Women's Committee of the Indiana Public Utilities Association. A report of this was given in the May N. E. L. A. BULLETIN.

* * *

The Home Economics Department of Iowa State College, Ames, Iowa, offered during the week of May 27 a course similar to those which it held in 1927 and 1928. Special classes in planning, arranging and equipping home service kitchens were held in answer to many requests.

* * *

Announcement is made of the short course in electrical household equipment for home service directors, to be offered for the third time by Teachers' College, Columbia University, New York, N. Y., from July 29 to Aug. 16, 1929. The morning sessions will be under the direction of Prof. C. J. Lynde and the afternoon meetings will be arranged by the National Electric Light Association. Additional information can be secured by addressing Prof. C. J. Lynde, Teachers' College, Columbia University, New York, N. Y. This course will be preceded by a three weeks' course on gas and gas household equipment.

* * *

More than seventy members of the women's division of the Electric Association of Chicago registered for the short course which was conducted to acquaint them with the origin and application of electricity. The course included a lecture on the generation of electricity, with working model, given at the Electric Club, April 2; a lecture on wiring and lighting, with working model, at the Club, April 9; demonstration of washing machines, ironers and refrigerators at the Electric Shop of the Commonwealth Edison Company, April 16; demonstration of table appliances at the Public Service Company model home in Oak Park, April 23, and a demonstration of electric ranges at the factory of the Edison Electric Appliance Company, April 27. The course was open to all members of the women's division on payment of a $1 registration fee.

* * *

According to *The Looking Glass,* reflecting the activities of the Electrical Women's Round Table of Greater New York, the month of April marked one of the most important events of the electrical year—the annual Appliance Conference of the Metropolitan Home Service Committee, N. E. L. A. Miss Helen Farlow, chairman, worked for months to make this event one of value. The conference was held on one day of each of three weeks instead of three days in succession, as heretofore, at the Home Making Center, Grand Central Palace. Each day's program was filled with interesting subjects from 9.30 a. m., until late in the afternoon.

* * *

The Women's Committee of the Illinois Northern Utilities Company—Miss Edna Decker, chairman—is holding a series of four meetings this year, designed to carry to the women employees a general analysis of gas and electric service in the home. At the first meeting in January, Miss Helen McKinlay of the Edison Lamp Works gave a splendid talk on the fundamentals of lighting for the home and its decorative possibilities. The second meeting, which was an all-day affair, was scheduled for the latter part of April and covered laundry equipment. The lectures and demonstrations were given in the company's general office in Dixon, Ill., by Miss Delphine Lerschen of the Federal Electric Company, Chicago.

* * *

The chairman of the Women's Committee of the Portland, Ore., Electric Power Company, Miss Marguerite Butler, served as hostess for one of the luncheon meetings of the Business and Professional Women's Club in April and was also elected a member of the executive board of the Portland Women's Club.

* * *

Soon accidents will have no terrors for many of the girls of the Portland Electric Power Company as quite a number have taken the Red Cross First Aid Course. Two members of this Women's Committee, Miss Anne Inglis and Miss Betty Taylor, qualified Red Cross lay instructors, not only assist with the Portland classes but have also spent every Friday evening this past winter in Salem, Ore., helping to instruct classes there. Another member, Miss Louise Johnson, is also assisting in the instruction of the Portland classes.

* * *

Miss Mamie Kennedy, South Georgia Power Company, Albany, Ga., was the winner in the Southeastern Division Women's Committee speaking contest for the year 1928-1929. The subject for the contest was "How a Woman Employee Can Help Her Company Merit the Confidence of its Customers." Miss Kennedy was judged the winner in a competition held at the Asheville convention between all speakers who had won State contests. The other State winners were Miss Elsie Lee, Birmingham Electric Company, representing Alabama; Miss Louise Brooks, Florida Power & Light Co., representing Florida, and Miss Cullie Clark, Nashville Railway & Light Co., representing Tennessee.

* * *

The State of Oklahoma Women's Committee was the winner in the Efficiency Contest sponsored by the Southwestern Division Women's Committee.

* * *

Announcement is made of the appointment of Mrs. Jean Roberts, home economics advisor for the Tucson Gas, Electric Light and Power Company, as the first State chairman of the Women's Committee in Arizona.

* * *

The 1929 Essay Contest of the Women's Committee, Public Relations Section, Pacific Coast Electrical Association, has for its subject, "The Women's Committee—An Asset to the Utility." There are cash prizes and the contest is open to each member of the Women's Committee in public utilities affiliated with the Pacific Coast Electrical Association. Mrs. Ruth E. Creveling is chairman of this group.

* * *

Mrs. Nell Laws, chairman of the Northwest Division Committee, reports a very interesting and successful midyear meeting at Walla Walla, Wash. It was decided to recommend to Mr. W. H. Ude, chairman, Public Relations Section, the subject "Pleasing Mr. and Mrs. Public" for the 1929 Essay Contest to be sponsored jointly by the Women's Committee and the Committee on Employees' Relations with the Public. Discussion at this meeting brought out the following general program suggestions: (1) From time to time it has been found wise to review the aims and purposes of the Women's Committee; (2) Regular electrical current event topics by the members and short talks on "Why I Find My Job Interesting" have been found to be valuable additions to programs; (3) Talks by local representatives of "Better Business Bureaus;" (4) Speakers from local Women's Committee of Banking Institute; (5) Book reviews on suitable books by representatives from local public library.

One of the most interesting reports given at this meeting was that of the Bellingham, Wash., committee, Puget Sound Power & Light Company, stating that executives from large local industries have been asked to speak to the girls, explaining the particular application of power in their own plants. A series of such meetings has been planned.

The Eastern Oregon Light and Power Company Women's Committee, through Miss Irma Thiessen, chairman, reported a telephone canvass of all range customers of the company to learn whether the ranges and service were satisfactory. In only 11 out of approximately 300 calls were any grievances found and these were adjusted. This committee holds an "at home" in the company offices, both in LaGrande and Baker, once a month when the customers and other friends of the company are invited to the office and appliances are demonstrated. Refreshments prepared at the demonstration are served. These "at homes" have become an institution and have made many friends for the company.

* * *

Miss Thelma Kelly, chairman of the Pacific Power and Light Company Women's Committee, recently accepted an invitation from the Federated Clubs of Moro, Ore., to give a talk and demonstration on electric ranges, refrigerators and other appliances. After her talk which was very well received, Miss Kelly served electrically frozen dessert to 80 persons.

* * *

The Women's Committee of the Northwestern Electric Company, Portland, Ore., of which Mrs. A. W. Angell is chairman, is doing some very progressive work. A number of range demonstrations have been given and a program was arranged by the committee for all Portland Parent Teachers' Associations at which the company illuminating engineer gave a talk.

* * *

The Women's Committee of the Appalachian Electric Power Company at Charleston, W. Va., was hostess at a benefit bridge held at the Women's Club recently. Charleston's committee is also responsible for editing a new paper entitled *Elec's Hi-Lites*, giving the details of each meeting, the program for the coming month, new recipes and anything of interest to the women employees.

* * *

The Idaho Power Company Women's Committee—through Miss Gertrude McDevitt, chairman—reports a cooking school soon to be conducted for the whole committee. This committee is very active in public speaking classes. Mrs. McDevitt appeared before the Century Club of Nampa, Idaho, recently and the Whitney Progress Club of Whitney, Idaho.

* * *

The Portland Electric Power Company is holding a series of Women's Committee meetings in which the girls themselves take a very active part. At one meeting, the attendance of which was 103, fifteen women took part in the program, and at a subsequent meeting of 120 women, eighteen women made up the program.

* * *

The girls of the Women's Committee, Wheeling (West Virginia) Electric Company, have been asked to help with the Associated Charity drive in that city.

* * *

Miss Margaret Schneider, chairman of the Wheeling Electric Company Women's Committee, reports a safety meeting held recently at Wheeling, W. Va. The girls of the Bellaire, Moundsville, Dillonvale and Barnesville offices were guests of the Wheeling organization. Mr. H. E. Crain, safety director, gave a talk on safety and public relations, using as a subject "Do We?" The men of the organization put on a little skit entitled a "Radio Review" and a motion picture entitled "The Verdict" completed the program. The committee in charge of the program for the day was Miss Minnie Seevers, chairman, and Misses Nellie Niebur and Verna Evans.

* * *

Miss Susie Pyott, chairman Women's Committee, Appalachian Electric Power Company at Bluefield, W. Va., reports that her committee is planning to take a three months' course in safety and first aid.

* * *

At Fairmont, W. Va., the Monongahela West Penn Public Service Company Women's Committee has been holding some very interesting meetings. At one meeting the wives of the executives were in charge of the social hour after the meeting.

The March number of the Grays Harbor Railway and Light Company magazine, Aberdeen, Wash., was edited by the Women's Committee, the girls having complete charge of all details of this activity.

* * *

In connection with an educational exhibit sponsored by the Illinois Power Company during the convention of the Illinois State Electric, Gas and Electric Railway Association in March, the Women's Committee of the Illinois Power Company assisted Mrs. Edith Clift Meyers in serving waffles and coffee. Mrs. Meyers is director of home service for Landers, Frary and Clark. Invitations were mailed to all members of the Springfield Women's Club, inviting them to visit the display, and waffles and coffee were also served to this group.

* * *

Miss Angie L. Watts, Illinois State chairman, reports a very successful Women's Committee meeting in connection with this convention.

* * *

The Women's Section, Empire State Gas and Electric Association held a splendid two-day meeting at Ithaca, N. Y., May 2 and 3. Miss Helen Smith, Rochester Gas and Electric Company, Rochester, N. Y., is chairman of this section.

MAGAZINE ARTICLES

BELOW IS A LIST of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

Good Housekeeping—May
- The Hot Water Supply—T. L. Henderson.

Woman's Home Companion—May
- All in the Day's Mail—Anna Steese Richardson.
- Creative Housekeeping — Earnest Elmo Calkins.

McCall's Magazine—May

In order to eliminate curves millions of dollars are spent each year in this country by railroads and overweight girls.

SPECIAL COMMITTEES

More Light on Light*

THE electrical industry has devoted much thought and care to making electric lighting as efficient as possible. The ideal of highest efficiency can only be attained when lamps, wiring, and central station service are at their best. If the lamps are inefficient, the wiring inadequate or the service voltage low, the desired efficiency is not realized.

Highest practicable efficiency for incandescent lamps is assured through a comprehensive system of testing which has this as part of its object.

Building and house wiring is very generally inadequate. When fully loaded serious voltage drops are likely to be encountered between the service entrance and lamp sockets as a result of which the public loses the advantage of the full lighting to which it is entitled and the unit cost of the illumination which it does obtain is rendered higher.

When, as sometimes occurs, the central station voltage at the service entrance is lower than that intended the public suffers further deprivation in its lighting and the central station sells less current than it should.

The chart in Fig. 1 shows the well known relation between the light output of incandescent lamps and voltage. It also shows the relation of lamp life to voltage. Although with lower voltages the lamp life increases rapidly the saving in lamp renewals by no means compensates for the reduction in light output and efficiency.

Another cause of inefficient lighting which has been found to be not uncommon is a tendency for dealers in some sections to sell lamps of higher voltage rating than that of the service. In one mid-western city in which this subject has been studied recently it was found that practically all the lamp agents were selling 115-volt lamps although the company operated at 110 volts and itself sold 110-volt lamps. These dealer lamps were found to come largely from nearby cities in which 115 volts were standard. Wherever the public obtained lamps from dealers their lighting results suffered. In the same city 1500 voltage readings at service entrances during lighting hours showed the operating voltage to be about 110 volts, not more than 1 per cent being either above 115 volts or below 105 volts.

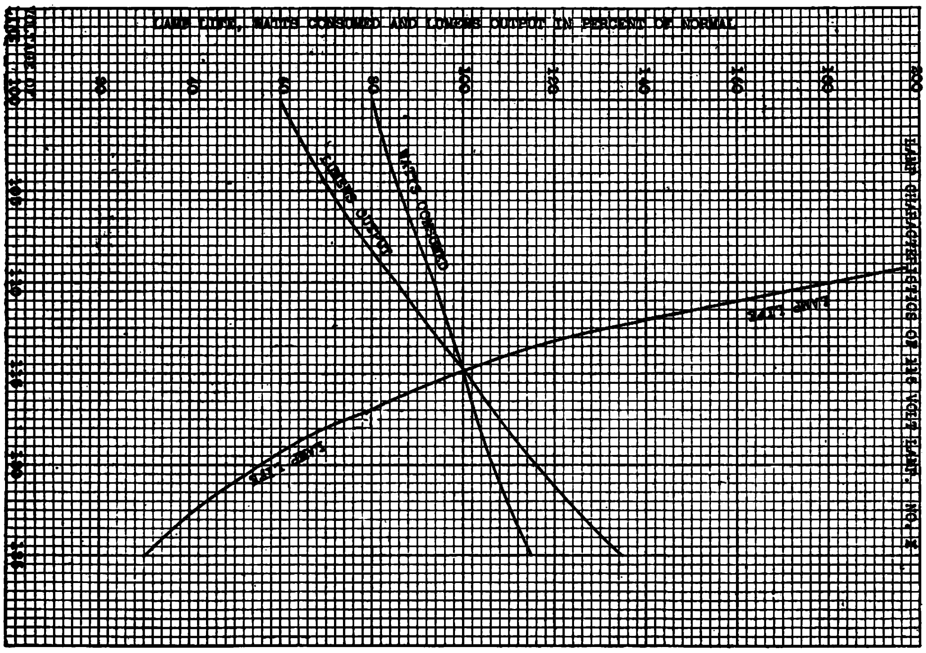

Fig. 1

Relation between light output of incandescent lamps and voltage

In another city in the Mid-West it was found that the voltage at service entrance during lighting hours averaged somewhat below the standard operating voltage. In this city the voltages of lamps in the stocks of dealers were found to be various; none of them, however, being as low as the actual operating voltage and some of them being either five or ten volts higher. In this case, due to the low central station voltage the conditions were aggravated with the result that losses to the public and to the central station were of a serious order. The chart in Fig. 2 indicates the reduction in wattage brought about by low voltage applied to the lamp.

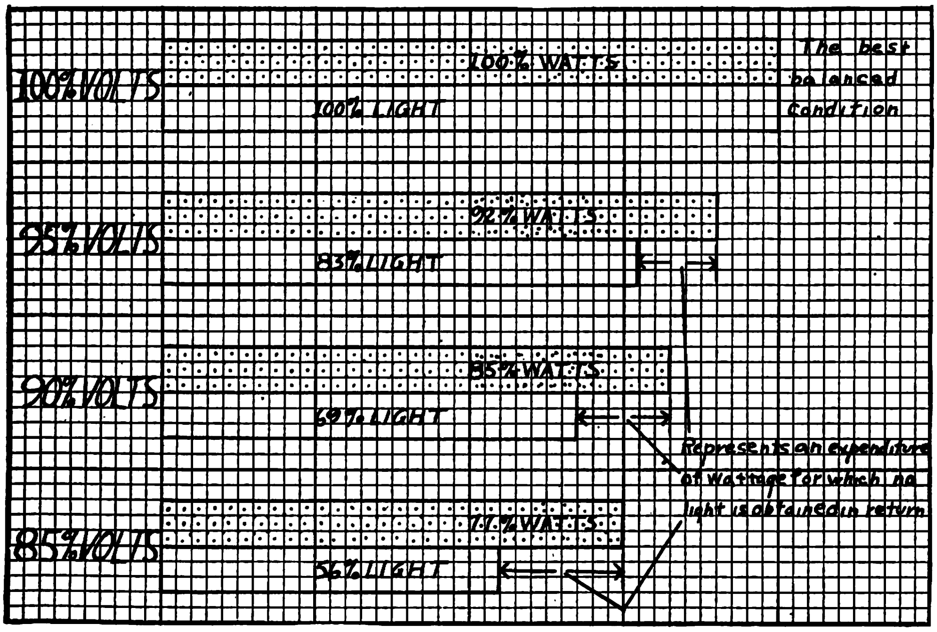

Fig. 2

Wattage reduction brought about by low voltage applied to the lamp

We need more light on our lighting load, to impress upon the central stations the importance of knowing their voltage and of taking their voltage data at the lamp socket rather than at the service entrance. Most utilities make allowance for voltage drop, but none of them make enough allowance.

Whatever may be the cause of low voltage operation of lamps it ought to be remedied.

---

WHAT OCCURRED LAST MONTH

Agricultural

The State Corporation Commission of Virginia is expected soon to promulgate rules and regulations for electric utilities which will include a plan for further extension of electric lines into rural sections. Governor Byrd recently appointed a special committee to study a farm electrification plan for Virginia and a subcommittee has also been working on the rule which the State Corporation Commission is to adopt.

* * *

Coal

A publication of the World Power Conference, issued in London, reveals a drop of 400,000,000 tons annually in the use of coal and a world movement toward electrification. The use of oil, of water power resources and the scientific combustion of low grade fuels, are causes of the decline in the use of coal.

* * *

Consolidations

With the organization of the International Hydro-Electric System as a subsidiary of the International Paper and Power Company, the Canadian Hydro-Electric Corporation and the New England Power Association are under one control.

* * *

It was announced on May 21 that the Associated Gas and Electric interests have acquired all of the public utility operating properties formerly controlled by E. L. Phillips and his associates in up-state New York.

* * *

Merger of eleven Tennessee electric and gas concerns owned by the Doherty interests into the Tennessee Central Service Company is under way, according to dispatches from Tennessee.

* * *

Purchase of several electric properties in southern Alabama by the General Water Works and Electric Corporation of Delaware, whose offices are in New York, is announced. The property serves about twenty small communities.

* * *

Earnings of Public Utilities

Gross earnings of public utility enterprises in March, exclusive of telephone and telegraph companies, as reported to the Department of Commerce by ninety-five companies or systems operating gas, electric light, heat, power, traction and water services and comprising practically all of the important organizations in the United States, were $195,000,000, as compared with $194,000,000 in February, and $187,726,994 in March, 1928, according to a Department of Commerce announcement. Net earnings for March are given at $85,000,000, as compared with $72,811,146 in March, 1928.

* * *

Federal Trade Commission Investigation

On May 2, James Pollard, secretary of the Light and Power Association of California, testified before the Federal Trade Commission concerning activities of his association, which he declared has spent $100,000 a year for the past two years. A. E. Wishon, secretary of the association until February, 1927, was also a witness.

* * *

On May 10, witnesses before the Federal Trade Commission were William Lavarre and Harold Hall, who told of loans of $870,000 received by them from the International Paper and Power Company for financing the purchase of the Augusta, Ga., *Chronicle,* the Columbia, S. C., *Record,* the Spartanburg, S. C., *Herald,* and the Spartanburg, S. C., *Journal.* They also testified concerning negotiations for the purchase of other papers which did not come to any result. Mr. Lavarre stated that the International Paper Company had made no attempts to influence the editorial policies of his newspapers, nor had it any connection whatever with the editorial management of the Hall-Lavarre publications.

* * *

On May 11, Samuel S. Wyer of Columbus, Ohio, was the only witness before the commission. Mr. Wyer told of professional surveys and analyses made by him of various problems of interest to public utilities. These included studies which he made of the Ontario Hydro, Muscle Shoals, and other projects. Mr. Wyer's survey of the Ontario Hydro was issued as a document of the Smithsonian Institution and this fact was the subject of questioning by Judge Healy for the commission. Much of the material in the survey was gained from a study of findings by a Canadian Royal Commission, Mr. Wyer testified. He said that his more recent publications have been issued under the auspices of the Fuel-Power-Transportation and Educational Foundation of the Chamber of Commerce of Ohio. These relate to the fertilizer problem, the St. Lawrence waterway and other matters.

* * *

On May 15, the Federal Trade Commission sent its Fourteenth Interim Report on the investigation to the Senate. This tells of examination by accountants of accounts of operating companies in two important holding company groups, of the sending of accountants to another holding company, and of field work on the relations between utility companies and service organizations completed at the office of one of the important management groups.

* * *

On May 15, witnesses before the commission were Frank E. Gannett of Rochester, N. Y., publisher of a chain of seventeen newspapers; S. E. Thomason of the Bryan-Thomason Newspapers, Inc., and Edwin Jeffries, president and business manager of the Greensboro, N. C., *News.* The testimony of these witnesses was concerning financing of newspaper purchases by the International Paper and Power Company. Mr. Gannett stated that the International had no influence whatever over the editorial or news policies of his papers, and Mr. Thomason testified to the same effect. Mr. Gannett also testified concerning his complete repayment of the money lent him by the International. Mr. Jeffries was examined briefly concerning efforts of William Lavarre and Harold Hall to acquire his paper, these efforts leading to no result.

* * *

On May 16, the following four witnesses were examined by the Federal Trade Commission: Richard Grozier, owner and publisher of the Boston *Post*; Frank D. Comerford, president of the New England Power Association and vice-president of the International Paper and Power Company; Channing Cox, former governor of Massachusetts and a director of the Boston *Herald* and *Traveler,* and N. C. Head, assistant to the president of the International Paper Company and vice-president of the International Paper and Power Company.

Mr. Grozier told of negotiations by Charles O'Malley, advertising agent of Boston, with C. B. Carberry, managing editor of the *Post,* concerning purchase of the *Post.* Mr. Carberry declared that Mr. O'Malley indicated that he was representing Insull interests and said he was authorized to offer $20,000,000 for the *Post.* Mr. Carberry, according to Mr. Grozier, did not take the offer seriously and Mr. Grozier looked upon the matter in the same way.

Messrs. Comerford, Cox and Head testified concerning the financial interests of the International Paper and Power Company in newspapers.

* * *

On May 17, Charles O'Malley was a witness before the commission. He denied emphatically that he had ever claimed to represent Insull interests in his negotiations concerning the Boston *Post.* His negotiation had been the result of an inquiry by a stranger who claimed to represent financial interests in New York and Chicago, he declared.

Other witnesses at the hearing were R. B. Chandler, publisher of the Mobile, Ala., *Press,* which began publication last April; T. M. Stevens, a Mobile attorney, and D. P. Bestor, Jr., president of the First National Bank of Mobile. These witnesses testified concerning establishment of this paper and declared that there was no connection between its establishment and the Alabama Power Company or other utilities.

* * *

On May 20 and 21, Senator Norris delivered a long address in the Senate, going exhaustively into the evidence presented at hearings of the Federal Trade Commission and displaying his usual opposition to the course and conduct of the utilities.

* * *

On May 22, Senator Walsh of Montana offered a resolution calling the attention of the Attorney-General to testimony before the Trade Commission and sworn statements to the Post Office Department concerning ownership, said to be in conflict with the testimony before the commission, and asking the Attorney-General "to take such action as may be appropriate."

* * *

On May 23, Thomas M. Stevens, attorney, of Mobile, Ala., testified before the Commission concerning the founding of the *Mobile Press* which began publication last April. He denied charges that power interests were financially interested in the *Press.* He declared that the paper was started with no direct or indirect affiliation with power interests, although power officials, because of continued unfair attacks by Mobile papers, had conferred concerning establishment of a new paper.

* * *

On May 24, Senator Walsh of Montana, introduced a resolution calling for an investigation by the Federal Trade Commission of all industrial and commercial combines having outstanding securities in excess of $20,000,000 which have been effected during the past four years.

* * *

On May 28, the Commission announced that Colonel Ira C. Copley, owner of newspapers in California and Illinois, who requested that he be permitted to testify, would appear as a witness on June 13.

* * *

Hydro-Electric

The Federal Power Commission on April 26 announced indefinite suspension of its order, approved Feb. 28, which would have brought under control of the commission security-issues of licensees and their subsidiaries. This suspended order was to be effective if the utility was "developing, transmitting, distributing or using power in a State which has not authorized and empowered a commission or other agency, or agencies, within such State to regulate and control the amount or character of securities to be issued by such licensees," or if any part of the power entered interstate commerce and reached a State which has not provided such regulatory authority. On April 29, Secretary Good, chairman of the commission, said that the commission expects to study the situation more carefully and see whether the public is properly served under the present system.

* * *

On April 29, the Federal Power Commission announced that nine applications for permits for licenses had been filed during the month ended April 25, bringing the total number of applications received since the creation of the commission to 982.

* * *

The Private Bills Committee of the Canadian House of Commons has refused a request from the Dexter P. Cooper Company for an extension of time for two years in which to commence its proposed tidal power project on Passamaquoddy Bay, between the Province of New Brunswick and the State of Maine.

* * *

A second 25,000 horsepower generator has been started in the Bryson, Quebec, hydro-electric plant of the Gatineau Power Company, a subsidiary of the Canadian Hydro-Electric Corporation. The total capacity of the plant is 75,000 horsepower.

* * *

A dispatch from Erwin, Tenn., tells of a $1,000,000 hydro-electric project for the Nolichucky River, which is to supply Erwin with electric current.

* * *

On May 6, Commissioner of Reclamation Mead presented to Secretary of Interior Wilbur the plan of an economic survey of undertakings of the Reclamation Bureau, which the Bureau will make this summer in order to determine the present status of its activities. The plan was approved by Secretary Wilbur.

* * *

The Bracken Government, in power in the Province of Manitoba, has been given a clean bill of health by the commission which investigated the charges of corruption against the Administration in connection with the lease of the Seven Sisters Falls to a private company.

* * *

The California Legislature adjourned without adopting bills calling for construction of works involved in the $124,000,000 coordinated water program, which includes irrigation, hydroelectric and flood-control projects. The proposed $30,000,000 dam at Kennett, on the Sacramento River, is one of the features of this program. The Legislature did authorize expenditure of $450,000 for engineering surveys during the next two years in connection with the proposed program.

* * *

The New England Power Association has let a contract for a huge earthern dam at Monroe, New Hampshire, upon which work will begin within the next few weeks. The dam is one unit of a $40,000,000 project in that section. It will create a lake eight miles long and, it is estimated, will develop 200,000 horse-power.

* * *

Production of Electricity

According to the United States Geological Survey, total production of electricity in the first quarter of 1929 was 23,633,000 kw-hr., an increase of 11 per cent over the output for the same period in 1928. Quantities given are based on the operation of all power plants producing 10,000 kw-hr. or more per month, engaged in generating electricity for public use.

* * *

Railway Electrification

A bill has been introduced in the Illinois State Senate providing for a legislative study of electrification of all the steam railway terminals in Chicago.

* * *

Rates

Morris Llewellyn Cooke, director of the Pennsylvania Giant Power Survey under former Governor Pinchot, has sent an open letter to the Federal Power Commission which is critical of the present rate structures of electric utilities, particularly contending that the domestic consumer pays too great a percentage of the total utility income.

* * *

Directors of the Worcester, Mass., Electric Light Company, at their first meeting since ownership of the company passed to the New England Power Association, voted to withdraw from the Worcester rate case.

* * *

The Public Service Commission of Oregon announces that the investigation into the power and light rates prevailing in Portland will be undertaken before any study is made of the request for a 10-cent street car fare. An investigation concerning valuation on which rates in Portland are based is also being made under the direction of the Portland City Council.

* * *

On May 17, the Philadelphia Electric Company filed with the Public Service Commission of Pennsylvania a new schedule of rates under which residential consumers of electricity in Philadelphia and Delaware County will save about $900,000 a year. The new rates are to go into effect on June 15.

* * *

The Public Service Commission in Maryland is investigating rates prevailing in a number of towns of the Eastern Shore district.

* * *

The California Railroad Commission has asked sixteen California utilities to appear before it in June to show cause for the rate of earnings in 1928, the commission claiming that these are too high.

* * *

On May 27, the Public Service Commission of Maryland began hearings on rates for gas and electricity in Baltimore. The People's Counsel of the City of Baltimore announced his intentions to seek a very large reduction with the greater part of it benefiting the residential consumers.

* * *

Regulation

A bill proposing a tax not over one-fourth of 1 per cent of the gross revenues of public utilities for the support of the Public Service Commission of Missouri has been postponed indefinitely by a vote of the Missouri House.

* * *

On May 8, Senator Couzens, chairman of the Senate Committee on Interstate Commerce, in opening hearings on a bill introduced by himself to create a Federal Communications Commission to regulate radio, telephone, telegraph and cables, said he will introduce an amendment to the bill proposing Federal control of utilities engaged in interstate commerce.

* * *

The last session of the New Hampshire Legislature enacted several laws increasing the power of the Public Service Commission in its regulation of electric utilities. One law gives the commission jurisdiction over contracts between one utility and another. The commission is also authorized to limit, as well as permit, export of current from the State. Limitations on security issues are also provided for, and provision is made for the appearance of the attorney-general before the commission in matters where public interest requires, and permitting him to employ experts and assistants.

* * *

The Governor of Michigan has signed the amended Rushton Bill which requires gas and electric utilities to secure a certificate of convenience and necessity in certain cases, but excludes municipal corporations from the provisions of the act.

* * *

The Michigan Senate has passed a bill providing for the incorporation by any two or more cities, villages or townships, or any combination or parts of these, of a metropolitan district, or districts, comprising territory within their limits for the purpose of acquiring, owning and operating, either within or without their limits, parks or public utilities for supplying sewage disposal drainage, water, light, power or transportation.

* * *

Before its recent adjournment the Nebraska Legislature passed a bill permitting municipal utility plants to extend service fifteen miles beyond city limits where contracts have been secured that show a gross profit of 15 per cent. The bill has been signed by the Governor. The Governor has also signed a bill which permits urban and rural communities to create hydro-electric distribution districts.

* * *

A movement initiated by the Legislative Committee of the Maine State Grange seeks to invoke a referendum on the bill by which the last session of the Maine Legislature granted a restricted right of eminent domain to electric companies with respect to their transmission lines.

* * *

The Joint Committee on Rules of the Massachusetts Legislature has recommended passage of a resolution calling for investigation of activities of power interests in the State by a special commission of one Senator, three Representatives and three persons to be appointed by the Governor. The resolution proposes an appropriation of $25,000.

* * *

A bill has been introduced in the Florida Legislature to create a State Utilities Commission, which would have jurisdiction over electric companies, rates, etc. It is proposed that the present Railroad Commission be consolidated with this Utilities Commission. The bill calls for an excise tax from which municipal utilities would be exempt.

* * *

The special session of the Texas Legislature has acted adversely on the proposal to create a State Public Utilities Commission. This is in accord with the Legislature's attitude at the regular session. Another special session is to be called in June and it is reported that Governor Moody may once more lay the public utility measure before the Legislature.

Public Policy Report

(*Continued from page* 338)

the furnishing of data to schools and colleges come relationships with those who use it. Such contacts are proper, natural, necessary and desirable for all concerned, if informational service is to be efficient. The relationship necessitates a high standard on both sides. It is inconceivable that the industry should refuse any reasonable request for information helpful to those engaged in public instruction. It is improbable that teachers in our schools or instructors in our universities would accept for their use any material which is not truthful, accurate and valuable, even if an attempt were made to foist the opposite character upon them. The whole question of cooperation and relationship between education on the one hand and commerce, business and industry on the other is one of common concern, by no means confined to the utilities. It involves practically every great American industry. The methods must be finally determined by the educational authorities. The electric industry has always cooperated with them in the fullest degree. It desires to continue to do so. It hopes that in the near future a more definite basis for that relationship will be worked out and declared by those responsible for educational methods. The industry expects to conform with their final policies.

The electrical industry has long been recognized as a leader in research. In the laboratories of the electrical manufacturers and in the field experimentation of the operating companies there has been ceaseless search for new truths, added applications and further harnessing of this great instrument for the benefit of mankind. This effort has been rich in rewards, shared not alone by the electric industry and its customers, but aiding other industries and reaching into the lives of all the people. With the formulation of the great program for stimulation of pure science research, under the direction of the National Research Council, the National Electric Light Association, in behalf of the electric light and power companies, is glad to announce its full participation in the movement. The National Electric Light Association thus confirms its confidence in the body of men devoting their lives to research who have already given so much and who have in their hands the unfolding of a richer future.

Ours is a responsibility for bringing to the American people the best electric service at lowest possible cost which human capabilities can accomplish. To this end the Association and its members rededicate themselves.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Electrical Domestic Appliances on the Farms

TWO-THIRDS of the electrified farms have washing machines according to an analysis of a survey recently completed by *Woman's World.* This is a higher percentage than that shown for the urban homes surveyed by the same publication and represents the response of the farmer to the solution of one of the most irksome tasks of the housewife.

Five per cent of the farms have electric refrigerators—the same ratio as urban homes—while 10 per cent have electric ranges, as against only 7 per cent in the towns studied.

The complete list of domestic appliances in the 529 farms which reports the use of electricity is as follows:

Washing machines, 350 or 66 per cent.
Vacuum cleaners, 220 or 42 per cent.
Curling irons, 197 or 37 per cent.
Toasters, 185 or 35 per cent.
Fans, 72 or 14 per cent.
Electric percolators, 66 or 13 per cent.
Electric grills, 53 or 10 per cent.
Electric ranges, 52 or 10 per cent.
Heaters, 50 or 9 per cent.
Electric refrigerators, 24 or 5 per cent.
Electric fireless cookers, 12 or 12½ per cent.

Of the appliances purchased, 11 per cent were procured from the local light and power companies, while 47 per cent were bought from dealers in the nearest home town.

A further item of interest is the reporting of 1189 farms with radio sets, of which 94 or 8 per cent are operated from the electric light socket.

Electricity to Aid Tunnel Building

ELECTRICITY will play a vital part in the construction of the gigantic new tunnel which will be built for the purpose of adding to New York City's water supply. This tunnel will be 20.2 miles long, 17 feet in diameter and will be at a depth of about 500 feet below sea level.

Compressed air for drills and shovels will be furnished by synchronous, motor-driven compressors of 400 horsepower. As the muck is removed it will be hauled through the tunnels to hoists by storage battery mine locomotives, of which there will be 62. Sixteen electric mine hoists will carry it to the surface.

At present New York City uses 875 million gallons of water per day. The distributing system has long been recognized as inadequate for future needs and even today is not large enough to maintain suitable pressure in the Boroughs of Brooklyn and Queens.

We Point with Pride

THE first commercial incandescent lamp consumed about 100 watts and was rated to give 16 candle power horizontally, the equivalent to about 170 lumens. It blackened considerably during its life, the average amount of light throughout life being about 65 per cent of initial. It sold for $1.25 and was considered one of the marvels of the age.

The present average lamp is rated at 690 lumens (the equivalent of about 69 candle power), its average lumens throughout life being 93 per cent of initial. It thus gives over five times the amount of light given by the lamp of 1881 and consumes about 40 per cent less current. Its list price is 20 cents, less than one-sixth that of the 1881 lamp.

Inasmuch as current costs about one-third of what it did in the early days of electric lighting, it can now be said that, roughly speaking, five times the amount of light is obtained for about 20 per cent of the cost or the same amount of illumination can be obtained for about 4 per cent of the cost.

This is a record of improvement of which the light and power industry can be justly proud.

Electrically Operated Razor

ELECTRICALLY operated apparatus, such as hair clippers, vibrators, sterilizing machines and instruments for dressing women's hair have been used for some years in barber shops and beauty parlors. Now we are told by Colonel Jacob Schick, of the Magazine Repeating Razor Company, that an electrically operated bladeless razor has been perfected.

This new razor is based on a combination of shearing and nipping by rapid vibration at a very high speed of the inner of two parallel, slotted, shearing plates. According to the announcement, "the apparatus is only slightly larger than the safety razors now in general use and can be attached to an ordinary lighting socket. . . . The inner plate vibrates 7200 times a minute and nips off the hair as it falls in through the outer slotted plate.

"No matter how hard the bladeless razor is pressed, it is impossible to cut or injure the skin and it can be safely operated by a child without any possibility of injury."

Hotel Guests Undisturbed

AN extension to the Chalfonte-Haddon Hall Hotel in Atlantic City was recently erected, swiftly and noiselessly, without disturbing the guests of either hotel, or the residents of the cottages in the neighborhood. This achievement, free from the nerve-racking din of riveting hammers, was made possible by the use of electric arc welding. The actual structural work was completed in a month's time.

The time is rapidly approaching when steel construction will cause no more annoyance than the laying of a brick wall.

Moon Comes In

"PUSH button and moon comes into room." This sentence is a translation of what a surprised Eskimo said when he first saw the electric light. The incandescent lamp, according to the annual reports of the Royal Canadian mounted Police, is the latest toy of the "Children of Twilight."

Modern inventions travel to the far corners of the earth. Many of the Eskimos have heard the phonograph, a few have heard the radio and there are some that even have seen the airplane. Now, to their amazement, here is a light that needs no oil, a light that burns steadily, an ideal accessory for the long twilight; provided, of course, that there is always electricity to make the lamp burn.

Making Hay Without Sunshine

MAKING hay without sunshine is one of the 200 uses of electricity developed by Borlase Matthews, pioneer in the application of electricty to the needs of agriculture, according to an Associated Press Dispatch from London.

"He has an 'electric farm' of 600 acres in Sussex and is developing a scheme for electrification of rural Lincolnshire, over an area of 1280 square miles, with a capital of $5,000,000. He has received a special order from the electricity commission for his project.

"Matthews is convinced that farmers in England are keen to develop the use of electricity, examples of which he quotes as electric threshing, electric plowing, electric churning and use of ultra-violet rays for poultry and pigs."

THE REVIEWING STAND

Outline of Fundamentals of System Interconnection

Serial report, Electrical Apparatus Committee, Engineering National Section, N. E. L. A., Publication No. 289-60, 12pp. Price 15 cents; to members, 10 cents.

PROBABLY no single engineering feature of the industry is of so much interest to utility executives as the subject of interconnection. Certainly in no other single way can such sweeping benefits and signal economies be effected with minimum capital expenditures as by a sane and reasonable process of neighborly cooperation.

While the report does not attempt a universal solution, it does clearly and comprehensively state the problems involved in interconnection, outlines the methods of attack and should serve as a valuable guide to procedure in approaching any interconnection project. The report does not blithely dismiss the difficulties that are bound to arise. It does, however, very clearly indicate that they are not different in character from the problems which are met and solved internally in any of our large systems.

It is suggested in the report that it is possible to operate utilities under separate ownership to effect the same economies that would result were the ownership common. Granted that both parties to an interconnection must benefit, and that the benefits may be either in dollars or "in kind," and granted further that both parties are approaching the problem with openness of mind, there would seem to be no essential difficulty in making such common adjustments as are necessary to contractual understanding. Executives will appreciate that a meeting of minds as between nieghboring utilities need not be any more difficult than is mutual understanding and agreement between the varied interests internal to each.

Engineers will welcome this report as an index and outline of procedure. Executives will find it an excellent summary of the questions they may wish to ask of their engineers.—*J. C. P.*

Treatment of Feed Water

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-53, 20pp., 6 illustrations, 10 tables. Price, 30 cents; to members, 20 cents.

A SURVEY of the central station industry to determine the general practice in the treatment of feed water and the results obtained by the various methods is the basis of this report. Forty statements by operating companies are included which describe various methods of treatment of feed water. The use of evaporators is reported by 24 companies, chemical treatment is used by 9 others, 3 companies use Zeolite and 4 report no treatment.

The results of various tests are set forth in tabular form. Statements by several manufacturers are included. Recent Zeolite installations of high-pressure boilers, typical Permutit continuous boiler blow-off installations and acid and phosphate feed installations also are given in tabular form.—*E. S. B.*

Filing Corporate Documents

Serial report, General Records Committee, Accounting National Section, N. E. L. A. Publication No. 289-63, 8pp. Price 15 cents; to members, 10 cents.

THE problem of keeping information of a corporate nature safely, properly indexed and readily available is one that faces every central station company. How this can be done most efficiently is explained in this report.

The need for a "Department of Documents" for filing the companies' numerous and important documents, such as franchises, right-of-way, licenses, permits, etc., is briefly outlined. The how-to-do deals with such subjects as: Selection of filing equipment, assignment of document numbers, indexing of documents, the tickler card system, routine payments, chattel mortgages and receipt for loan documents.—*E. S. B.*

Health Promotion in the Public Utility Industry—Its Necessity and Importance

Serial report, Industrial Relations Committee, Public Relations National Section, N. E. L. A. Publication No. 289-56, 16pp. Price, 15 cents; to members, 10 cents.

BECAUSE the health of all the staff of an industry is extremely important to the industry's success, this report is of interest to all public utilities. "Aside from humanitarian reasons," states the report, "it is of particular interest to the public utility to help its employees lengthen their lives."

Practical suggestions on "How the Medical Department Can Be a Factor in the Reduction of Absenteeism from Work" are given under Appendix 1. A second appendix deals with the "Opportunities Which All Companies Have to Control Absenteeism by Care in Ventilation."

The matter of organized effort to care for the health of employees is one which no industry executive can afford to overlook. Sickness, the report states, is responsible for approximately 8 days' absence per employee per year.

Attention also is called to other reports of N. E. L. A. committees in which references are made to the problem of health in the public utility industry.—*E. S. B.*

Diesel Engine Power Costs

Serial report, General Power Committee, Commercial National Section, N. E. L. A., Publication No. 289-38, 7pp. Price 25 cents; to members, 15 cents.

THE new report on Diesel Engine Power Costs is a worthy supplement to the original report of the Power Committee which has been found so useful by power engineers and salesmen.

This report is purely a supplement and is intended to be used with the original report, as no data has been repeated; all information being on new stations or on subsequent operation of older stations covered in the original report.

It is remarkable how closely the costs listed in the later report check with those given in the original. The general setup of material has been somewhat changed, so that it is now possible to obtain segregated costs on many individual items.

The plants covered include small units which would ordinarily be found in industrial applications, and also the larger units designed for central station use. Mechanical drive units are also covered in detail.

The figures shown in the report are truly representative of the various types of oil engine installations which are apt to be encountered by the power engineer.

The costs are based on a detailed study of a large number of plants actually in operation, and for this reason the report forms a background which is practically essential to the successful power engineer or salesman.—*A. B. M.*

New Developments in Auxiliary Testing Equipment

Serial report, Meter Committee, Engineering National Section, N. E. L. A. Publication No. 289-57, 40pp., 80 illustrations, 1 table. Price 55 cents; to members, 35 cents.

THIS report, describing further new developments of auxiliary equipment essential to the Meter Department, supplements previous material of this nature prepared by the Meter Committee and published in the "Handbook for Electrical Metermen" and in other serial reports.

In addition to illustrating and describing available new material from various manufacturers, this report con-

New York, N. Y.

Members-at-Large

(*Term expiring June 30th*, 1929)

H. T. Sands, *Ex Officio*, Electric Bond & Share Co., New York, N. Y.

C. L. Collens, Reliance Electric & Manufacturing Co., Cleveland, Ohio

G. E. Cullinan, Graybar Electric Co., Inc., New York, N. Y.

E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

Harry Reid, National Electric Power Co., New York, N. Y.

James R. Strong, Tucker Electrical Construction Co., New York, N. Y.

(*Term expiring June 30th*, 1930)

D. C. Barnes, Stone & Webster, Inc., Boston, Mass.

H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

Gerard Swope, General Electric Co., New York, N. Y.

(*Term expiring June 30th*, 1931)

John P. Coghlan, Pacific Gas & Electric Co., San Francisco, Cal.

H. M. Edwards, The New York Edison Co., New York, N. Y.

E. M. Herr, Westinghouse Electric & Manufacturing Co., New York, N. Y.

National Section Chairmen

Accounting—John F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

Commercial—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

Engineering—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

Public Relations—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Geographic Division Presidents

Canadian—P. S. Gregory, Shawinigan Water & Power Co., Montreal, Canada

Eastern—F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.

East Central—C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio

Great Lakes—J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.

Middle West—Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.

New England—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

North Central—L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.

Northwest—R. M. Boykin, Puget Sound Power & Light Co., Seattle, Wash.

Pacific Coast—Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.

Rocky Mountain—Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.

Southeastern—C. A. Collier, Georgia Power Co., Atlanta, Ga.

Southwestern—J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.

Public Policy Committee

Chairman, R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Vice-Chairman, W. W. Freeman, Columbia Gas & Electric Corp., New York, N. Y.

P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Henry G. Bradlee, Stone & Webster, Inc., Boston, Mass.

N. F. Brady, The New York Edison Co., New York, N. Y.

B. C. Cobb, Allied Power & Light Corp., New York, N. Y.

Frank L. Dame, The North America Co., New York, N. Y.

J. E. Davidson, Nebraska Power Co., Omaha, Neb.

Henry L. Doherty, Henry L. Doherty & Co., New York, N. Y.

Alex Dow, The Detroit Edison Co., Detroit, Mich.

Charles L. Edgar, The Edison Electric Illuminating Co., Boston, Mass.

Halford Erickson, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. Gossler, Columbia Gas & Electric Corp., New York, N. Y.

A. R. Graustein, International Paper Co., New York, N. Y.

Franklin T. Griffith, Portland Electric Power Co., Portland, Ore.

C. E. Groesbeck, Electric Bond & Share Co., New York, N. Y.

Edwin Gruhl, The North American Co., New York, N. Y.

A. F. Hockenbeamer, Pacific Gas & Electric Co., San Francisco, Cal.

Martin J. Insull, Middle West Utilities Co., Chicago, Ill.

Samuel Insull, Commonwealth Edison Co., Chicago, Ill.

W. A. Jones, Henry L. Doherty & Co., New York, N. Y.

John W. Lieb, The New York Edison Co., New York, N. Y.

Thomas W. Martin, Alabama Power Co., Birmingham, Ala.

Thomas N. McCarter, Public Service Electric & Gas Co., Newark, N. J.

John B. Miller, Southern California Edison Co., Los Angeles, Cal.

Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

J. J. O'Brien, H. M. Byllesby & Co., Chicago, Ill.

J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. Pack, Northern States Power Co., Minneapolis, Minn.

A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

H. T. Sands, Electric Bond & Share Co., New York, N. Y.

Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. Sloan, The New York Edison Co., New York, N. Y.

Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

R. P. Stevens, Allied Power & Light Corp., New York, N. Y.

Frank M. Tait, The Dayton Power & Light Co., Dayton, Ohio.

George N. Tidd, American Gas & Electric Co., New York, N. Y.

Herbert A. Wagner, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

Owen D. Young, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

John F. Gilchrist, Commonwealth Edison Co., Chicago, Ill.

T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Guy W. Talbot, Pacific Power & Light Co., Portland, Ore.

Geographic Divisions State Associations

Canadian Division

(*Entire Dominion of Canada*)

Canadian Electrical Association
President, P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary*, H. M. Lyster, Room 712, Power Bldg., Montreal, Can.
(*This Division Has No State [Provincial] Section*)

*Eastern Division

(*New Jersey, New York, Pennsylvania*)

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association
President, Charles S. Ruffner, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary*, Charles H. B. Chapin, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association
President, C. H. Howell, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary*, S. F. Delany, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association
President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

East Central Division

(*Kentucky, Ohio, West Virginia*)

President, C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer*, D. L. Gaskill, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities
President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. Kelley, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia
President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. Bliss McCrum, Box 1483, Charleston, W. Va.

Great Lakes Division

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.; *Secretary*, Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association
President, E. F. Kelly, Central Illinois Public Service Co., Springfield, Ill.; *Secretary-Treasurer*, George W. Schwaner, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association
President, C. V. Sorenson, Central Indiana Power Co., Indianapolis, Ind.; *Secretary-Treasurer*, William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section
President, Howard Pett, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer*, Herbert Sylvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association
President, C. R. Phenicie, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary*, John N. Cadby, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*Middle Atlantic Division

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association
President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia
President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer,* H. E. Weeks, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. Lee Jones, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, A. E. Reynolds, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer,* F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary,* Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.; *Secretary,* John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, R. M. Boykin, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary,* Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary,* Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.; *Secretary,* O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. Board, Public Service Co. of Colo., Denver, Colo.; *Secretary,* O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, C. A. Collier, Georgia Power Co., Atlanta, Ga.; *Secretary,* C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.; *Secretary,* S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. Scherer, United Telephone Corp., Watonga, Okla.; *Secretary,* Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. Burke, Stone & Webster, Inc., Houston, Tex.; *Secretary,* E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—Frank Leroy Blanchard, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World,* New York, N. Y.

Public Policy Committee—R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. Davidson, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Allied Power & Light Co., New York, N. Y.

***Membership Committee**—Howard K. Mohr, The Philadelphia Electric Co., Philadelphia, Pa.

***Rural Electric Service Committee**—Charles F. Stuart, Northern States Power Co., Minneapolis, Minn.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—J. F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

Budget Committee—B. S. Rodey, Jr., The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. Hasbrouck, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. McCormick, Middle West Utilities Co., Chicago, Ill.

***Customers' Records Committee** — Douglas Brown, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Fixed Capital Committee**—J. A. Rockwood, Portland Electric Power Co., Portland, Ore.

***General Records Committee**—K. B. Crumb, American Gas & Electric Co., New York, N. Y.

***Purchasing and Storeroom Committee**—W. G. Young, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee—Guy W. Thomas, Public Service Co. of Colorado, Denver, Colo.

General Power Committee—H. C. Thuerk, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—T. O. Kennedy, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. Daniels, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. Harold, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. Dunn, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—J. A. Johnson, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co., Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co., Atlanta, Ga.

***Meter Committee**—E. E. Hill, The New York Edison Co., New York, N. Y.

***Overhead Systems Committee**—Harold Cole, The Detroit Edison Co., Detroit, Mich.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World,* New York, N. Y.

***Prime Movers Committee**—E. B. Ricketts, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co, Detroit, Mich.

***Underground Systems Committee**—J. W. Sylvester, The Philadelphia Electric Co., Philadelphia, Pa.

Public Relations National Section

***Section's Executive Committee**—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—Carl D. Jackson, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. Hodge, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—Homer E. Niesz, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. McManis, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. Vivian, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

***Women's Committee**—Miss Sophia Malicki, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

Conventions and Meetings

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

June

3 Women's Committee, 9 a. m. and 2.30 p. m., Garden Lounge, Dennis Hotel, Atlantic City, N. J.

3 Accident Prevention Committee, 9.30 a. m., Traymore Hotel, Atlantic City, N. J.

3 National Executive Committee, luncheon-meeting, 1 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Rural Electric Service Committee, 2.30 p. m., Traymore Hotel, Atlantic City, N. J.

3 Rate Research Committee, Traymore Hotel, Atlantic City, N. J.

3 Accounting National Section, Executive Committee, 3 p. m., Westminster Hall, Chelsea Hotel, Atlantic City, N. J.

3 Commercial National Section, Executive Committee, 3 p. m., Room No. 2, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Engineering National Section, Executive Committee, 3 p. m., Room No. 1, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Public Relations National Section, Executive Committee, 3 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

4 Electrification of Steam Railroads Committee Luncheon-Meeting, 1 p. m., Hotel Shelburne.

4 Geographic Division Secretaries Luncheon-Meeting, 1 p. m., Hotel Traymore.

4 Statistics Committee Luncheon-Meeting, 1 p. m., Hotel Chelsea.

4 National Food Preservation Council Regional Directors Luncheon-Meeting, 1.30 p. m., Rose Room, Hotel Traymore.

4 *Board of Directors, Society for Electrical Development, Traymore Hotel, Atlantic City, N. J.*

5 Class "D" Members (Manufacturers), 12.30 p. m., Municipal Auditorium, Atlantic City, N. J.

5 State Public Utility Information Directors, 1 p. m., Club Room, Hotel Traymore, Atlantic City, N. J.

6 Public Policy Committee, luncheon-meeting, 1 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

10–15 *Westinghouse Agent-Jobber's Association, The Homestead, Hot Springs, Va.*

14 *Board of Directors, Society for Electrical Development, New York, N. Y.*

16–18 North Central Geographic Division, Breezy Point Summer Resort, Pequot, Minn.

18–21 *Society of Automotive Engineers, New York, N. Y.*

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division, Del Monte, Cal.

20–21 Accounting Section, Wisconsin Utilities Association, Sheboygan, Wis.

24–28 *American Society for Testing Material, Atlantic City, N. J.*

24–28 *American Institute of Electrical Engineers, Swampscott, Mass.*

26–29 Northwest Geographic Division, Seattle, Wash.

July

1–4 *American Society of Mechanical Engineers, Salt Lake City, Utah*

1–5 *American Home Economics Association Convention and Exhibition, Statler Hotel, Boston, Mass.*

18–19 Electric Section, Wisconsin Utilities Association, Hotel Wausau, Wausau, Wis.

August

27–30 *National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.*

September

2–4 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs, Colo.

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 *American Society for Steel Treating, Cleveland, Ohio.*

9–14—*Association of Edison Illuminating Companies, Quebec, Canada.*

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

28–30 *American Electric Railway Association Convention and Exhibit, Municipal Auditorium, Atlantic City, N. J.*

30 *National Safety Council, Stevens Hotel, Chicago, Ill.*

October

1–4 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

1–4 *National Safety Council, Stevens Hotel, Chicago, Ill.*

7–10 *Third National Fuels Meeting, American Society of Mechanical Engineers, Bellevue-Stratford Hotel, Philadelphia, Pa.*

14–18 *American Gas Association, Atlantic City, N. J.*

New Members

Electric Light and Power Companies (Class A)

Missouri, St. Louis, Commonwealth Utilities Corporation
New York; New York, North American Gas & Electric Company

Employees of Electric Light and Power Companies (Class B)

California, San Diego, San Diego Consolidated Gas & Electric Co.
  William H. Bamber (Encante, Cal.)
  G. A. Ferguson
  F. T. Hutcheson
  Carl E. Messinger
  Raymond A. Watts
California, Riverside, Southern Sierras Power Company
  I. C. Bishop (Inyokern, Cal.)
  Miss Grace E. Brown
  Ernest U. Bulpitt (Bishop, Cal.)
  Vernon R. Burkett
  Jas. H. Cameron (Bishop, Cal.)
  Gilbert Caro-D'alvaille
  John F. Cochran
  Wade S. Cook (Coachella, Cal.)
  W. J. Elstin (Coachella, Cal.)
  Paul L. Emerson
  Herbert L. Gauldin (Barstow, Cal.)
  G. E. Glazier
  Fred J. Goellner (Yuma, Arizona)
  P. F. Helton (Banning, Cal.)
  A. A. Higginbotham (Goldfield, Nevada)
  W. B. Irvin (Trona, Cal.)
  C. H. Johnston (El Centro, Cal.)
  J. C. Kerr
  Fred H. Krastel (San Bernardino, Cal.)
  Charles T. Lowndes (San Bernardino, Cal.)
  H. T. McKenzie (San Bernardino, Cal.)
  F. E. Niemeyer (San Bernardino, Cal.)
  H. R. Pixley (San Bernardino, Cal.)
  Malcolm A. Ross
  John F. Russell (Hemet, Cal.)
  Harvey W. Smith (Pomona, Cal.)
  R. L. Taylor (Bishop, Cal.)
  Ray L. Thomas (Coachella, Cal.)
  Ernest Vigus (San Bernardino, Cal.)
  Walker S. Waring (Redlands, Cal.)
  Bryant Weeks (San Bernardino, Cal.)
  Stanley Welk
  Clarison Wilbur (San Bernardino, Cal.)
Connecticut, Thompsonville, The Northern Connecticut Power Co.
  George R. Wilson
Connecticut, Waterbury, The Connecticut Light & Power Co.
  A. J. Drummond
  Miss Beatrice A. M. Fiske (Waterville, Conn.)
  E. Harold Keeler (Seymour, Conn.)
Georgia, Atlanta, Georgia Power Company
  Miss Ruby Bowden
  Miss Charlotte M. Keith
  Miss Evelyn Withers
Idaho, Boise, Idaho Power Company
  J. B. McLain
  J. F. Murphy
  Howard E. Waterman
Illinois, Chicago, Commonwealth Edison Company
  M. H. Fritzsche
  Charles B. Johnson
Illinois, Chicago, Illinois Power and Light Corporation
  A. P. Champlin (Galesburg, Ill.)
Illinois, Chicago, Public Service Company of Northern Illinois
  George G. Bailey
  Walter E. Brieschke (Cicero, Ill.)
  Harry M. Brown
  Walter J. Collins (Waukegan, Ill.)
  Charles Dunn, Jr. (Evanston, Ill.)
  C. E. Eichhorn (Maywood, Ill.)
  Orville E. Fry
  F. A. Kobler
Illinois, Dixon, Illinois Northern Utilities Company
  Arthur Nelson
Indiana, Hammond, Northern Indiana Public Service Company
  J. T. Brusky (Chicago, Ill.)
  Harry M. Keller
Indiana, Indianapolis, Indianapolis Power & Light Co.
  Thomas W. Ayton
Indiana, Marion, Indiana General Service Company
  Paul B. Dougherty
Iowa, Dubuque, Interstate Power Company
  H. A. Moline (Bemidji, Minn.)
  Charles F. Sonnenberg (Crookston, Minn.)
Kentucky, Louisville, Kentucky Utilities Company
  Miss Louise Riedel (Lebanon, Ky.)

New Developments

(*Continued from page* 394)

tains accounts of many pieces of apparatus developed by utility companies which should be of interest and benefit to others.

The committee points out that no attempt is made to verify the claims made for the devices described in this report. Although the devices described are not given an official approval of the Meter Committee, material contained in this report is worthy of consideration and investigation.—*E. S. B.*

International Association Proceedings

THE Union Internationale des Producteurs et Distributeurs d'Energie Electrique announces the publication of the proceedings of the congress of that organization held in Paris, July 5-16, 1928.

The Union Internationale is an organization quite similar to our own National Electric Light Association but international in character. Its membership includes representation from all Continental European countries and Great Britain, as well as from Asiatic countries and the Americas. The subjects covered in their proceedings are similar to our own and provide a valuable record of European views upon the subjects that engage the attention of our own organization.

The proceedings of the 1928 congress consist of a volume of 960 pages and may be had for 150 francs plus cost of carriage. Orders should be addressed to the Union Internationale des Producteurs et Distributeurs d'Energie Electrique at 26 Rue de la Baume, Paris, and remittance made preferably by international money order.—*A. M.*

CORRESPONDENCE

To the Editor:

In the April issue of N. E. L. A. BULLETIN I notice an interesting new department under the title "The Reviewing Stand." For your information, this phrase was registered in the United States Patent Office in 1926 as a trade mark of International Paper Company, and since then it has headed a page every month in *International Paper Monthly,* the magazine which we print for our employees.

You may wish to mention this fact in the BULLETIN or you may not want to. You are at perfect liberty to continue using the phrase without saying anything, but I am mentioning the above as I naturally feel rather flattered that you have also commenced using this phrase.

As you probably know, the New York *Sun* has a column of that name in its weekly book review section. The *Sun* commenced using the name shortly after I had it registered.

F. T. HARRIS.

International Paper Company,
New York, N. Y.

The Editor was unaware that the caption, "The Reviewing Stand," was copyrighted. The kind permission of Mr. Harris and the International Paper Company for its continued use in the BULLETIN is appreciated.

Considering Certain Obligations

(*Continued from page* 360)

public schools. There is nothing new, unique or startling about such an inquiry. In fact, it would be well if the idea could be extended and every great industry *persuaded,* if you please, to make exactly the same sort of inquiry and call the attention of both authors and publishers to any glaring inaccuracies. That is, unless we adhere to the idea that it makes no difference what our children are taught as long as the teaching is done by professional educators and as long as the text books used have been approved by these same educators. To this I cannot subscribe.

The fact remains that somehow, somewhere, there is a very distinct strain of obligation resting on the light and power industry, just as it rests on every other great industry, to do everything in its power to assist that great institution, American Education. I believe this obligation is recognized by a majority of the educational institutions, for certainly they seem to have no hesitancy in asking for cooperation and help and no hesitancy in expressing their appreciation for this addition to the service the industry is already giving the public. There are those who do not agree; but a certain number of fleas are good for any dog.

Engineering Section Report

(*Continued from page* 350)

who in turn are the engineers actually responsible in their own companies for the work covered by the reports. It is earnestly recommended that all member companies place standing orders with Headquarters for new reports of the various committees as they are issued, in order that their engineers may keep fully informed on the engineering developments in the industry.

Guide to This Issue

Superhumans for Better Institutions, 405

John F. Gilchrist

The electrical industry is a business which any young person seeking a life work and an opportunity for service may place at the head of possible occupations. The greatest need of the industry is for the superior type of men and women, intellectually and physically.

Promotional Domestic Rates, 409

Samuel Ferguson

An argument for the promotional rate, and a discussion of its use by the Hartford Electric Company.

This Half-Century of Unparalleled Advancement, 415

Julius H. Barnes

A panoramic review of the advancement in science and social conditions since the invention of the first practical incandescent lamp.

Amplifier Considers Industrial Migration, 419

Amplifier

A discussion of the factors involved in the location and relocation of industrial plants.

Behind the Veil: The First Civilized American, 421

Ernest Greenwood

The fourth of a series which portrays against a social-historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

Relation of Codes and Standards to Power System Engineering, 424

E. C. Stone

Comments on the National Electrical Code, 427

A. R. Small

The Need for a More Liberal Code, 427

E. W. Lloyd

A group of addresses made at a Conference of company code representatives held in Chicago.

National Section Chairmen Are Appointed for the New Administrative Year, 429

Announcement of appointments, and biographical sketches of the new chairmen.

Progress of National Food Preservation Program, 430

C. E. Greenwood

An account of the developments, to time of going to press, of this country-wide activity.

Light's Golden Jubilee, 431

General news of Light's Golden Jubilee developments. An account of the celebration at Niagara Falls. Announcement of Prize Winners in Essay Contest.

Mechanics of Correspondence, 433

Frank R. Mitchel

The necessity and importance of a survey and check-up on the handling of company mail. Reference is also made to a follow-up system which will insure prompt replies, and to a filing system.

Departments

Service Suggestions

See "Mechanics of Correspondence," page 433, noted above.

Interpretations of Electrical Development

Current Statistics of the Electric Light and Power Industry, 436

Basic Information on the Light and Power Industry, 437

N.E.L.A. Index of Industry and Trade, 437

Taxes Consume Ten Per Cent of Light and Power Company Revenue, 437

Energy Supply of the United States, 438

Conservation of National Resources Accomplished by Electrical Industry, 438

Statistical Data for the Electric Light and Power Industry for 1928, 439

Contains complete data for the year.

Accounting Section

Machine Accounting Systems for General Books and Records, 444

Results of a survey of the use of mechanical systems for bookkeeping by electric light and power companies.

THE PRESIDENT'S PAGE

Orderly Development and Progress

OUR Association this month enters a new year in its affairs under a new administration. Its policy is so wisely adjusted, however, that a new administration is merely a slightly changed group of officers. Continuity of policies and personnel thus is preserved, and orderly development and progress in Association business becomes assured. In this we accurately reflect conditions in the great industry the Association represents.

Whatever surface changes take place, underlying them, giving form to them, there is orderly development of the industry. There is progress in its job of supplying an essential service to the public, and such development and progress continue and will continue because ours is an industry thoroughly cognizant of its responsibilities and possessed of a determination to live up to them in fullest measure.

Its course shows an unbroken record of reaching more people and more territory with service each year. Standards of service have been raised notably in recent years. There has been a steady decline in the prices charged for service. The average of domestic rates now is far lower than before the World War.

Thus our industry, year by year, becomes of wider usefulness and builds itself more firmly into the economic structure of the country. It proves its spirit by its works.

Production and sales of current increase annually. Thus we have a right to believe that the public we serve recognizes and appreciates a good job, because our service is used only as it proves well worth the price paid for it.

President.

mkwh

UNLESS there is a serious recession in the activity of the country's business, the year 1930 will see a production of electricity in excess of 100,000.000,000 kilowatthours. Another digit will thus be added to the long line of numbers which measure the nation's power supply. The extraordinary size of the figures which the smallest of our prevailing unit of measure produces wherever any aspect of present-day electric service is mentioned, renders such discussions entirely incomprehensible to the layman and easily and frequently garbled by the usual writer and printer.

In every phase of human endeavor, the unit of measurement is commensurate not only with the size of the object measured but also with the accuracy it is possible to attain. Nobody counts the production of writing paper by individual sheets or that of pig iron by pounds or measure astronomical distance by miles. Similarly, few statistics are accurate within one-tenth of one per cent. In other words, in any line of figures the first two are presumably correct, the third may be too large or too small by one unit, and the remainder of the numbers usually serve merely to give an air of fictitious and undeserved accuracy.

Several weeks ago the *Electrical World* suggested the use of "megawatthour" to signify a million watthour units as a term to supplement kilowatthour. We would like to go the *World* one better and propose a prefix which will express output in billions of units, and thereby eliminate six out of a possible eleven ciphers, instead of three as would be the case with the use of megawatthour. In line with the tradition of Greek terminology, this might perhaps be called "makrokilowatthour," signifying a billion watthour units. Its abbreviation to "mkwh" would facilitate easy absorption by industry and public.

The adoption of this term would, among other things, conserve space, minimize the chances for typographical and other errors and convey to the public a more understandable idea of the magnitude of electric service.

kw-hr. or kwh

FOR a number of years the abbreviation for kilowatthour recognized as official in the United States has been kw-hr. Most publications, both commercial and those of the technical societies and associations, undoubtedly have made an honest effort to conform in its use—but, alas, with not always happy results, as witness the following list:

Kw.-hr.	Journal A I E E
kw.hr.	Electrical World Electrical Merchandising Electrical West Public Service Management
Kw-hr.	N.E.L.A. Proceedings
kw-hr.	Electrical World N. E. L. A. Proceedings Power Plant Engineer Journal A I E E
kw.Hr.	Electrical News (Canada)
kw.-hr.	Electrical Journal
K.W.hrs.	Electrical South
K.W.H.	East Central Division Monthly Financial Digest
KWH	Public Service Management
kwh.	Electric Light and Power

This list was prepared after a casual inspection of the publications quoted. It could probably be doubled by a little earnest research.

In the scrutiny of a number of representative power company rate schedules, and bills to consumer forms, almost as great a diversity in abbreviation was detected, although the majority of companies may be divided into three distinct schools: those that take no chances and spell kilowatthour in full; those that abbreviate with capital K W H without periods, or with periods in assorted positions; and those who use lower case kwh, with or without a final period.

From conversation with a number of the staff, and with visitors to Headquarters, it develops that all who were interviewed, while either knowing, or knowing of the official abbreviation, think and write in the terms of kwh rather than in the longer form.

The abbreviation kw-hr. no doubt originally received its official standing for some logical reason. Perhaps it came into being when kilowatthour was so novel a term that a distinct and unmistakable abbreviation was considered a necessity. Whatever the reason it can hardly hold force today. The present recognized abbreviation is too long. It's complexity invites too many variations even when an effort is made to use it correctly. It has not been accepted by the majority who have need to use it frequently. An officially recognized shortening to kwh would be a boon to writers, editors and readers.

Common Sense

INTERPRETATIONS of the essentials of ordinary "common sense" may differ. Certainly, however, everyone will agree on the desirability of avoiding hazards carrying potentiality of serious accidents. That such hazards may be caused or allowed to exist in the homes, through lack of knowledge, is a fact proved by occasional reports of accidents. In proportion to the nation-wide exposure and possibilities, the frequency of these accidents is very low. The hazard is nevertheless a fact.

If users of electricity can be simply informed in the essentials of proper use and avoidance of the conditions under which a potential hazard is converted into an accident, the growing volume of defective material will be rendered relatively harmless. With this in mind the Accident Prevention Committee of the Association has prepared a pamphlet entitled "Common Sense," reproduced elsewhere in this issue, which contains ten rules with which every user of electricity should become familiar. Observance of these simple rules should practically eliminate the chances for hazard in the domestic use of electricity.

Super-Humans for Better Institutions

By JOHN F. GILCHRIST

Mr. Gilchrist is a vice-president of the Middle West Utilities Company, and a former president of the National Electric Light Association. This address was delivered at the Fifty-Second Convention of the Association held at Atlantic City, June 3-7, 1929.

TO the strong, intelligent, thinking young people of America; to the self-sacrificing men and women of high purpose and high attainment who constitute the faculties and the officers and trustees responsible for the policies and properties of the great educational institutions of this country, and finally to the directors, officers and personnel of the companies, already great, producing and distributing electricity in this land, this address is respectfully directed.

Upon you rests the responsibility for the proper development of a great fundamental industry, possibly to become the greatest of all industries and the one to which, more than any other, will the people of our country and the world be indebted for the greatest measure of human life and happiness.

The industry whose product gives one man the producing power of scores of men of only a few generations past, that spreads the noonday light over the hours of darkness, that for a trifle provides the poor of today with relief from grinding labor and with comforts and conveniences, life lengtheners, which the money of the rich could not buy in the days of our grandparents.

What Electricity Has Become

I ask you in all modesty to stop a minute and consider what electricity and the electrical industry has already become in our lives, only fifty years since the first practical discoveries were made and we first began to know this wonderful energy, more flexible than the hand of the maiden, more powerful than the arm of the giant, a superb and ideal servant which is already performing so manifold a service in the home, the mart and the factory, and which has already become the life spark of so many great industries, such as those making automobiles, aeroplanes and radios, which would fail and disappear without it, that we can hardly vision the chaos which would prevail if the electric industry were suddenly to be withdrawn. The production and distribution of electricity is an industry engaging directly between three and four hundred thousands of our people, and as an initiator of the use of electricity it may be said to be responsible for the employment in all branches of the industry of over a million; an industry engaging ten billions of the savings of our people, and therefore more democratically owned and managed than any of our great industries, for its seven to ten millions of average citizen-owners far outstrips in numbers that other great group which owns the farms of the country; an industry which serves twenty millions of customers with an amount of energy equivalent to the work of thirty million horses laboring continuously twelve hours per day every day in the year.

One-half of this great development has taken place in the last ten years, forty years of previous growth doubled in ten, the result of a great and numerous people awakening to what electricity will do for them. And who will say that this rate of growth will not continue and even increase.

Need for Superior Personnel

Naturally, this great and rapidly growing industry creates many demands on world resources, any one of which might be the subject of much discussion. I wish to discuss but one, the one which, I believe, is the greatest of all.

Looking to the future, the greatest need of this industry is for men and women—or, might I say, for superior men and women — superior in mental and physical vigor, superior in common sense, superior in general and special education, trained young people with an intimate knowledge of the present-day conditions in the business in which they expect to embark, so that on embarking there shall be the least time lost in finding themselves.

The period of physical vigor in the human being is so short that in occupations where experience added to other qualifications is a matter of so much importance, it is essential that no time should be lost in orienting the trained novitiate so that he may promptly assume the responsibilities of the position for which he has been trained.

The Question of Size

Much thought is being given today to the question of what will be the limitation in size of our great commercial and industrial institutions, how much larger they can become, or to put it another way, as a recent speaker has said, "Are we building up something that will finally overwhelm us physically, mentally, sociologically and politically? Is this machinery of our life getting so complex and overpowering that the human machine is breaking down under it?" What are the limitations of our modern institutions? And if growth is desirable, from the standpoint of humanity's best interests, how can we extend these limitations? Will the human intellect, the human body, the vision, appreciation, determination, self-control of man be such that bigger men and women, better educated, better trained, will develop to take the bigger jobs? Or, to put it another way, must the jobs stop growing in size, regardless of the advantages to the many, because we have reached the absolute limit of human capacity? To a certain extent we are facing this problem in our industry today. The big jobs are being filled, but no one appreciates more than the people that are in them, regardless of their capability, regardless of the fact that they are the best available, how much better fit they might be if they had had the benefit of special training for their present positions, or if they had known when they were young students, or if their instructors had known then as much as the occupants of these jobs now know of the requirements. Of course, that would be impossible and will continue to be, at least until we can see much farther into the future than we can at present, but we now have a much better opportunity to judge of the requirements twenty-five years hence than the present executives had when they began, and much can be done to provide for the future if all concerned will cooperate and make the best use of the knowledge now available. If the student anxious to prepare himself for a useful and effective life, the educator devoting his education and culture to the turning out of a well- developed, well-educated and practical human product and the executives in the electrical industry who are in a position to have the best vision of what is required, will work together on this problem, they certainly can accomplish much.

Always Room at the Top

The old statement that there is always room at the top was never truer than it is today in commerce and industry. How often it occurs that the greatest difficulty is experienced in finding the persons to fill the vacancies left by death or retirement, and while this is conspicuous, in the case of heads of great institutions, it exists in just the same way in the case of the sub-heads, of whom there is a much greater number.

It is not at all uncommon in the present day for a large company to acquire a smaller one principally for the purpose of securing the services of the head of the smaller institution. And to illustrate in another way this dearth of super men capable of filling the biggest of earth's jobs, we can recall many cases where some great property has been seen to thrive and make progress under one man only to retrograde under his successor. In such cases it is impossible to avoid the conclusion that when the able man died or retired there was no one of equal or superior capacity coming along to take his place.

Such situations as I have referred to have not occurred frequently in the electric utility industry, but we are reaching a size and the young men who have grown up with the industry and brought it to this point are reaching a period of life where changes must occur, and therefore, if we are to be alert and progressive and ready for the emergencies, it is important that we should give thought to meeting such situations in our business.

Here, as I have indicated, is a task and a situation in which foresight, proper education and training are most important factors, a situation which should be of the greatest interest to the young men and women of the nation looking for careers, to the educators of the nation who wish to serve by preparing young men and women for effective, useful lives and to the owners, directors and executives of the utilities who wish to constantly improve the efficiency of their service to the public by having superior material to recruit and build up their organizations so that they will render the most complete service in the most satisfactory and economical way.

The very natural way to attack this problem is for the executives of the utilities to turn to the institutions of learning, universities and colleges, present their matter and ask for cooperation. There is little question in the minds of most people at this time that as a preparation for business a college education is very desirable, or to put it in another way, men and women of otherwise equal talents and ability are enough better prepared and consequently enough more effective in business positions if they have college educations than if they have not, to justify the expenditure of the time and money. The utilities, therefore, naturally turn to the producers for their supply of college-bred men and women. In order that these young people may be particularly prepared for the work in which they are going and in order to stir up the interest on all sides, it is desirable to have a very general understanding of the character of the work into which the student is going, so that he may fit in to the best possible advantage and may avoid discouraging experiences and delays in finding himself and getting started. There is so much information which he will want and will have to have that he could so easily acquire along with his other studies and preparatory work that I do not think anyone would question the desirability of such cooperation as I have discussed. Without much study, it is difficult for the college professor or the layman to appreciate the possibilities for the employment of trained men and women in the utility business due to the growing complexities requiring superior training, and also due to the rapid growth of the business and its potentialities generally.

Three Pertinent Questions

May we consider three questions which seem to be very pertinent to this discussion:

1. Why should the young college-bred men and women want to take up work in the electrical industry as their life work?

2. Why should the universities and educational institutions of the country take a great interest in the electrical industry, want to know the most possible about it and want to educate young men and women in a way which will qualify them to do the best and most serviceable work in this industry?

3. Why should the electrical executive want to take into the employ of his company all the specially trained college-bred men and women he can possibly use, and to that end want a close intimacy with the faculties of the nation's higher schools?

Before answering these questions, let us give a little further consideration to the importance of the electric light and power industry and its probable future. Are we wrong—are we egotistical—in believing that our business is quite likely to become the greatest of all businesses?

All business is based on human needs and wants. If the human being sits still upon the earth, he soon dies. If he gets up and becomes active; that is, exerts power and directs it intelligently, he provides himself with the necessities, the comforts and the luxuries of life and living, and the rapidity with which he accomplishes this and the extent to which he goes is primarily dependent upon the amount of physical power at his command. Dr. Scott, President of Northwestern University, has shown in a most interesting way how a high standard of life for the few in past ages was dependent upon some power in excess of the physical power of the individual, generally supplied by slave power and animal power, and how in modern times the new electric power is becoming a substitute, and as a result, even with present development of electric power, there is an equivalent force equal in labor to the labor of many slaves already available to each citizen of our country, which is primarily responsible for present-day prosperity and the great improvement in the standard of living of our people. It would, therefore, seem that the want for power might become the greatest human want as methods for applying it are worked out and as these methods become known to the individual. Mr. Henry Ford is quoted as saying, "Power is the foundation of material prosperity," and also that "This is the age of power." And one hears similar statements on every hand.

However, this does not necessarily mean that the power business will be the biggest business measured in dollars and cents of sales per annum, even though it may be fundamental.

Cost of Power Small Part

As indicated, the modern automobile, the aeroplane, the radio are all dependent for existence, as well as for operation, on electricity. Without electricity we would not have them, and yet the cost of power required in the making of an automobile and the operation of it even including the power required to produce, refine and transport the raw materials, may be only a small part of the price which you pay for the finished motor, so that while power is the dominant factor and controls all the wants, it probably is not the largest item, but even in this last thought we may not be looking sufficiently into the future.

Ten billions of capital is invested in the power business today and the requirements of the people are making it necessary to invest a billion a year at the present time, and this rate of requirement is likely to accelerate, so that I should say it is most conservative to estimate that in twenty years, or at the time when the boys and girls coming out of the colleges today have reached their maximum value, there should be at least forty billions of capital invested in this business.

There is no question in my mind that this industry will shortly pass the railroad transportation business in capital invested and yearly earnings, even were it not almost certain that the operation of all parts of all the railroads by electricity purchased from the power industry is only a short distance ahead.

While it is speculation to attempt to look into the future, it seems reasonable to think that just as we have found ways of transmitting through the air sound and signals which in the early part of the last century we could transmit only by wire (automobiles and aeroplanes have in an experimental way already been controlled and in that sense operated from remote points by wireless), so may the transmission of power by air follow the present distribution methods, opening up great fields for the increased use of power, which, with all the problems of control, distribution, sale and metering which would attend such a wonderful development, will afford fascinating occupation for large numbers of intelligent, trained people.

In short, there is no reason to think that for many years to come the rate of increase in the electrical requirements will not accelerate as compared with the period we have just gone through rather than decrease, and therefore, while I might go into great detail in speculating on what the development may be, I cannot but feel that we are justified in believing that this is a business which any able young person seeking a life work and an opportunity for service may place at the head of his list of possible occupations, and an industry which will have no difficulty forcing itself upon the active attention of those engaged in preparing the young men and women of our nation for the activities of life.

An Active Life of Service

Returning to the questions propounded, the youth should desire to enter the electrical business because it gives him an opportunity for a vigorous, active life of service which is the most worthwhile, in a large and important world's industry, perhaps destined to be the greatest of industries, at good remuneration, with an excellent opportunity to invest his savings advantageously, which is the most sure and honorable way of becoming independent. It brings him into an industry involving some of the biggest and most interesting problems that he will find in any modern world occupation, such as dealing with the human passions, jealousy, envy, personal ambition and greed in organization and overcoming these great obstacles to cooperative progress; the study of human nature and methods of dealing with it to bring out the best in those reactions which develop harmony, collective ambition and all the states of the human mind which result in accomplishment and high production; the art of building the organization where great men with no loss of spirit will work under other great men; intricate, absorbing questions of finance, administration, law and other fields and participation in a business where the opportunities for becoming well acquainted and becoming well known and useful citizens in the community are greater than in almost any other industry.

Interest in Power Industry

The institutions of learning should take a vigorous, personal interest in the electric power industry. First, from the general standpoint, it offers a great boon to humanity, and in order to know all these advantages and derive the greatest benefit from them, general education should involve a rather intimate acquaintance with the up-to-date electrical situation. Further, because of the industry's importance and extremely rapid growth, increasingly large numbers of people will become engaged in it each year, and there is not only a great opportunity of assisting the young people of the nation to get into most desirable occupations, an opportunity to render a great service to humanity by providing most practical education for young men and women who desire to go into this industry and are going into it in large numbers and who very shortly will be dominating its policies, but there is the greatest opportunity of having an important hand in moulding the underlying principles and policies which will govern these utilities a few years hence. Thus, responsibility for the public utility service of the future is now resting upon the shoulders of the educators of the country.

And, lastly, the utility executives should welcome the advent of the college-bred men and women in his business, because it will raise the standard of his company's personnel and will put him in a position to render a better, more satisfactory and more economical service to his public. It will result in the application of brains, modern methods, research and high purpose to his industry, all of which follow in the wake of a well-selected and well-educated personnel. His business will develop scientifically and will grow more rapidly than it would possibly have an opportunity to do if served by mediocre and poorly trained people.

These are not new thoughts: What has already been done to develop such activities and the kind of cooperation we have been discussing? Some sixteen years ago the suggestion was made that relations should be developed between the electric public utilities and the great institutions of learning, and acting on this suggestion, a committee of this Association was formed, composed of professors from a number of the prominent universities and colleges and men prominent in the electric light and power industry. The reason for this desired relationship was that the electric industry was at that time growing at such a rate and furnishing a service of such great usefulness to the people, that those engaged in it began to have some vision of what it was likely to become and to realize that not only should the institutions of learning be familiar with it and up-to-date with regard to it, from the standpoint of general useful information to the great body of their students, but that the industry was requiring more and more college-bred men to take up its work, and it was of the greatest importance that there should be closer relations between the educational institutions and the industry so that these young men would be prepared in a way to make them most useful in the industry in the shortest possible time.

At that time the electrical manufacturing interests of the country had begun to pay considerable attention to the engineering graduates, and the telephone interests also were watching the students through their courses and each was endeavoring to pick out the cream of the men.

Relations with Colleges

This activity on the part of the National Electric Light Association developed the fact that quite a number of electric light and power companies already had relations with their neighboring colleges. The first work of this committee was directed toward accomplishing four things:

1. Assisting faculties, by consultation and suggestion, in the choice of studies for their curricula covering their electrical courses.
2. Working out plans by which more of the undergraduates could get summer work of a class which would be of some value to them from an educational standpoint and at a fair compensation.
3. Furnishing the libraries of the universities copies of worthy and valuable pamphlets and books bearing on the electrical industry.
4. Arranging for an interchange of lectures by electric light men before faculties and student bodies, and by members of the faculties before groups of utility employees.

This committee continued its work up to the outbreak of the World War. Then there was a cessation for a year or two, but after the war the committee was reorganized and has continued with growing interest up to the present time. There is a very excellent understanding on the part of the members of the committee of each other's situation. Through the medium of its various reports, a great many people in the utility industry are informed as to the work of the committee, but until about a year ago its work was not so well known among the educational institutions other than those that had representatives on the committee. Therefore, it was deemed wise to have a representative of the committee who knew the work very well visit the more important educational institutions and familiarize them with what the committee was trying to accomplish.

The committee was most fortunate in being able to make an arrangement with Dean C. O. Ruggles, who at that time had just been called from the University of Ohio to Harvard University, and for that reason could arrange to give more time to this matter than would otherwise have been possible. This was a very happy arrangement, as it would not have been possible to secure the assistance of a man who had a better grasp of the subject, who was better able to present it, or who had as wide and as favorable an acquaintance among college people.

While the primary importance of this relationship between the educational centers of this country and the utilities is the securing of properly trained people for the utilities and the interchange of information which is essential to intelligent prosecution of that work, it is realized by the committee, and was by the original committee, that there are matters of general interest on each side which should be known to both parties, and to the utilities particularly it is of tremendous value to have the benefit of the unbiased views of these men of broadest attainment who make up the faculties of our schools. We have the great forum of the public, but it is not so tangible or accessible as this very logical forum of the leaders of the intelligentsia of the country, and there are many questions which come up in our industry, with regard to which we think we are pretty well informed and of which we believe we are taking a pretty broad view, in regard to which our views may be greatly broadened and and our policies undoubtedly greatly improved by taking advantage of this natural contact.

Relations with Public

The range of these subjects is very wide, involving studies of relations between the utilities and the public, what should be and what is the attitude of the public toward the utilities and the utilities toward the public, what affects this attitude, studies of the relation between large numbers of the people working together cooperatively in one institution like a modern corporation, what conditions are conducive to the most effective work and results, financial questions, engineering questions, sociological questions, matters of research and investigation and almost innumerable questions and angles, all of which have a decided bearing on our business and all of which should receive proper, organized attention in the well-managed institution.

The work of this committee should be receiving the very wide interest and support of the leaders of our industry. The farsighted ones, if not all of them, have begun to concern themselves with finding the well balanced, healthy young people with superior intellects in their respective organizations and training them to fill the important executive positions in the future. Here is a branch of your Association's work which will be of great assistance in this task. I, therefore, commend it to you from the standpoint of your own interests, as well as from the standpoint of the general interest of the industry.

For the Best Interests of All

I fully realize that this relationship between our industry and the educational institutions has been challenged as something improper by certain men in public life and a certain section of the public press, but if we are right in this matter, and I do not think any unbiased person who will take the trouble to learn the facts will think otherwise, this should not deter us. Furthermore, allowances should be made for the necessary time for information as to such activities to be digested by all branches of our body politic. Also, allowances should be made for the fact that, thanks to the sensation-loving proclivities of the average newspaper reader, some of these agencies have personal interests of a circulation character which are served by such attitudes and should not be taken too seriously. Such opposition is, on the whole, wholesome, and despite the fact that many of the statements made by this opposition lack truth and most of the balance are grossly extravagant and misleading, they do tend to develop discussion and careful consideration, and will finally without doubt be found to contribute somewhat to the universally approved plan in the public interest which will ultimately be worked out.

Therefore, as all of the outcome of this situation and responsibility will greatly affect the good of the nation and its people, we hope that this entire matter will receive serious, careful consideration and that all working together we may, with interest and courage, proceed to work out a proper plan of procedure having in view the best interests of our country, our people and our prosperity.

Promotional Domestic Rates

By SAMUEL FERGUSON

I HAVE been asked to talk about electric rates. To many this is synonymous with electric prices, but there is a radical difference, the non-recognition of which often causes misunderstanding.

You have seen statistics that the average price paid in the United States for electricity used in the home is 7.4 cents. This is probably as correct as such statistics usually are, but you would be far from correct to say that 7.4 cents is the average rate at which electric service is offered for home electrification; and yet, this is exactly the impression which is broadcast by those who wish to discover and attack an overbearing power trust.

Let me illustrate by an analogy. Suppose I write and publish a book. I ask the publisher how much it will cost. He tells me $2,600 for the first thousand, and $400 per thousand for each extra thousand. Suppose I order 2000 and, after paying the bill, I find that the books cost me $1.50 apiece.

Now in this case, while it is perfectly true that the average price paid was $1.50 per book, yet that was not the rate quoted, but was the result of the quotation combined with the number I elected to buy.

The resultant bill of $3,000 would have been just the same for the amount I bought if he had quoted me a straight rate of $1.50 per book; but suppose he had quoted this figure per book, and then I had changed my mind and taken some different quantity. He would have been badly stuck if I had taken only 500, and I would have been heavily overcharged if I had taken 5000.

AGAIN, suppose I had a friend who also wanted to publish a book. His would differ from mine only in the fact that it was a good seller, of which large quantities must be printed. Would I be giving him a straight statement if I told him that the publisher, who was known to be a one-price man and played no favorites, charged $1.50 per book, and that if this was too much he had best go elsewhere, or else buy a press and print it himself.

In one respect the book printer and the electric company are much alike in that it costs a great deal to get ready. When once each is ready and has delivered the first book or the first kw-hr., the cost of many more will represent only a small fraction of the cost of the first. When the order is filled, or at the end of the month, the average cost per unit is easily determined, if anyone is interested, but in either case to use this past average cost per unit for the purpose of future price quotations would be extremely fallacious unless the nature of the goods and the quantity were exactly the same as before.

Mr. Ferguson is president of the Hartford (Conn.) Electric Company and a past president of the National Electric Light Association. This article was originally delivered as a graduate lecture in the public utilities course of the Electrical Engineering Department of Yale University.

I believe our statisticians would be able, if they tried, to give us the average price per book for all books printed in the United States; which average figure I have no doubt could be used to prove that United States printers as a class were robbers because of the fact that the average price of the books they printed was much higher than the average of those printed by the Oxford Press; or to prove that some particular printer's prices were either very low or very high because of the fact that his last year's output was sold below or above this average price—which naturally has nothing to do with the case.

My analogy is not exact in that the high cost of getting ready in the case of the printer is due to the operating expense of preparing the plates, etc., while in the case of the electric company, it is due to the capital expense of providing the facilities—the result is, however, just the same in that after these first costs are absorbed, a large amount of additional finished goods can be supplied at a very low cost.

THE illustration I have just used leads directly to a discussion of the fundamental difference between the straight meter rate and the so-called promotional rate for domestic business.

A straight meter rate is the method of charging for all kw-hr. sold, at a price which past experience has shown to be necessary in order to cover the costs of all kw-hr. previously used in a given community. It is exactly analogous to the printer quoting as his price the figure of $1.50 per book, which past experience has shown to be the average price which he has received. In neither case does it take into account the much lower cost of furnishing additional amounts of the finished product beyond the amounts which have, in the past, been furnished; and in both cases if the goods are furnished in small amounts they will be furnished at a loss, which is made up from overcharges on those who buy more than an average volume of books or kw-hr.

The promotional rate, on the other hand, recognizes in its very form the fundamental fact that while the costs of getting ready are high, the cost of the finished product is low provided the "getting ready" item is billed separately.

Everyone recognizes that the promotional rate is logical and equitable in the case of the printer because the process of making books is known, and there is nothing mysterious about the fact that typesetting is an expensive job, while the added cost of the finished book is not much more than the cost of the paper and ink used. But when your meter registers kilowatt hours, it is not at all obvious why there should be exactly the same price differential between some kilowatt hours as there is between the first book and subsequent thousands. As a matter of fact, the cost of getting ready is much higher relative to the cost of the finished unit in the electric business than in the printing business; so much so in fact that the customer is never even asked to reimburse the companies for the cost of getting ready, but only for the annual fixed charges on this cost which is termed a capital expenditure.

The promotional rate may appear in any one of a multitude of forms. Much ingenuity has, indeed, been expended in camouflaging it because of the fact that its equity was not generally understood; but it always has the essential feature that part or all of the fixed costs which do not vary in proportion to the amount of current used are covered either by a fixed monthly charge with a correspondingly low charge for the kilowatt hours used, or by assessing this fixed charge in the price of the first few kilowatt hours used rather than as a separate item.

The higher the fixed charge and the lower the energy charge (within the limits of actual costs of each) the more equitable is the rate, as more nearly representing actual conditions; and the more useful it is as making possible for the user a greater degree of electric service in the home; and the more satisfactory it is to the company in that it stimulates a greater rate of growth.

Fig. 1

Typical Straightline Rate Showing Profit and Loss for Residence Customers

THERE are many degrees of promotional rate, some that vary only slightly from the straight meter rate, some that differ materially, but very few that go even approximately as far as cost analysis indicates to be logical.

The reason for this is, of course, the fear that the public will misunderstand; and also the tremendous political and sentimental pressure exerted on companies to lower the maximum rate previously charged. Companies should not try to go too fast even along the right lines, because they must remember that it is they themselves and the gas companies before them that have educated the public to the idea that kilowatt hours can be sold like sugar at so much per unit.

It is logical for the grocer to sell sugar by the pound because the cost per pound to him represents the major portion of his unit costs.

On the other hand, it is equally logical for the telephone company to sell its local service for a fixed price per month, which price will cover the annual fixed charges of the subscribers' share of the total investment.

The electric business, is, however, in its nature a combination of the grocer and the telephone company in that it supplies a commodity—i.e. coal in the form of kw-hr. and also furnishes a facility—i.e. poles, wire and plant in exactly the same manner as does the telephone company.

What the telephone company actually delivers to your house is electricity just as does the electric company, but in minute amounts. What you want is ability to communicate, and you do not care how it is done. What you want of the electric company is light, heat and power service, but from habit you scrutinize the kilowatt hours which produce these services rather than the services themselves, and you are liable to feel that all kilowatt hours are the same and identical in cost and, therefore, should be in price.

These general statements are sufficient to outline the fundamental differences in the two methods of charging. I wish now to discuss the specific application of each method to a concrete case.

Figure 1 shows the results of a straight meter rate of 8 cents per kw-hr. (minimum charge of 75 cents per month) compared with the costs of a particular company as analyzed and drawn as a curve.

Before going further, let me state that no cost allocation can be 100 per cent correct because of the fact that no two persons will allocate every item of cost in exactly the same manner, but this is no reason why we should not make the allocations to the best of our ability, with the admission that some other allocations, if honestly made, may give a slightly different curve, and are just as likely to represent actual facts as your own allocation.

Therefore, let us take the particular curve for purposes of illustration only understanding that while it may be a little high, or a little low, either in absolute amounts or in slope, it is sufficiently close to the fact so that conclusions drawn therefrom will not be in material error.

You will note:

1. That the abscissa represents the use per month of relatively small amounts of current and the ordinate the monthly bill or cost corresponding thereto.
2. That the cost curve starts at about one dollar for no consumption at all, and increases to about three dollars for use of 65 kw-hr. per month.
3. That the price and costcross curves at 24 kw.-hr. per month, and that at this point, and only at this point, is the price a correct one from a cost standpoint. (I should have stated before that in the item of cost is in-

cluded a return of 8 per cent on the investment required for rendering the service.)

4. At the bottom the chart is indicated (in hundreds) the number of customers in each consumption classification.

5. The shaded blocks represent the total annual losses in dollars for each classification which results from the fact that at these points the price curve falls below the cost curve.

6. The unshaded squares which appear above the 24 kw-hr. point represent the amounts of the annual overcharges paid by customers using more than this amount of current per month, as calculated from the amount the price curve exceeds the cost curve at the various points.

NOW let us see what are the conclusions which must be drawn from these observations:

The 11,600 customers in the classification using from 10 to 15 kw-hr. per month are served at an annual loss of $73,000, or about 50 cents a month each.

It would seem as though this 50 cent loss was too small a matter to talk about except for the fact that 77 per cent of the total number of customers are thus carried at a loss; and the small monthly loss on each reaches the tremendous yearly total of $190,000 when multiplied by the number of losing customers which loss has to be made up on the remaining 23 per cent of the customers.

Reducing this 50 cent loss to terms of kw-hr., it means that these customers are undercharged 4 cents per kw-hr., or approximately 35 per cent. This situation is probably eminently satisfactory to the small user who has no vision of what electricity is able to do for him in the way of increasing his comfort and decreasing his living expenses, but it cannot be equally satisfactory to those who wish to make real use of electric service.

In the case of the 200 customers using from 60 to 65 kw-hr. per month, the charge clearly shows an overcharge of about $2.00 per month. This reduced to cents per kw-hr. shows an overcharge of about 3 cents per kw-hr., or 60 per cent above the cost curve figure of about 5 cents. If it were not for this overcharge, he could for the same monthly payment have had the benefit of more than twice the kw-hr. actually used.

Obviously, if the necessity for an overcharge were removed, and the price correspondingly reduced, all customers would take advantage of the opportunity for greater use and move from the present classification to one further to the right—and this applies equally to those in the small classes where such procedure would of necessity increase the monthly bills of those who did not take advantage of the opportunity to use more.

The net result of the straight line method of charge is then to give a picayune subsidy of *one or two* cents a day to a large number of customers, which subsidy is paid by a smaller group. This in itself would not be so bad if it were not for the fact that the high rate quoted for the more liberal use prevents both groups of customers from using current as liberally as most of them would like to do.

THE public wants the comfort in the home of the many electric aids that exist today, but it cannot afford their use because of the prevailing prices of electricity. The public feels that the utilities should be able to give the greater service which is needed at sufficiently lower unit prices, so that liberal use does not result in a prohibitive bill; and they know that the utilities generally are not so doing. A fallacious but most natural inference follows.

You would say, "If a utility can supply all the electricity needed in a fully electrified house at two or three cents a kw-hr. (which price I could afford to pay), and if that utility insists on charging two or three times this amount, the answer is that the utility is profiteering, and making unreasonable profits." This conclusion is also supported by the fact that the market value of that utility stock has been increasing to a very material degree during the past two or three years.

Consequently, the apparent though not real solution is to strike at the utility's earnings as excessive, and as the only thing to hit seems to be the maximum rate it charges for domestic electricity, you attack that rate as unreasonable. What happens then is that the utility is placed on the defensive and produces evidence to prove, or try to prove, that its earnings are not unreasonable, and that therefore, you should not be so unkind as to object to its rates; and no matter how the rate case ends, you are the loser.

It may look like a victory to have the Commission and Courts decide against the company, and compel a reduction say, from seven to five cents per kilowatt hour, but I ask you if even then you are any nearer to your objectives? There are only a few homes that can afford electric cooking, refrigeration and hot water at the reduced price of 5 cents any better than they could before, and owing to the fact that the company's earnings are greatly reduced by your victory, it has no great enthusiasm about giving you the 2 cents or 3 cents energy which you so badly need in your home, nor could it if it would.

Do I hear you say—"But, at least, it is a step in the right direction?" The message I wish to leave with you is that such a victory is in reality a step backward, and one that makes it almost impossible for the company to give you what you need and desire.

IT has been often urged that a subsidy such as the chart indicates, given to 70 per cent of the customers, is equitable because they are probably poor and need the help. But is such an argument sound? It is not for two reasons:

1. The "limited use" customers are not the poor, but are the wealthy who live in apartment houses and go out for their meals, and can afford flesh and blood servants at $75 per month to do their work.

The poor do their work themselves and are the ones who need the help of the electric servant, whose wage is hardly 5 per cent of the amount paid to the other kind.

2. Even if they were the poor—by what right does the Utility or the Commission undertake to rule that you who wish to use liberally shall have collected from you in your monthly bill a subsidy to be given to the poor so that they can have light at 2 cents a day less and thereby be enabled to buy an extra loaf of bread each week.

Your charities, good and noble though they be, should not be mixed up in your bill for electric service, and they are so mixed whenever rates are such that 70 per cent of the customers are carried at a loss—made up by the contributions collected from the other 30 per cent.

The tabulation in Fig. 2, below, shows a different aspect of the case. Here are figures giving a seven-year record of two companies,—Company (A) using straight meter rate; Company (B) using a promotional rate.

STRAIGHT vs. PROMOTIONAL RATE

COMPANY A.

Year	*Average Domestic Price Cents*	*Kw.-hr. per Customer*	*Average Revenue*
1922.........	?	298	?
1923.........	?	307	?
1924.........	9.0	324	$29.00
1925.........	8.5	329	28.00
1926.........	8.0	352	28.00
1927.........	7.0	378	27.00
1928.........	6.0	407	24.50
1929.........	5.5	430*	24.00

*Partly estimated.

COMPANY B.

Year	*Average Domestic Price Cents*	*Kw.-hr. per Customer*	*Average Revenue*
1922.........	8.6	286	$24.50
1923.........	8.0	316	25.00
1924.........	7.6	341	26.00
1925.........	7.1	357	25.50
1926.........	6.8	386	26.50
1927.........	6.4	431	27.50
1928.........	6.0	478	29.00
1929.........	5.5	535*	29.50

*Partly estimated.

Fig. 2

You will note that the use per customer which is a measure of the service rendered has increased in the case of (B) from 286 to 535, or an increase of 87 per cent, while in the case of (A) the increase is from 298 to 430, or an increase of only 44 per cent.

It is obvious that as a useful servant to the community Company (B) excels.

Now the interesting point is that the average price during the major portion of the period has in both cases been practically the same, starting at 9 cents per kw-hr. and coming down to 5½ cents, but in the case of (A) it has been done by reducing the maximum price while (B) has not touched the maximum price, but has applied all reductions to lowering price quoted for additional kw-hr.

NOW look at the results to the company—A (Fig. 2) has gone down in revenue received, from $29 to $24 per customer, while B has gone up from $24 to $29 per customer, and is, therefore, in a position from an earning standpoint to keep on going down in price, while A can hardly do much more than it has done already, unless some other class of business will carry the losses which must accompany a further decrease below $24 per customer. That this revnue per customer is about the low limit can be seen by comparison with the service-at-cost prices charged in Ontario where there are no items of fuel, taxes and profits to be considered.

Recently the City of Toronto increased its domestic prices because they were not self-sustaining in spite of the fact that its revenue was approximately $23 per customer. If in Canada, served by Niagara Falls water-power, with no fuel, no taxes nor profits, $23 is not self sustaining, we can hardly expect $24 to cover all the existing Canadian costs and these three items in addition.

The fact that in Canada each customer obtains for his $23 many times as many kw-hr. as here is quite beside the question, as can be seen from the analogy of the cost of printing books; since what corresponds to the paper and ink is, in the electric business here, largely fuel, and with this absent in Canada there is not even the small added cost for increased use that we have on this side of the border.

The large Canadian average use divided into a perfectly normal monthly payment is what makes true the widely heralded low Canadian domestic prices when stated in the terms of cents per kw-hr. or in terms of service rendered. Our problem is to build up our service rendered to the same high point as theirs, and then, with the same amount used, our prices can be as low as the Canadian save only for about 8 mills per kw-hr. to cover taxes and fuel. I make no allowance for profits as they can come from the superior efficiency of private as compared with municipal operation.

IN Canada, because of the fact that the price of coal is high to manufacturers, it has been possible for the Hydro Commission to make sufficiently large profits from the sale of its water-power to industries so that the losses incurred by dropping the maximum rate for household use to very low figures could be made up from industrial customers, instead of from other domestic customers. This is, however, a very special case, and due wholly to the combination of high coal price and the almost unlimited water-power of Niagara. In this country, if a utility should try the same method, industries simply would not stand for it, but would manufacture their own power with the result that the share of the poles and wires now carried by them would have to be carried by others.

It has been often hotly denied that in Canada domestic business is or ever has been carried by either the taxpayers or other customers, but I think the tabulation in Fig. 3 will tell the story. These figures are official for the City of St. Catharines:

	Per annum
1915—Revenue per domestic customer..	$8.00
1928—Revenue per domestic customer..	23.00

If a customer in 1928 had to be charged $23 in order to be served at cost, what possible chance is there that in 1915 an annual charge of only $8 would cover the cost. While it is true that all items of cost are higher in 1928 than in 1915, still they are nothing like 3 times as great. It is also true that in 1928 customers used very many more kw-hr. than in 1915, yet where there are no fuel bills to pay, or taxes based on the volume of business, the increased use cannot justify any material difference (based on cost) in required revenue.

ANNUAL BILL—ST. CATHARINES

	Per Domestic Customer	
Year	*Kw-hrs.*	
1915	230	$8.02
1916	291	8.08
1917	397	9.28
1918	492	10.26
1919	562	11.36
1920	819	13.03
1921	1027	14.50
1922	1162	15.10
1923	1168	17.28
1924	1603	18.94
1925	1643	19.30
1926	1720	20.50
1927	1800	22.00
1928	?	23.00

FIG. 3

The obvious explanation is that whether or not $23 in 1928 covers the full cost of service, certainly $8 in 1915 did not do so and, therefore, the domestic customer in 1915 was served far below cost, which loss had, of necessity, to be made good from other sources.

PERSONALLY, I think it was a very good plan to follow such a policy as it brought up the average use per customer to about five times our American figure in a very short time, and I would be glad to do so also provided I could find a good Santa Claus who would make up the deficit which obviously existed in this case for many years; but I have sought him in vain, and therefore, since I cannot find him, I believe we should do the next best thing; namely, to make our rates low for the additional kw-hr. which we offer to all customers, but to keep up the rates on small convenience use to a point which will avoid excessive losses. That no such easy method for developing a large use as that employed in Canada is open to us is unfortunate; but the public will not excuse us on this account for failure to produce the desired results.

We shall surely be judged by results and by results alone. There is only one path by which we can reach the same results, admittedly much slower than the easy one adopted in Canada, but I heartily advocate following it just the same. It consists of a rate structure so shaped as to eliminate the losses which are inevitably incurred by low prices to small users, but which will automatically give a low price with liberal use.

Those companies which yield to the demands of political agitation and grant lower and still lower maximum rates are simply laying up trouble for themselves very shortly. To make the maximum price 6, 7 or even 8 cents per kw-hr. without safeguards against the losses incurred by reason of the ten or fifteen-dollar a year customer, is to invite thousands and thousands of nonprofitable customers, which losses must be collected from the liberal users instead of permitting the latter to enjoy the rate which their use would otherwise permit them to earn.

It is natural for the popular cry to be for lowered maximum prices, but this is only because through their lack of knowledge, the public are complaining about the wrong thing. The attack on our maximum rates is coupled with the claim of excess earnings, which naturally irritates and puts us on the defensive.

What the public really wishes is the ability to use electricity liberally at reasonable prices, and because its attack is misdirected at our earnings and maximum prices is no reason why we should not make every effort to give the universal service which is needed.

TO illustrate, let me tell an anecdote: Last year the customers of a small unit in a large holding company brought a rate case before the Commission. The day before the hearing the lawyer came to consult me as to the course he was planning to pursue. He had followed the usual course and was vigorously protesting the existing 15 cent rate on the ground that it was excessive, and that it produced excessive earnings.

I explained to him that the company would have no trouble at all in beating him, as with the existing small use, the earnings could not be excessive; but that what he really wanted was an optional rate, which would automatically produce a low price for a liberal use. So he tore up his case and made the statement at the hearing that the petitioners recognized the 15 cent rate as reasonable, and that under existing conditions, earnings were not excessive, but that still they were dissatisfied because they were not accorded the service of which the company was capable. and were not able to use electricity liberally except at a prohibitive cost.

THE rate expert of the holding company asked for an adjournment because, as he stated, he found himself in the unusual position of having to agree with every contention of the petitioner. Naturally, things were easily fixed to the satisfaction of every one during the recess by filing of an optional schedule of the promotional type.

For several years I have felt that those companies which still stick to the old-fashioned straight meter rate were losing an opportunity for increased profit and usefulness, but a study of the situation as it exists today convinces me that they are also inviting very serious consequences to be expected from public unrest, and at a no remote period.

That I may not reach the goal I set for my company in the appointed time is no reason for not having a definite program, which program is that within five years every customer who wishes to make full use of electricity in his home for light, refrigeration, cooking, hot water and miscellaneous services, shall be able to do so at a rate not to exceed 2½ cents per kw-hr.; and that the average usage shall be so increased that as a result the average revenue from my domestic business as a whole shall be below four cents per kw-hr. for an average of 800 kw-hr. of service.

That this goal is not so very difficult to attain is indicated by the fact that many customers in fully electrified homes are now earning average prices as low as 2 cents per kw-hr., and that in the past few years the average domestic bill has increased from $24 to $29 in spite of a reduction in average over-all unit price of from 9 cents to 5½ cents per kw-hr.

The low resultant unit price for full use in the home obtainable with a system of promotional rates is illustrated by the bill reproduced below. In Fig. 4 you will note that this customer paid $22.33 for 1149 kw-hr., or slightly less than 2 cents per kw-hr. If, however, he had been burdened by making up losses incurred on a multitude of "limited-use" customers served below cost, the rate charged would have had to have been 5½ cents and the resultant bill would have been prohibitive in amount.

I HAVE been severely criticized for using this bill as an illustration, on the ground that it was probably that for the largest domestic use among all of the wealthiest users. As a matter of fact, the largest home-use on our lines is three times this amount, and this particular customer instead of being one of our wealthy citizens is a typical high-grade New England workman who works at a machinists's bench at the Underwood Typewriter Company. The bill is about 10 per cent of his wages, but his statement is that same is not an extravagance as he saves the full amount from other bills which he otherwise would have to pay, and in reducing the labor items in the home.

Inasmuch as the amount used is 25 times that of the present average customer, it is obvious that the companies have before them an almost unlimited field for useful service, if only they will make their rate schedules conform to actual cost conditions rather than to past averages.

Fig. 5 (on page 414) is shown partly for its interest and partly that something in my talk shall bear directly on the subject which I have been asked to discuss; namely, the effectiveness of the promotional rate. The chart shows that from 1916 to 1922 the use per customer did not increase materially. The drop in 1918 and 1919 was, of course, due to war time conservation efforts.

Inasmuch as during the whole period from 1916 to 1928 the same policy and approximately the same degree of effort had been expended on sales effort, some other explanation is necessary to account for the very marked change which obviously began in the year 1922.

The fact that the promotional rate was installed at that date, since when the use has increased to 174 per cent of the 1916 figure, must at least furnish food for thought.

Fig. 6 shows another illustration of the increasing degree of service which a company with a "promotional" rate can render.

CLASSIFICATION OF CUSTOMERS BY USAGE

Per Cent of Customers in Each Class

Yearly Kw-hrs. Used	*Hartford Year* 1921	*Hartford Year* 1928	*Co. X Year* 1928

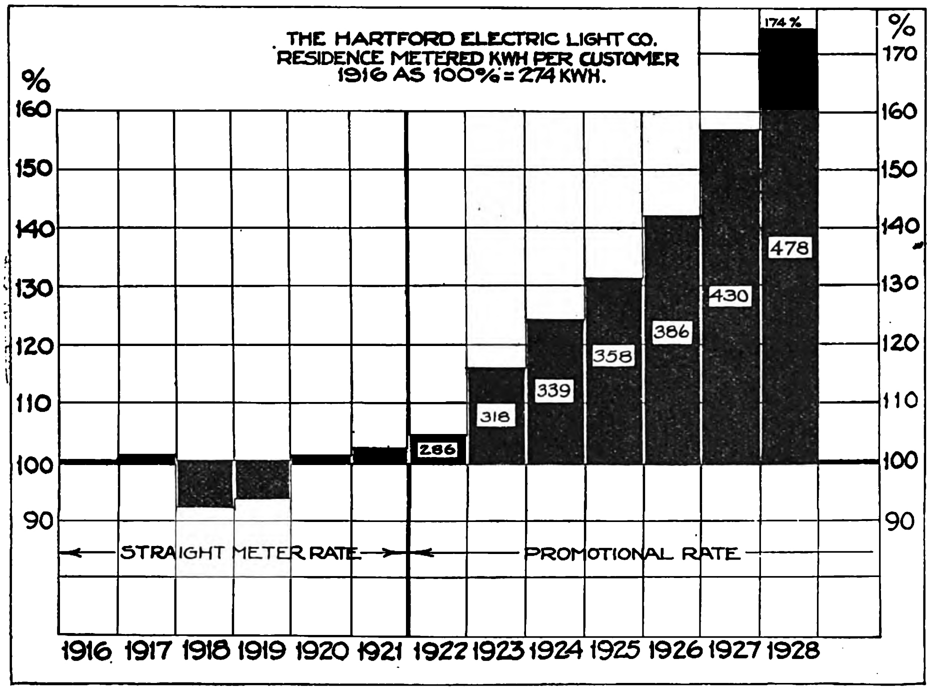

FIG. 5

a straight meter rate) 90 per cent of the customers used less than 500 kw-hr. per year. This percentage also holds true of Company X even in 1928. In the case of Hartford in 1928 (with "promotional" rate) the percentage of those using less than 500 kw-hr. had dropped to 66 per cent.

The class of those using more than 720 kw-hr. is also interesting.

The increase in Hartford, from 1921 to 1928, was from 2.8 per cent to 16 per cent, while in the case of Company X the 1928 figure was only 4 per cent.

It is impossible to study such tables as these without being in every case impressed with the greater value to the user as well as to the company of a rate which permits of a low price for additional use.

JUST one further illustration—last year the farming community of East Hartford, consisting of about thirty farmers, wanted electric service. They are located in the heart of the hills, about 25 miles from Hartford, in territory not covered in the franchise of any electric company; so they arranged to buy current wholesale at the town line for 2½ cents per kw-hr., and went ahead and built their distribution system complete with meters and transformers. This came to about $12,000.

They were now faced with the question of what price to charge themselves for current so that they could make ends meet. In order to cover local expenses and interest, as well as to maintain the lines, they found that they would need to collect about $1,500 a year above the power bill of 2½ cents per kw-hr.

They found that in the neighboring towns the average use did not exceed 500 kw-hr. per customer per year, and that, therefore, they must charge 13 cents per kw-hr. to come out whole on such average amount of use. They recognized at once that if they charged 13 cents no one could afford to use ranges, refrigeration, water heaters, etc.

As a solution they divided the needed $1,500 among themselves in a fixed monthly payment, graded according to size. This average $4 per month, and then they were free to fix a price of 3 cents per kw-hr. for the current used. Under this condition all the comforts of home electrification are available to each, whereas if all costs were to have been assessed against the kw-hr. sold, the initial price of necessity must have been so high as to prohibit the use of any but the most limited degree of service.

The goal of all companies should be the rendering of the utmost service in return for liberal dividends to be earned therefrom, and the important point to remember is that under the American concept of equitable regulation (every class to be self-sustaining) the above-mentioned goal can never be reached by any company which invites the tremendous volume of losing customers which is the inescapable corollary to a low maximum rate.

I believe that the best interests of our domestic customers would be promoted if it were illegal for any company to ever lower the maximum rate charged for small usage, but instead all corporations should more and more lower the quotations for all electricity, which is, or which may be, used after the costs of getting ready are liquidated.

CONVENTION ADDRESSES

(*In Pamphlet Form*)

A number of the addresses made at the Fifty-Second Convention of the Association have been printed in pamphlet form of a size suitable for mailing in a 4 x 9½ in. envelope.

Titles of pamphlets and authors are:

"The Part Electricity Can Play in Better Home Management", *by Miss Lita Bane*

"Sales Increase or Rate Increase?", *by M S Sloan*

"The Customer's Side of the Meter", *by A. W. Robertson*

"Factors in the Progress of a Great Industry", *by P S Clapp*

"The Trend of the Times", *by David Lawrence*

"The Professional Motive in Public Utility Management", *by Deane W Malott*

"Industrial Development in the United States and Canada—1927 and 1928", *by J L Madden*

"Science and Progress in the Industries", *by J J Carty*

"Practical and Economic Aspects of Standardization", *by L L Elden*

"The Cooperative Work of the National Electric Light Association", *by P S Arkwright*

"Super Humans for Better Institutions", *by J F Gilchrist*

"This Half Century of Unparalleled Advancement", *by J H Barnes*

"The Electrical Industry and Its Public Relations", *by J F Owens*

"The Public Right as to Electric Rates", *by W L Ransom*

"Public Utility Regulation and Its Accomplishments", *by Wm J Hagenah*

Public Policy Committee Report, *by R H Ballard, Chairman*

These pamphlets will be sold by the Association at a nominal cost, in any quantity desired. Prices may be had upon application.

NATIONAL ELECTRIC
LIGHT ASSOCIATION
420 Lexington Ave., New York N. Y.

This Half-Century of Unparalleled Advancement

By Julius H. Barnes

THIS occasion marks the Golden Jubilee of the Electric Light. It provides, as well, a popular testimonial of admiration and affection for the inspired labors and for the simple life of America's foremost inventive genius. Fifty years of spotlight distinction have invested his character with a national regard bordering on reverence. That half century of time spans a period in history of most intense human interest. Certainly no other half century in world history could possibly have equalled the myriad changes of this single era. The contrasts disclosed by a comparison of the living habits of these dissimilar days have clearly widened the horizon of human health, welfare, opportunity and content.

A Life of Unique Distinction

A peculiar interest would attach to that comparison because these changes have come within the span of a single life. When that single life itself, as in the case of Thomas Edison, has been also a potent force in working the miracles in modern science and invention, it acquires a unique distinction. It would be title clear to fame for a single mind to carry into practical perfection a device for lighting which has been improved but not displaced by fifty years of intensive inventive progress. But Edison's distinction rests not alone upon the idea of a light itself, but on the wider, daring conception that the subtle force of electricity could be harnessed to control, and be distributed flexibly at point of use. Even Edison's painstaking study, and even Edison's soaring imagination could not at that early day have visualized that the wire which entered America's homes for lighting would have later become the channel of fluid power which established in every individual home its own power plant. It would be interesting if today there could be preserved the changing images of the inventor's mind as he saw the feed wire, planned for simple lighting alone, drawn upon in the course of time to successively operate the electric iron, the vacuum cleaner, the washing machine, the electric range, the refrigerator and the radio. So, also, it would be interesting to visualize the successive steps, with accelerating speed, by which the flexible power distribution of which he was the pioneer, so proved itself in competitive use for industry that it has revolutionized the power plants of our factories.

Mr. Barnes is chairman of the Chamber of Commerce of the United States and was president of the Chamber during 1922-1924. He is president of the Barnes-Ames Company, wheat exporters and is connected with other business firms. During the war he was president of the United States Food Administration Corporation, and has rendered other important public services to this and other countries.

This address was delivered during the Fifty-Second Convention of the National Electric Light Association at the Public Policy Session.

Industry has always had its sources of power: the water wheel, fuel generated steam, the combustion engine—but none of these serves industry so directly and with so much economy as does the flexible force carried to its point of use through the distribution inspiration of Thomas Edison. His concept of fifty years ago of ready distribution, limited in vision as it was, of necessity, in that day, is the basis today for American homes freed of household drudgery; of American farms lifted from the shadow of relative isolation; of industry that has put a premium on intelligence and skill and lifted the crushing burden from the bent backs of labor. Flexible power, easily transported, is the moving force in successive inventions that raises steadily the general average of possession and living.

The science of electricity is indeed of world-wide origin and development. The super-intellects of all peoples have contributed to its understanding and its use. We measure the practical unit of electrical resistance today in the name of the German scientist Ohm. We measure the flow of electric current along a wire in the name of a French mathematician, Ampere. We measure the force required to cause a current to flow against resistance in the name of the Italian physicist, Volta. We express the unit of electrical power in the name of a Scottish engineer, Watt. But in all of America and throughout the world, every shade and variety of electrical service, the finest of subtle pulsations and the most tremendous physical forces are expressed to every ununderstanding with the single name of Edison. No single mind today has contributed so largely to our whole social advance, and when, as well, that single life has preserved the simplicities of living unswayed by an adulation which falls to few men in history, it is the reassurance also of the real quality of America. All America does itself honor to honor in this Golden Jubilee the intellectual achievements and the personal qualities of the man whose name is inseparably linked with that subtle fluid energy which is the very life of modern living. His name will be remembered as long as man can speak and as long as man can hear.

A Half Century Ago

Now, half a century of human progress spanned in this field by a single life, and that life the acknowledged leader, must present comparisons of extraordinary popular interest. What were the habits of industry; what were the social customs; what were the popular conceptions and ideals of the world of fifty years ago, and how have they changed for good or ill? Since the daily press of a people probably most accurately reflects the everyday practices and customs which enable us to gage the conditions of their living, it is interesting to go back to the newspaper of half a century ago.

For example, in *Leslie's Weekly* of 1879 there is a news item recording a patent granted Thomas A. Edison for electric lighting apparatus—an insignificant item in itself, and manifestly conveying at that moment neither to publisher nor to public anything of the vast import which fifty years of history have since recorded.

Something of the coming revolutionary character of this invention is shown shortly thereafter when the New York *Sun* comments editorially on the panic in gas company shares which had been occasioned by the manifest progress in electric lighting. The editorial suggests that the investment in gas manufacture and distribution might be saved "if gas could be made available for cooking, and ladies could thus become expert cooks." As a matter of normal development since, gas has become the universal cooking fuel of our great cities, and, of course, every lady in this audience and that of the radio can testify that she has become, and is, an expert cook. Otherwise, how account for the spread of the delicatessen and its ready-cooked foods?

Pioneer Advertisers

Advertising in the newspaper of fifty years ago averaged about 20 per cent of its content, and today 60 to 65 per cent, although today's news columns cover home and world news with a completeness which was not possible with the limited communications of those early days. This is why you buy a daily newspaper today for half the price, though with four times the news. The limited advertising of New York newspapers fifty years ago, however, shows a continuity of American business which is extraordinary—Lord & Taylor, Daniels, Stern Bros., Macy's, Hearn's, Altman's, Sloane's. Their vast assortments and their imposing buildings in the very heart of Fifth Avenue fashion today are the half-century outgrowth of dependable merchandising which, at reasonable prices, pioneered the columns of half a century ago. Knox hats, Cuticura soap, Worcestershire sauce, Royal baking powder were then taking their first uncertain steps which have made them household names today. Colgate's soap showed a pioneer initiative in eliminating the depression of summer trade by advertising then that "since the soap improves by age and drying, a supply laid away by families leaving the city would be found improved on their return in the fall."

There was a large advertisement in which all visitors to New York were entreated not to fail to see the electric light "now in use at Nicoll the Tailor's," and which added, further, that they possessed a telephone for customers' use and that steam machinery was used in running sewing machines and all scientific improvements. Here was merchant resourcefulness applied certainly with foresight and vision, though if today's 300,000 daily visitors to New York should attempt to see the electric light in the present shop of Nicoll the Tailor, still on Broadway, it would, of course, require the police reserves.

What the Newspapers Lacked

There were no newspaper advertisements, of course, of automobiles or accessories, the backbone of today's newspaper and magazine support; no office equipment, no sports, no apartment or office buildings, no radio, no airplanes, no public utilities, no banks with page spreads or companies offering securities in nation-wide industries, no foreign securities offered to the American financial market. There was no refrigeration, no advertisement of electric devices or gas appliances. There were no advertisements of summer resorts or hotels. Evidently the American clientèle that could travel or take vacations was too small to carry the expense of appeal.

There is an interesting sidelight in the advertisement of the elevated roads of New York, on which the traffic was made to bear what it had to, by charging ten cents fare between 5.30 and 7.30 a.m. and ten cents between 5 and 7 p.m. Between-times you could travel for a nickel. Think of the working conditions of fifty years ago, which made the morning rush hour of city transit start at 5.30 a.m. and end as early as 7.30 a.m. Those are the hours today at which you could be sure to find a seat. The evening rush hour, which then extended to 7 p.m., is today finished by 6 p.m. The shorter working day which this so vividly illustrates not only marks the conquest of extreme drudgery in daily occupation, but it is beginning to be intelligently understood by industry itself that reasonably balanced working hours and reasonable leisure, with adequate wage scales, are the very heart of universal use and buying which maintains industries themselves. In the working hours of that early day the automobile would have lacked a market, not alone for wage scales which had no margin for the purchase of such a modern-day convenience, but a working day which had no time to use or enjoy such a facility, and a working day that left little strength or energy except for bed or dissipation. As early as 1860 we had gasoline, but it was worthless, for inventions had as yet found no way to use it.

Strong Men of the Day

The pioneer industry of that day had its strong men whose names and achievements are grafted into American history. The columns teem with the names of Huntington, Harriman, Rockefeller, Carnegie, Morgan, Clark, Armour, Hill, Gould, Fiske and Cooke. The field in which these financiers laid the foundation for industrial leadership and large individual fortune was *small indeed.* The Stock Exchange recorded a turnover of 100,000 to 200,000 shares a day, against today's 5,000,000. The financial columns showed these men and others possessed of large vision and supreme daring. There run the tales of large risks assumed, success in industry development, paralleled with gigantic losses, under the standards of that time.

These straws illustrate the way in which social custom and modern industry have, step by step, developed together the earning power which has widened the range of articles of use and convenience in common possession, and have created leisure to enjoy and demand more things in everyday living. From the beginning invention has been the life-blood of suggestion, creating new articles of universal aspiration.

America was still a pioneer country with resources yet to be developed, with latent wealth still awaiting the mind and hand that could fashion it to human service. Remember that Edison's electric light was only three years behind the year of the last great tragedy of America's receding frontier in the Indian country; 1876 was the year of Custer's Last Stand, the final tragic resistance of the red Indian to the oncoming wave of American settlement. It still comes as a shock to most of us that the lives of many of this audience have spanned the period between the Indian frontier and today's complex civilization. Measured in changes of customs and habits, measured in the expansion of old industry with the miracle growth of population and buying power, measured in the rôle of new inventive industry which those early days could not even imagine, this period of fifty years stretches interminably in the imagination.

The Long Record of Time

But in the long record of Time itself, how short the span, indeed! I remember recently hearing this perspective illustrated by Charles F. Kettering, himself an inventor of international eminence. He recalled that last year Roy Chapman Andrews found in the Desert of Gobi, the heart of Asia, a great dinosaur skeleton, and the geologists looking over the strata in which it was found estimated that it had been there eighty million years—quite a long time. So they said, "It is petrified and nothing of any vitality could be existing for eighty million years." "But," added Kettering, "Harvard University had an astronomical laboratory down in Africa, and last year they photographed a nebula —a spiral nebula—and the light that affected the photographic plate in that camera last summer left its source one hundred million years ago. Light travels at the rate of 186,000 miles per second, and if you reduce 100,000,000 years to seconds and multiply the result by 186,000 miles, you have the distance in statute miles. In other words that light which affected that photographic plate last summer left its source twenty million years before the dinosaur was born."

Then Kettering goes on to point out that the human race has been conscious of itself only eight thousand years. If you could take the eight thousand years in which this human race has been conscious of itself and put it into that 100,000,000 years and stir it up and turn it over to a chemist to analyze, he would analyze that thing and report, "That looks to me like pure Time, with the exception of just a slight trace of impurity in it which we call Civilization." If you would take the two thousand years of the Christian Era and dissolve it in that 100,000,000 years, the scientist could not find even a trace of it.

The Deathless Quality of Mind

There is just one quality which man possesses which is deathless in itself and which makes the race able to look even pure Time in the face with self-respect. That is the deathless quality of Mind, the divine restlessness of intellect which explores the unchanging mysteries of Nature itself. It is the faculty which enables man to comprehend natural law and harness under that law the forces of Nature to man's service. Somewhere back in the misty days of our early race, the element of fire having been discovered by accident, there was mentality enough for the race to see that light and heat were associated by natural law together. There are today the evidences that the early cave man chipped niches in the rock walls of ancient caverns in which fire was evidently built for lighting only. Then rushes were used, soaked with grease, and splinters of resinous woods like pine; then the rush-light style of lamps in which wicks soaked up oils from an open dish. Then before the Christian Era, through centuries of experimentation, wax candles had been made from pressed honeycomb, and then the tallow candle followed. Oil lamps originated with sperm oil from the whale fisheries a century and a half after the landing at Plymouth Rock. Then some Edison of a century and a half ago developed the metal chimney which steadied the flame of an open lamp, and then came the glass chimney which made the oil lamp really practicable. Then man's intellect comprehended the possibility of controlling illuminating gas for lighting, and so good a mind as Napoleon's condemned the whole effort to substitute gas in the place of candles as a "grand folly." Sir Walter Scott ridiculed the "mad man" who proposed to light the streets of London with smoke. It was difficult in the early days to get lamp-lighters to approach the gas posts for street illumination to light the gas.

Obstacles to Progress

Less than one hundred years ago the Philadelphia Common Council received a petition against the use of gas, stating its "immense destruction of property was nearly as fatal as gunpowder."

Always the pioneers of science have had to overcome not only the mysteries of natural law, but to overcome the inertia and opposition of human intellects slower than their own. Curiously enough, too, the study of invention progress shows that invention is rarely the inspiration of a moment, but more largely the laborious product of toilsome study and experimentation. The natural law by which heat and light are inseparable, which was recognized by the caveman who built his little fire in the rocky niche to give him light, was the law which enlisted the painstaking study of Edison to find a practical light that could be carried into every nook and corner. Recognizing that light was inseparable from heat, his early experimentation was toward finding a substance so high in melting point that the heat of a current producing light would not destroy the substance itself. This early suggested carbon. It would be stimulating to the active minds of today that dread the slow, laborious process of observation to read the history of the numerous experiments of Edison to find a practicable carbon for the use of lighting. He sent explorers at great expense, over all the world for fibers. The charring of various materials runs through the whole gamut, from tissue paper, through all kinds of thread, lime, celluloid, shavings and cork; and in those early days bamboo fibers gave the best results. Learning that carbon burns in the air, his early lamps were exhausted of air by a hand-pump. It required the inventor's tenacity of purpose to carry through the early obstacles to the success which we celebrate tonight. That nature marked him early for special distinction in this field is indicated by the fact that he experimented with chemicals in his father's cellar at the age of eleven, and at fifteen possessed important books on chemistry and physics, and carried his own experimental apparatus in the baggage car on the train on which he worked as newsboy, between Port Huron and Detroit. Something divine and deathless drove him into this field in which, measured in terms of human service, he has a supreme distinction.

What Does It Profit?

We have today bewildered minds that stand by the wayside and call for the return of the good old days before machine civilization. "What does it profit a race," they say, "if living is made soft and easy, and thereby sturdy character is undermined?" "The new security of livelihood must lead to relaxed effort, to lowered standards." "What is the contribution to human welfare that we pile our great temple of industry story on story, reaching high heaven itself?" "What does it mean other than gross materialism that we invent the radio?" they say. Does it mean nothing to them that the intrepid explorers of the Polar South hold daily contact with civilization through this mysterious triumph of invention? Does this daily contact which includes even the programs of music and lighthearted entertainment from the cities they have left behind undermine the fiber of men who dare the mysterious hazards of the Arctic wastes? Do our 25,000,000 automobiles which have made the open road also the open door to health and to family picnics that replace the corner saloon, mean nothing to them except a supposed decadence of individual character? Does the miracle of the motion picture, seating its daily audience of 14,000,000 and bringing to them through eye and ear the daily news of a now contracting world, mean nothing to them in quickened intelligence, wider understanding, and the inspiration of limitless opportunity? Does the new invention of the airplane which makes every interior city a potential world port, spell to them an undermining of the qualities of personal daring and courage? Does it mean nothing to them that modern industry, developing under the profit motive, to be sure, has nevertheless made a direct contribution toward elimination of sickness and suffering, and even held death itself at bay for longer spaces?

For example, the modern refrigerator, the perfected metal and glass containers for perfectly preserved foods, the vacuum cleaner with its daily cleanliness, the automatic heater with its equably preserved temperatures of the home—these are the things, along with advances in professional knowledge, that vanquish countless human tragedies. This is illustrated by the fall in the death rate of the United States from 17 per 1000, the average of twenty years ago, to 12 per 1000, the average of these recent years. That means 600,000 less deaths per year than twenty years ago. Resolve that, if you please, into the countless homes that are thus protected against individual sorrow and desolation. Should inventive industry and the trained professional mind take no pride in 600,000 fewer death tragedies in American homes each year?

No Fear for the Sturdy Virtues

And to illustrate to you the intimate interlacing of social service and industry itself, this fall in the rate of deaths, clearly the product of improved hygiene and sanitation, is itself the basis of a universal confidence in life insurance which has directly stimulated the virtues of thrift and self-denial. The unexpected savings to these life insurance companies by a rate of death loss less than had been expected when they made their contracts years ago, constantly falling, has enlarged their resources and created a confidence in these companies, along with the lengthening record of able and trustworthy management, until our people have contracted with these private companies a total of seventy-three billion dollars of life insurance. In half the span of time which we celebrate tonight the thrift investment of our people in this after-death protection has risen from ten billion to seventy-three billion dollars. Here are private contracts many times the aggregate of all the allied debts and reparations, which through four months of negotiation for their final plan of settlement has fixed the attention of the world, although these debts and reparations rest primarily upon the entire national wealth of several great peoples. Besides these life insurance contracts which are based on the impulse of saving and the affectionate care of those who survive us, marches also the record of extraordinary growth in savings accounts. These are the indicators that dissipate any reasonable fear that easier living conditions will undermine the sturdy virtues of thrift and self-denial and affection and lead only to extravagance and thoughtless waste.

Could you imagine an Edison under any condition of modern living that would not devote his restless intellectual energy to the study of natural laws and the perfection of inventions of human service? And there are many coming Edisons of smaller stature.

Can you imagine a field of inspirational appeal that can exceed the field of modern business, ranging through invention, research and organization, when that business is conducted with high ideals as well as high standard of business efficiency?

The New Freedom

Is our civilization highly mechanized, or are we beginning for the first time in history to put a proper premium on the superiority of mind over muscle? When we equip office and workshop with invention and power that shorten the working day, has modern industry only contributed an opportunity for profitless idleness or worse? When electrical servants in the home free the afternoon of its ancient tasks, has industry done nothing more than swell the motion-picture audience or added to the window shoppers of our avenues? There is no chorus from the emancipated homes of America that the home is being mechanized, destroying the craftsmanship of former times. There is no insistence from the women of America that we return to the domestic era of the washtub, the stifling range and the dusty broom. Twenty million American homes connected for electricity evidence no inappeasable aspiration for the days of the kerosene lamp. American homes pay for kilowatt-hours, but they buy light, warmth, coolness, relief from drudgery.

So also 500,000 farms now connected with electric light and energy, are developing a new definition for the farm unit—a departure from the traditional farmstead, but a farm in which the energy of the factory will be applied to the lightening of farm drudgery as well. Modern industry and particularly the power industry has presented to all of us the priceless gift of leisure hours. Industry does not need to assume the personal responsibility for the use of those precious moments of opportunity. That responsibility rests on the individual. If we believe in democracy at all, if we trust human character at all, we must profoundly believe that, through error and misdirection, man will nevertheless learn to use this new freedom wisely.

The Basis of Social Advancement

With profound truth, Herbert Hoover said in 1924, before the World Power Conference:

"The factor that has been primarily responsible for the tremendous changes of the last century and without which modern civilization could not exist is mechanical power. The form in which in increasing degree such power is being applied is electrical energy—the greatest tool that has ever come into the hands of man. The degree to which we utilize this tool as a substitute for manual labor will largely determine the rate of our industrial and social progress. To reduce human labor, to increase its productivity, is the most profound basis of social advancement."

Within the past month the Committee on Recent Economic Changes, under the chairmanship also of Herbert Hoover, recounts the progress of the five intervening years. This report speaks of the rise in the use of power, three and three-quarter times faster than the growth in population. It emphasizes its increasing flexibility which enables it to penetrate every section of the United States, including rural areas. It speaks of the silent revolution by which through power the unskilled worker has become a skilled operator, multiplying his effectiveness. The survey states that, as a nation we now use as much electrical energy as all the rest of the world combined.

Inevitably we must analyze for ourselves the causes which lie behind pre-eminence in national progress. There is, then, not disparagement, but inspiration, for ourselves and others, when we find cause and effect securely jointed.

For example, the 60,000,000 h.p. today in America is possible because today 75 per cent of America's factories are electrified, while in Great Britain only 48 per cent are electrified. With that we find that the relative national wealth of the United States and Great Britain runs in exact ratio of the horsepower per capita used in industry, namely, 4½ to 1. With that, again, we find as between the United States and Great Britain we have twice as many owned homes, and one-twentieth as many people per capita on public charity.

Distribution of Wealth

The indicators by which our national income rises in throbbing growth until it approaches an annual one hundred billion dollars of new production, show that American industry, with its power service, increases the volume of things to divide among the homes of America. The evidence in America of equable distribution of these earnings under our political and social system rests on such indicators as its 25,000,000 automobiles and its 19,000,000 telephones. Distinctly, the average of human security is steadily advancing. The congested quarters of our cities today show the universal possession of good shoes and stockings by the children of the tenement. The wage-earner of America today may reasonably aspire to own his flivver and a savings account. The working-girl of America has established the standard of silk as the proper garb for self-supporting womanhood. The poorhouse is today echoing fewer footsteps within its sparsely tenanted halls.

History will rate America's most significant gift to civilization as its genius for revolutionary organization of industry. America's title of honor in history will rest upon the rise of average welfare under the earnings of highly organized and power-driven industry, and of a social system which distributes and shares those earnings fairly.

But, then, industry must not rest content with the progress which has been made. As long as there are still in the world men and women and children who would be happier if there were brought within their reach more and better food, more and better clothing, and until security of employment and earning power enables them to live in better homes, there is a responsibility and inspiration in this power industry which is the direct servant of all industry. All human history has accepted the concept of poverty as unavoidable. "The poor ye have with you always," has scriptural authority. Under the favor of Providence, America may reasonably hope, in the not distant future, it will have shown that poverty—except as result of individual and exceptional misfortune—may be recorded as a vanquished evil. When that day comes it will rest upon the economic law established by modern industry, directed by brains, driven by power, administered with high intelligence and high ideals. There is a peculiar responsibility resting on this electrical industry. It asks from public regulation, fair and generous treatment and understanding, and it

(*Continued on page 428*)

Amplifier Considers Industrial Migration

By AMPLIFIER

THE other day a good friend of mine, whose name is known to every executive of every central station in the country, handed me a large and somewhat heavy manilla envelope, saying: "Here are some galley proofs of a special report which I would like to have you look over and tell me what you think of the story. Arriving home, I opened it up, only to be greeted with the words INDUSTRIAL DEVELOPMENT IN THE UNITED STATES AND CANADA at the top of the first galley.

Almost at once I was enveloped in an atmosphere of deep gloom. It settled down like one of those blanketing London fogs which always happen along when you have missed your boat and have to spend Thanksgiving Day in England. I looked up at a bookcase near my desk only to see a long row of depressing volumes bound in that dingy red which seems to be a favorite color of the United States Printing Office, and labeled "Thirteenth Census of the United States." Volumes 8, 9 and 10 bear the subtitle "Manufacturers."

NO doubt there is a splendid reason for the immortalization of the enormous amount of statistical data entombed in those volumes, and I suppose that there are a lot of folks who resurrect them periodically and use them to good advantage, but why anyone should write a piece entitled "Industrial Development in the United States and Canada" to the extent of some 75 or 100 galleys and why it should be handed to me to read on a hot summer night was, for the moment, beyond my comprehension.

Glancing over these proofs in a gingerly fashion, I began to get interested. Here was something new. This was not a census bureau story filled with endless tables of statistics and graphs depicting the history of this or that industry during the past ten years. Almost immediately I found that it was a story of American and Canadian communities—why old industries moved from here to there and why new industries select particular locations in which to establish themselves. Having read it through, I can, without the slightest hesitation, commend it to careful consideration of every city official, every chamber of commerce, every luncheon club and every booster organization in the United States. It will tell them many things not dreamed of by the average citizen interested in the growth of his home town whether it be a great metropolitan center or a small inland community.

As nearly as I can make out, the Civic Development Committee of the National Electric Light Association set out to find what makes some communities progress industrially while others either stand still or go backward, and almost immediately found that no comprehensive reliable data was available from any source; enough to discourage any committee. This outfit, however, turned to the Metropolitan Life Insurance Company with the knowledge, according to a letter from P. S. Arkwright to James L. Madden, third vice-president of the Metropolitan, "that your company had made very extensive investigations in such matters and that your facilities for collecting and classifying such economic data were extremely well organized, at the same time assuring you of the cooperation of the Association (N. E. L. A.). We also recognized the fact that the nation-wide interest of your company placed you in a position to make a fair and unbiased investigation of such a subject, without which, such an investigation might not be inclusive or receive general confidence."

APPARENTLY the idea appealed to Mr. Madden and the Metropolitan Company. At least their interest was sufficient to produce a remarkable document on what some people might call "The Migration of Industry," but which, because there is so little migration in it, I would call "The Location and Relocation of Industrial Establishments and Why" as more descriptive. It covers a survey of 2084 communities in the United States and Canada comprising 75 per cent of the urban population of this country and about two-thirds of the urban population of our Northern neighbor. It is based on information obtained from chambers of commerce, public utility companies, railroads, banks and miscellaneous sources, including mayors of cities, postmasters, real estate companies and other contacts. To check the information received from these sources, a letter was written to every industrial establishment mentioned. In fact, the whole job was done with all of the thoroughness of the Metropolitan in writing a new life insurance policy or paying a loss on an old one.

The most striking thing about this report which, to use a somewhat hackneyed phrase, "sticks out like a sore thumb," is the established fact that there isn't so much to this so-called "migration of industry" as some people seem to think. Industry is not picking itself up annually and moving around the country like a tenant trying to beat his landlord out of the rent. During the two-year period covered by the survey (1927-1928) 1934 communities in the United States gained 10,267 plants employing 371,334 workers. Of this number no less than 8400 establishments were brand new industries established within the communities. Only 964 represented plants moving from one city to another, while 903 were branches of existing industries.

THE next striking thing about the information obtained is that while these 1934 American communities gained 10,267 new industrial establishments during the two year period they lost, in that time, 5908 plants. Of this number 1047 moved away and 4861 went out of business. It would seem that chambers of commerce, anxious to see their communities progress industrially, might equally as well turn their attention to the reasons why establishments move away or go out of business. Personally, it seems to me that a community should take care of what it has before reaching out for something belonging to some other community and, getting it, find that it has done so only at the expense of the home industry which is already established. The banks, the public utilities and the business interests of any city have a distinct obligation to existing business enterprises which must precede any obligation to a program of expansion.

A third interesting feature established by the survey is the fact that offers of bonuses, free land, free buildings and free taxes apparently play little or no part in the reasons given for the location of plants. After all, no business can survive and prosper on subsidies alone, and the replies to the questionnaire sent out show very clearly that this sort of thing either received no consideration, or so little consideration that it can be said to be negligible as a factor in the development of any community.

What, then, are the factors most commonly influencing the selection of a particular site for a plant? Without doubt a plentiful supply of dependable cheap power is of the greatest importance. Yet, because the prevalence of cheap electric power almost anywhere in the United States where there are anything resembling markets for industrial products is so well known it has become commonplace. In the ranking of reasons for the United States as a whole, power is given seventh position in the answers received from the reporting communities. It is a well-known fact that today there is not a single community in the country of 1000 population or over without electric service, and the manufacturer, seeking a home for his business, brushes the question of power aside as a question he need not ask knowing that if other conditions necessary to a successful undertaking exist the power must be there.

Outstanding reasons given for the selection of sites were transportation, labor and markets. "In many instances," says the report, "there was evidence of a close relationship existing between the factors of transportation and markets. As might be inferred, these do not represent distinct reasons, but are, rather, different aspects of the same thing, i.e., ability to serve markets. Thus, this factor and favorable labor conditions were the outstanding reasons determining the selection of a plant site."

SUMMARIZING the establishment of industries in relation to size of cities, the bulk of the gains seem to go to the large cities. This is principally due to the large number of "satellite" industries, classified in the survey as new industries, starting up in the larger cities around established industries. An analysis of the distribution of plants by three classifications shows that one-half the relocations, one-half the branches, and over three-fourths of the new industries were established in cities of over 50,000 population. However, the greater part of the movement out of cities and of the firms going out of business was reported from the larger cities. Two-thirds of the plants which moved away and more than four-fifths of the plants going out of business were reported by cities of 50,000 population or over.

Approaching the subject from the standpoint of "trends of industrial movement," it was found that the textile industry accounts for 25 per cent of the relocation. The machinery group accounted for 15 per cent, the iron and steel group for 8 per cent, the lumber group 8 per cent, and the leather group 7 per cent. Of the 8401 new industries reported, considerably more than one-half were in the Middle Atlantic States. Of the total number, the textile group accounted for 22 per cent, the paper and printing group for 10 per cent, the food group 9 per cent, the lumber group 7 per cent and the leather group 6 per cent. In the miscellaneous group were reported 1,190 plants, of which 700 were in the fur industry in New York.

In the above I have made no effort to review the report of this survey in detail—I have tried only to indicate its great value by pointing out some of the important features which indicate the trend of industrial movement. The data gathered is analyzed geographically, by industries, by numbers of employees gained or lost and by sizes of communities. It should be of decidedly more than passing interest to every business man who depends for an increase in his prosperity on an increase in the prosperity of his city or town.

If the report did nothing else, the fact that it indicates the need for some permanent machinery to carry on such a survey from year to year would be sufficient to justify it. There is no such machinery at present. It has been suggested that the U. S. Department of Commerce might very well consider taking on this work as part of its regular function of serving American industry. It is to be hoped that this suggestion will receive serious consideration on the part of the proper authorities.

Common Sense and Electricity

Safety Rules for the User of Electricity

THE Accident Prevention Committee has prepared for the use of member companies ten common sense rules designed to answer the more important questions arising in the householder's mind with respect to the proper handling of things electrical on his premises. These rules have been reproduced in pamphlet form by the Association.

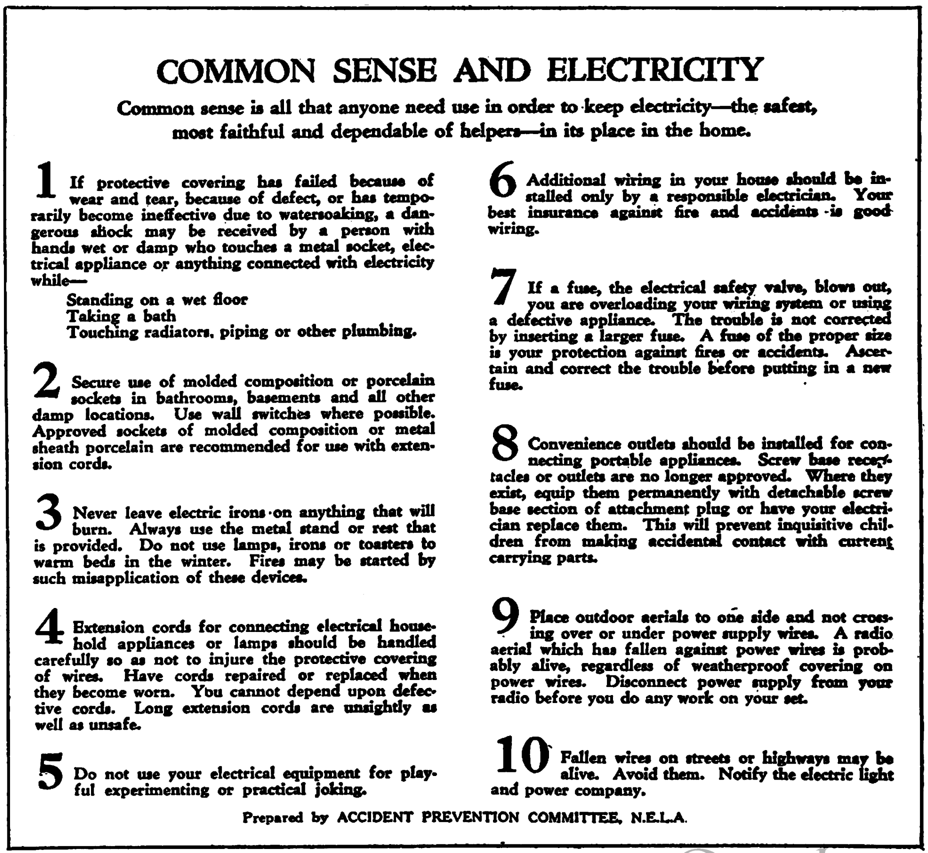
The inside pages of this pamphlet are reproduced herewith. Space is left on back cover page for local company imprint or message. The pamphlet folds to fit ordinary envelopes. A considerable number of companies have ordered stocks for distribution to all consumers with bills.

While many companies may wish to provide their own printings of these rules, N. E. L. A. Headquarters will accept orders at the following rates:

Less than ten thousand, $7.50 per thousand.

Ten to twenty thousand, $6.00 per thousand.

Special prices for larger quantities.



COMMON SENSE AND ELECTRICITY

Common sense is all that anyone need use in order to keep electricity—the safest, most faithful and dependable of helpers—in its place in the home.

1 If protective covering has failed because of wear and tear, because of defect, or has temporarily become ineffective due to watersoaking, a dangerous shock may be received by a person with hands wet or damp who touches a metal socket, electrical appliance or anything connected with electricity while—

Standing on a wet floor
Taking a bath
Touching radiators, piping or other plumbing.

2 Secure use of molded composition or porcelain sockets in bathrooms, basements and all other damp locations. Use wall switches where possible. Approved sockets of molded composition or metal sheath porcelain are recommended for use with extension cords.

3 Never leave electric irons on anything that will burn. Always use the metal stand or rest that is provided. Do not use lamps, irons or toasters to warm beds in the winter. Fires may be started by such misapplication of these devices.

4 Extension cords for connecting electrical household appliances or lamps should be handled carefully so as not to injure the protective covering of wires. Have cords repaired or replaced when they become worn. You cannot depend upon defective cords. Long extension cords are unsightly as well as unsafe.

5 Do not use your electrical equipment for playful experimenting or practical joking.

6 Additional wiring in your house should be installed only by a responsible electrician. Your best insurance against fire and accidents is good wiring.

7 If a fuse, the electrical safety valve, blows out, you are overloading your wiring system or using a defective appliance. The trouble is not corrected by inserting a larger fuse. A fuse of the proper size is your protection against fires or accidents. Ascertain and correct the trouble before putting in a new fuse.

8 Convenience outlets should be installed for connecting portable appliances. Screw base receptacles or outlets are no longer approved. Where they exist, equip them permanently with detachable screw base section of attachment plug or have your electrician replace them. This will prevent inquisitive children from making accidental contact with current carrying parts.

9 Place outdoor aerials to one side and not crossing over or under power supply wires. A radio aerial which has fallen against power wires is probably alive, regardless of weatherproof covering on power wires. Disconnect power supply from your radio before you do any work on your set.

10 Fallen wires on streets or highways may be alive. Avoid them. Notify the electric light and power company.

Prepared by ACCIDENT PREVENTION COMMITTEE, N.E.L.A.

Behind the Veil

*The First Civilized American**

By ERNEST GREENWOOD

The fourth of a series of articles portraying, against a social historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

THE PATH of the historian is surely a difficult one, full of pitfalls, dangerous curves, sand traps and a great variety of obstacles, designed to leave him, at the end of his journey, mentally foot-sort and weary—wondering, perchance, if the establishment of records for present or future generations is worth the doing thereof. Like the bibliographer, he must realize sooner or later that "of the making of books there is no end," and that, while history itself may have a beginning which is finite in date, the incidents which he attempts to record chronologically as the beginnings of new eras are little more than milestones reminding him that men may have been thinking the same thoughts and erecting similar milestones hundreds, or even thousands, of years before.

I had thought, when I finished the preceding installment of this series with a description of the experiments of Von Guericke, that, after duly noting the work of Francis Hauksbee, Stephen Grey, Charles du Fay and Bishop von Kleist, who discovered the principle of the Leyden jar (?), I could jump at once to our own Benjamin Franklin who, to quote the N. E. L. A. Handbook, "made the immortal discovery with his silken kite that lightning and the artificial discharge from the Leyden jar are identical." I even had some idea that I was going to be able to say with Humboldt (Cosmos, Vol. II, page 727) that "from this period the electric process passes from the domain of speculative physics into that of cosmical contemplation—from the recesses of the study to the freedom of nature." I must insist that that phrase is a most erudite summing up and one of which any historian might well be proud, even though borrowed from a predecessor.

But I find I cannot do so if I am to maintain the integrity of this account. The good Benjamin may have established the identity of electricity and lightning by an experiment which has appealed to the dramatic instincts of succeeding generations, but he was by no means the first to have such an idea or to think of the possibility of "lightning rods" as a protection against this strange and little understood force of nature. Moses, born more than 3300 years before Franklin, is supposed to have had some knowledge of the phenomena of electricity. Michaelis remarks that "there is no indication that lightning ever struck the Temple of Jerusalem during a thousand years; that, according to Josephus, a forest of points, gold and very sharp, covered the roof of the temple, and that this roof communicated with the caverns in the hill by means of pipes in connection with the gilding which covered all the exterior of the building, in consequence of which the points would act as conductors."

The roof of King Solomon's Temple has numerous points distributed over it which "effectively served as lightning conductors." The Etruscans (about 600 B.C.) are said to have attracted lightning by shooting arrows of metal into clouds which threatened thunder. Pliny asserts that they had a secret method of not only "drawing it down" from the clouds but of afterwards "turning it aside" in any desired direction.

Tradition says that "Numa Pompilius, the second king of Rome, was initiated by the priests of the Etruscan divinities and instructed by them in the secret of forcing Jupiter, the Thunderer, to descend upon earth." Salverte believed that "before Franklin discovered his refined electricity. Numa had experimented with it most successfully, and that Tullus Hostilius, the successor of Numa, was the first victim of the dangerous 'heavenly guest' recorded in history." Salverte also asserts that in the days of Ctesias (Ktesias) India was acquainted with the use of conductors of lightning.

So to say that Franklin established the identity of electricity and lightning, and that he invented the lightning rod, is like saying that Thales invented electrical attraction, that Leonardo invented the principle of the present day airplane, that Edison "invented" the principle of the incandescent lamp, or that Sidney Z. Mitchell "invented" the financial principles on which holding and management companies are based. What he did do, however, was to recognize something which had been a matter of speculation for centuries and then demonstrate, for all time, the truth of this speculation, which was that lightning and electricity are identical; out

BENJAMIN FRANKLIN

---

* The author thanks Mr. Phillips Russell who, in his biography of Benjamin Franklin, designated him as "The First Civilized American."

of his demonstration the world obtained the first *practical* results of electrical experimentation.

Before any more time is devoted to Franklin, however, there are certain historical threads which must be caught up and woven into the fabric of this account if our tapestry is not to have a rather moth-eaten appearance at that section, supposed to represent the period between Gilbert and the philosopher of Philadelphia. Some time after Von Guericke's discovery that electricity could be transmitted (1705 to be exact), an Englishman by the name of Francis Hauksbee constructed a powerful electrical machine wherein the Von Guericke sulphur globe was replaced by one of glass. With it he found "upon exhausting the air, whirling the globe rapidly and placing his hand upon the outside, a strong light appeared upon the interior, and that the light would show itself also upon the outside when air was let into the globe." Here again we find a man given credit for doing something which had been done years before. In 1675 Sir Isaac Newton had not only done exactly the same thing, but in a measure (as shown by his correspondence) anticipated Franklin's discovery of the identity of lightning with electricity.

IT was left for Dr. William Well, a prominent English divine, to definitely establish the resemblance of electricity to thunder and lightning insofar as comparative modern literature on the subject is concerned. In 1708 he reported to the Royal Society the results of certain experiments consisting of rubbing a large bar of amber against woolen cloths. He stated that "a prodigious number of little cracklings was heard, every one of which produced a small flash of light; and that when the amber was drawn lightly through the cloth it produced a spark but not crackling," and also observed that "by holding a finger at a little distance from the amber a crackling is produced, with a great flash of light succeeding it, and, what is very surprising, on its eruption it strikes the finger very sensibly, wheresoever applied, with a push or puff like wind. The crackling is fully as loud as that of charcoal on fire. . . . This light and crackling seem in some degree to represent thunder and lightning."

While Von Guericke established the principle that electricity could be transmitted, it seems, so far as I am able to find out, that Stephen Grey, a fellow of the Royal Society, should receive the credit for the investigations which finally led to the discovery of the principle of electric conduction and insulation as well as to the fact—not the principle—of induction. According to Mottelay, he "laid the foundation of electricity as a science." He proved that electricity can be excited by the friction of feathers, hair, linen, paper, silk, etc., all of which attract light bodies even at a distance of 8 or 10 inches. He next discovered that electricity can be communicated from excited bodies to bodies incapable of ready excitation. When first suspending a hempen line with pack threads, he could not transmit electricity, but when suspending the line with silken threads he transmitted the electrical influence several hundred feet."

The idea of suspending his "line" with silken threads he obtained from his friend Granville Wheeler (not Checler, as some historians have it). Wheeler thought that silk would be much better than pack thread because it was smaller and less of the "virtue" (electricity) would probably pass off. By June, 1729, Grey and Wheeler succeeded in passing electricity through pack thread supported by silken cords a distance of 765 feet and through a wire a distance of more than 800 feet. In 1726, however, three years before this, John Wood, an English architect, is said to have shown that electricity could be conveyed "through wires a long distance," and in 1747 William Watson applying Wood's discoveries extended his experiments over a distance of four miles, a circuit of two miles of wire and two miles of ground.

THE year 1745 was to witness a discovery which Professor Tyndall says "throws all former ones in the shade" and which Dr. Priestly calls "the most surprising yet made in the business of electricity." This was the invention of the Leyden jar, or rather the discovery that electric power could be accumulated in a glass phial.

Just who invented the Leyden jar will probably never be decided. The N. E. L. A. Handbook credits it to Bishop von Kleist, dean of the Cathedral of Comin, Pomerania, but the invention is also claimed for Pieter Musschenbroek, the celebrated professor, and also for Cunæus, a rich burgess of Leyden. Mottelay says that the discovery was first announced "in a letter *to* von Kleist dated the 4th of November, 1745, and addressed to Dr. Lieberkuhn, who communicated it to the Berlin Academy." I think this is a typographical error, and that Mottelay meant to say it was communicated in a letter *from* von Kleist, for the evidence is that he was the first to publish the discovery. However, his explanations were most obscure, and not only Dr. Lieberkuhn but various other scientists to whom von Kleist wrote all returned word that the experiment did not succeed with them. The Abbe Nollet in a letter to Samuel Wolfe, dated March 9, 1946, says that "the experiment at Leyden was upon principles similar to that made with a phial half full of water and a nail dipped in it; and that this discovery would have been called the Danzig experiment if it had not happened to have got the name of that of Leyden."

About this time Dr. William Watson—a most distinguished name in this period of the history of electricity—like most scientists at that time made numerous experiments with the Leyden jar and is said to be the first to observe the flash of light attending its discharge. He, himself, says: "When the phial is well electrified and you apply your hand thereto, you see the fire flash from the outside of the glass wherever you touch it, and it crackles in your hand." He directed a series of experiments which eventually proved "the instantaneous transmission of the fluid." Regarding these experiments, Professor Musschenbroek wrote to Dr. Watson, *"Magnificentissimis tuis experimentis superasti conatus omnium."*

All of which brings us up once more to our own Benjamin Franklin because, as Mottelay tells us, Watson's experiments were repeated, "notably by Franklin" at Philadelphia in 1748. Benjamin first began thinking about electricity in 1745, but it is not until 1752 that we find any record of his own of the famous kite experiment which proved a fact that had been pointed out by many scientists before him.

AS a caption for this chapter I have written "The First Civilized American." I admit that I borrowed the phrase from Phillips Russell, but that doesn't make it any the less apt. Just what were the affairs of the world when Franklin was born? Was it the end of the fourth act or the beginning of the fifth in the drama of civilization? Let us see.

In 1706, the year of Franklin's birth, Queen Anne was sitting on the throne of England. During that year Daniel Defoe published in London his *Juno Divino*. It bore this significant dedication: "To the most Serene, most Invincible, and most Illustrious Lady, REASON." This, as a matter of fact, was the keynote of the Eighteenth Century, when "it was firmly believed that henceforth Reason was to govern all human emotions." Men in those days might still flatter monarchs just as men today flatter presidents, but in their hearts they were questioning the divine right of kings just as we question today the divine right of bureaucrats in Washington. Sixteen years before Franklin was born, John Locke had published his "Essay on Human Understanding," and while the young Benjamin was cutting candle wicks in his father's shop the great Voltaire was serving a sentence in the Bastille for writings objectionable to the authorities. When he was only six years old, Jean Jacques Rousseau, who was to lay down the disturbing principle that all governments must be based on the consent of the governed, was born, while Frederick the Great, of Prussia, who taught the theory that a king is the first servant of the people, saw the light of day at about the same time. As Russell tells us "new forces, uncomfortable theories and undreamed of discoveries were making themselves felt. Newton had already established a novel science of theoretical mechanics; Watt was shortly to discover the steam engine; Spinoza had written a new philosophy in Holland, and the skeptical writings of Lord Shaftesbury and Anthony Collins were finding an ever-widening circle of readers. Men felt an uneasiness of the spirit without knowing its origin, for the flowers of authoritarian evil had not yet bloomed."

LONG afterward Henry Adams wrote, concerning this century: "Evidently a new variety of mind had appeared . . . not one considerable man of science dared face the stream of thought; and the whole number of those who acted, like Franklin, as electric conductors of the new forces from nature to men, down to the year 1800, did not exceed a few score, confined to a few towns in Western Europe. Asia refused to be touched by the stream, and America, except for Franklin, stood outside." What did Adams mean by saying that "America stood outside?" Suppose we turn again to Russell.

"At the time when the infant Franklin was uttering his first cry, the most conspicuous writer in the American colonies was the Rev. Cotton Mather. While teachers in other lands were urging men to listen to the voice of reason, he was calling on the faithful to beware of witches. Only a few years before Franklin's birth, the mischief set afoot by eight silly and illiterate Massachusetts girls, who used to meet and giggle hysterically in the dark of the moon, had reached a maniacal climax, in the Salem witch persecution of 1692. Cotton's father, Increase Mather, and Solomon Stoddart were meantime issuing pamphlets of quarrelsome theology dealing with such questions as these:

"Is it lawful to wear long hair?"

"At what time of evening does the Sabbath begin?"

"Can baptized persons destitute of religion come to the table of the Lord?"

"The ten American colonies, containing less than half a million inhabitants all told, were perched timidly on the rim of the Atlantic Ocean, the shore of which was the nearest thing to England. Loosely strung settlements hung southward from Boston, divided from each other by vast tracts of lonely land traversed at intervals by dim trails and gully-washed roads. Boston, with 10,000 inhabitants, regarded itself as a bustling city, but near the Old South Church still stood the village pillory and stocks. Probably nowhere in New England did men or women go to bed at night with minds at ease, for the shadows cast by the Indian-haunted forests on sparsely yielding fields were deepened by that which overhung the spirits of the people. The Mathers and their kind, disagreeing with St. John, taught by precept and example that God was Fear. Fears huddled in the corners of human hearts, and toil and uneasiness imparted that grimness to the human countenance which is pathetically evident in early American portraits."

The early life of Franklin is too well known to receive but scant attention here. He did not do particularly well in school and was antagonistic toward his father's beliefs and leanings. Woodrow Wilson has said that he was half peasant and half man of the world. He spent the whole of his leisure time among books and at one time decided to be a poet; his father, however, believing that verse-makers are "generally beggars," insisted that he "stick to business," and, as Benjamin wrote at the age of 65, "I escaped being a poet, most probably a very bad one."

WHEN Franklin was 15 years old, his brother James started a newspaper, the *New England Courant,* which was actually the fourth newspaper to be established in America, although Franklin, in his autobiography, speaks of it as the second. The two Franklin boys managed to produce a sheet which was denounced by the very Rev. Cotton Mather as "full freighted with nonsense, unmanliness, raillery, profaneness, immorality, arrogance, calumnies, lies, contradictions and what not all tending to quarrels and divisions and to debauch and corrupt the minds and manners of New England." Brushing aside the quaint phraseology of that day there is something strangely familiar about the charge. Certain types of politicians today have said something of this sort about news stories and editorials which are not to their liking.

Eventually the *New England Courant* was suppressed by the authorities with an order forbidding James Franklin "to print or publish the *New England Courant,* or any other pamphlet or paper of the like nature, except it be first supervised by the Secretary of this Province." The psychology of many of our present-day lawmakers seems to have a well established historical background.

There is no doubt but what Franklin belonged to that little group which possessed a "new variety of mind." He had but little religion and did about as he pleased, for, as he remarked at one time in his life, "so convenient it is to be a reasonable creature, since it enables one to find or make a reason for everything one has a mind to do." He drifted from Boston to Philadelphia, then to London, then back again, until he finally became established as a solid citizen engaged in the printing business, but always reading, reading, reading.

FRANKLIN'S attention was first directed to electrical studies in 1745, by a letter from Peter Collinson, Fellow of the Royal Society of London, to the Literary Society of Philadelphia, and he first wrote on the subject to that gentleman on the 28th of July, 1747. This was followed by several other similar communications up to April 18, 1754, the whole of which comprise most of what subsequently appeared under the title "New Experiments and Observations on Electricity, Made at Philadelphia, in America, by Benjamin Franklin, LL.D. and F.R.S."

The kite experiment is well worth recording in Franklin's own language. In a letter dated Oct. 19, 1752, he says:

"Make a small cross of two light strips of cedar, the arms so long as to reach to the four corners of a large thin silk handkerchief when extended. Tie the corners of the handkerchief to the extremities of the cross, so you have the body of a kite which, being properly accommodated with a tail, loop and string, will rise in the air like those made of paper; but, this being made of silk, is fitter to bear the wet and wind of a thunder-gust without tearing. To the top of the upright stick of the cross is to be fixed a very sharp-pointed wire, rising a foot or more above the wood. In the end of the twine, next the hand, is to be held a silk ribbon, and where the silk and twine join a key may be fastened. This kite is to be raised when a thunder-gust appears to be coming on, and the person who holds the string must stand within a door or window, or under some cover, so that the silk ribbon may not be wet, and care must be taken that the twine does not touch the frame of the door or window. As soon as any of the thunder clouds come over the kite, the pointed wire will draw the electric fire from them, and the kite with all the twine will be electrified, and the loose filaments of the twine will stand out every way and be attracted by an approaching finger. And when the rain has wetted the kite so that it can conduct the electric fire freely, you will find it stream out plentifully from the key on the approach of your knuckle. At this key, the phial (Ley-

The Code Situation

Addresses made at the Chicago Conference of Company Code Representatives

RELATION OF CODES AND STANDARDS TO POWER SYSTEM ENGINEERING

By E. C. STONE

Chairman, Engineering National Section N. E. L. A.

EDITOR'S NOTE: The reader is referred to page 368 of the June N. E. L. A. BULLETIN for the addresses of Judge O. B. Ryon, Consulting Counsel of the National Board of Fire Underwriters, Irvin W. Day, Chairman of the Codes and Standards Committee, N. E. L. A., and Marshall E. Sampsell, Chairman of the Commercial National Section, N. E. L. A., made at the Chicago Conference on March 18 and 19. A general report of this meeting will be found on page 302 of the May BULLETIN.

CODES and standards are frequently grouped together, perhaps because in many cases they are treated in a similar manner. In fact, however, the two words have quite different meanings.

By definition a standard is a type, model or example for comparison. In practice any fixed quality or type of material or apparatus used in the power system, or any method or manner of grouping and applying materials and apparatus in the system for application in generation, transmission or utilization, or any specified method of design or construction, or practice or procedure, or set of rules and regulations governing them may be established as a standard by official edict or general consent and use. In general, adopted standards are based on long and broad experience in practice, through which a high degree of adaptability of the standard to its use has been established.

On the other hand, a code by definition is a system of rules and regulations. Hence it may be said that all codes should be standards, but not that all standards should be codes. In other words, codes constitute one of many classes of standards. At the moment, however, it is codes with which we wish to deal.

In the power industry codes of major interest are systems of rules and regulations which are compiled for the purpose of controlling the hazards to life and property involved in the generation, distribution and utilization of electrical energy, and are sponsored by interests outside of the power industry. Two of these codes are of major importance, the National Electrical Code covering interior wiring and sponsored by the National Fire Protection Association, and the National Electrical Safety Code covering electrical generation, transmission, and distribution plant, and sponsored by the United States Bureau of Standards. Normally both of these codes are established as national standards through the procedure and authority of the American Standards Association. The National Electrical Code, because of its sponsorship, is naturally concerned primarily with fire risks, but in recent years, in order to improve its availability as a complete standard for interior wiring, it has dealt to some extent with personal hazards associated with interior wiring. On the other hand, the National Electrical Safety Code is concerned primarily with life hazards. In the case of both codes, because of their sponsorship by interests outside the industry, we find ourselves constantly on the defensive in respect to what is to be included within the codes.

FROM time to time attempts have been made by other interests to compile and enforce other codes dealing with electrical hazards. The National Electric Light Association, however, desires to recognize only the two major codes above referred to in the electrical field.

The engineer's interest in codes and standards lies in the effect which they may have on the costs of design, construction, and operation of the plant for which he is responsible. Money expended for the reduction of hazards must bring about a real reduction commensurate with the amount spent. Hazards to property in general result in destruction by fire and storm, or interruptions to service, and are controlled more or less automatically by the cost of fire insurance and the requirements for continuity of electric service to customers. In other words, the costs of these risks may be determined quite definitely, so that the expenditures justified to reduce or eliminate them are measured.

Hazards to life, however, are more difficult of reasonable treatment because of the humanitarian sentiment involved and the intangibility of many of the costs resulting from accidents to persons. In addition to the direct costs of accidents, either to employees of power companies or to others, which result from damages, compensations, destruction of property, and loss of service caused by such accidents, there are the intangible costs created by the effect of accidents on the morale of the employees and on public opinion. It is probable that in this problem, as in many others, public opinion is the final barometer by which the standards are set. While it is true that the public has pretty generally made up its mind that human life is priceless so far as the responsibility of industrial and public utility corporations is concerned, it does not apply the principle to itself. The average man or woman takes risks about the home, on the street, in automobile driving, and so on, far greater than those risks which are considered proper in corporation activities. Furthermore, it is very evident that the public would be extremely quick to reflect its disapproval of unreasonable and costly provisions for safety, if such provisions resulted in materially higher cost of service, by a curtailment of its use of the products or service of such corporations. From these points of view some measure can be made of the public's attitude toward accident prevention.

In this connection, it is interesting to note the small proportion which electrical accidents bear to all accidents. In the booklet "Accident Facts," published by the National Safety Council, it is stated that during 1927 over an average population of 20,000,000, there were 50 fatal electrical accidents in the home out of a total of 2437 accidents of all kinds, of which 792 were from falls. The fatalities in the home from electricity in this section of the population were thus 1 per 400,000, while the fatalities from falls were 1 in only 25,000, or 16 times as numerous. In the same year there were 9409 fatal motor vehicle accidents in a population of 45,000,000, or approximately 1 per 5000 of population. The motor vehicle risk is thus 80 times the electrical risk to the user of either, and yet it is accepted by practically everyone.

Likewise in industry, the electrical accidents constitute a very small proportion of the total. As an example, the September issue of *Labor and Industry,* published by the Pennsylvania Department of Labor and Industry, reports for July a total of 142 fatal accidents which occurred during the course of employment in all industries in the state, but of these only 11 are chargeable to electricity, while 37 are chargeable to falling objects and 22 to cars and engines. We may conclude from these figures that the use of electricity is very safe comparatively, and the risk taken in using it far less than many other risks that are taken by all of us every day. We must give full weight to these facts in determining the standards of safety that are to be set for our industry.

It will be admitted that 100 per cent accident prevention can be obtained in the present state of human development only by complete cessation of human activity, even with unlimited expenditures of money for preventive measures. The engineer's ideal, therefore, will be to design, construct and operate with the least hazards reasonably possible. As already stated, money spent to reduce hazards must bring results commensurate with the expenditure. The results to be expected from a given expenditure are often difficult to predict, but all of the possible knowledge from experience should be made full use of through careful analysis of the cause and frequency of past accidents and of current accidents as they occur. It is necessary to give weight to the frequency of accidents from a given cause, as well as to the seriousness of the accident when it occurs. Thus certain classes of accidents, such as those resulting from stumbling, handling tools, and so on, are often unimportant individually, but because of their frequent occurrence accumulatively involve a loss of serious proportions which justifies taking comprehensive measures for prevention. On the other hand, accidents occur now and then of a very serious nature, resulting in fatality. In some cases, however, these accidents are so unusual, and involve such a peculiar combination of circumstances, that it would be entirely impracticable to apply preventive measures. An example from another industry may be cited. Trunk line railroads build two to four main line tracks quite close together on their rights-of-way. It is a generally known fact that long freight trains occasionally buckle, spreading some of their cars over one or more of the adjacent tracks. If another train is on the adjacent track at the moment of the accident or shortly thereafter, a very serious and probably fatal wreck will result. Nevertheless, this risk is accepted as a necessary one both by the railroad operators and the public because the chance of the combination of circumstances necessary to produce the fatal wreck is so extremely remote. In other words, the law of probability applies here, as everywhere else. The percentage of time during which any particular point on a track is occupied by a train is very small, so that the probability of two trains being together at the same point at the time of a wreck of one is almost nil. The probability of such accident is further kept down by careful inspection and maintenance of the braking system and skillful application of brakes, by effective block signaling, and other operating precautions. Nevertheless, because the hazard exists some might claim that multiple tracks should be so widely separated as to make accidents of this nature impossible—a solution that obviously would bankrupt the railroads. Similar situations exist in the power systems, particularly in respect to the conditions surrounding the operation of overhead circuits in the streets.

THE engineer, in dealing with accident hazards must take account of the fact that accidents are due to unsafe practices and lapses in human responsibility, as well as to unsafe plant conditions. There must be full cooperation between design and operating engineers so that the rules and regulations set up to govern employees and to protect the public in the hazards of electrical power systems are carefully and completely worked out and rigidly enforced. The design engineer will take care of the hazards through provision for adequate electrical and mechanical factors of safety, proper clearances and proper barriers for dangerous parts of the plant, and appropriate provisions for safe operation through the installation of suitable interlocks and other safety devices. The operating engineer will provide efficient maintenance for plant, and set up regulations governing the movements of his men in safe manner.

Our conclusion is, therefore, that codes for the control of hazards in our industry, both property and life hazards, must ultimately be based on a balance between the savings in accident cost by reduction of hazards compared with the cost of reducing them, with due regard for a just and reasonable public opinion. The other fundamental principle involved in code making is that code provisions must be based on well-accepted practice, the practical effect of which in use is well understood, and that experimental or unaccepted practices must not be included in codes. A major reason for the objection of the N. E. L. A. to the provisions of Article IX on Grounding of the 1928 edition of the National Electrical code was that new principles and new methods were rigidly set up as standards without having been given a trial in service to determine their effectiveness. Furthermore, it seems of fundamental importance that code provisions be based on facts and sound economic and engineering principles. If the economic requirements of codes are unsound, the progress of the industry will be retarded through the introduction of unjustifiable elements of cost into electric service and through the doing of injustice to some of those engaged in rendering service to the industry.

Recent N. E. L. A. Serial Reports are listed on inside page of back cover

Thus it is found that expenditures for reduction in hazards, whether to service, life or property, must bring results commensurate with the magnitude of the expenditure. While, on the one hand, we must accept the principle that it is not feasible to prevent all accidents, on the other hand it is equally essential that we recognize the full and complete cost of accidents, not only in direct costs but also in the more tangible but none the less real costs involved in their effect on organization, morale and public opinion.

This group is composed of those who have been appointed by their respective companies to handle code matters locally. From the engineering standpoint it is recommended that the following activities be covered in the work which they will do:

1. Become familiar thoroughly and in detail with all of the provisions of the codes of interest to them, particularly the National Electrical Code and the National Electrical Safety Code.
2. Study the effect on their respective organizations and physical plants of the various code provisions, both from the point of view of cost involved in complying with them and the results attained in reduction of hazards.
3. Investigate proposed new code provisions from the point of view of their local conditions, and be prepared to make recommendations. In considering new rules, full consideration should be given to possible savings in cost through reductions in hazards to life and property, improvements to electric service rendered customers, and improved public opinion.
4. Make a thoroughgoing analysis of past experience, as far as information is available in order to know with some degree of certainty the results of present practices and to provide a starting point for future work.

COMMENTS ON THE NATIONAL ELECTRICAL CODE

By A. R. SMALL

Chairman, Electrical Committee, N. F. P. A. and Vice-president of the Underwriters Laboratories

ABOUT three years ago I wrote an article for the magazine *The Electragist,* which had this opening paragraph:

> "During its thirty-year history, the National Electrical Code has been the product of the meeting of minds of representative of national bodies concerned in its field of application. This fact is the primary force responsible for the status of the Code throughout the land and for the very general recognition and support accorded its provisions by regulatory bodies, municipal or other, and by the producers and users of electricity. It is impossible to calculate the assistance this cooperation has given the growth in recognition and application of the use of electricity for light, heat and power within buildings which the public has encouraged and permitted in the period."

The article then proceeded to outline in full detail the organization and the procedure of the Electrical Committee and of an individual wishing a change in the Code requirements.

From its inception the National Electrical Code has sought to safeguard wired premises from the fire hazards which are inherently present when electric currents of commercial voltages are employed in buildings. These hazards are of many varied kinds. One early rule specified the use of screens or globes on arc-lamps to prevent particles of hot carbon dropping upon dry goods on counters in department stores. Present day rules seek to confine sparking and arcing parts to prevent ignition of inflammable and explosive vapors. The various aspects of the fire hazard continue to receive careful consideration and more or less elaborate treatment in the Code text.

From its inception the Code also dealt with workmanship in the installation of wiring and apparatus and with the quality and performance of the materials employed. The object sought thereby was probably to reinforce other provisions more directly addressed to the fire hazard, but the effect has been to set up a certain minimum standard as to workmanship and quality which has now become so established within the electrical industry as to prevail even in phases of application where the fire hazard is not a consideration. Except for major undertakings, property owners, architects and the general public expect that conformity with the Code's requirements guarantees acceptable performance, appearance and endurance of electrical installations. This particular condition is probably responsible for much, if not all, of the controversial situations which arise from time to time in Code affairs.

The two and more or less related efforts of safeguarding from the fire hazard and of securing good workmanship and materials were the principal code-making objectives for the first half of its existence. During the last ten or fifteen years another objective has been recognized and has come to have increasing attention and perhaps more attention (during the past few months anyway) than its relative importance justifies. This third and new objective is that of providing safeguards against injury to life and limb from shock and other ways in which electricity may provoke casualties.

Regulation to accomplish this objective was first demanded as the outcome of workman's compensation and employer's liability legislation. The first moves to satisfy these demands were met by the publication of the National Electrical Safety Code. Inspection authorities, principally state and municipal, applied the requirements of the Safety Code supplementary to the enforcement already established of the provisions of the "Fire Code." This, it was soon shown, was a clumsy and otherwise unsatisfactory procedure. It was obviously desirable anyway and in some ways essential that there be but a single code administered by a single authority, covering the details of a wiring installation. And so it has come about that, for wiring inside building, the Fire Code has been expanded more and more with the successive revisions so as to include recognized and established measures for prevention of electrical accident to consumers and users.

FOLLOWING my appointment as Chairman of the Electrical Committee, several major policies of the Code revision activity have been determined upon by the Committee and are in process of accomplishment, as follows:

a. The Committee has set up a detailed and orderly program for its procedure. It has only recently been reviewed by the Codes and Standards Committee of N.E.L.A. and has been approved as competently serving the interests of all concerned.

b. The Electrical Committee organization has been expanded so as to qualify as a Sectional Committee under the procedure of the American Standards Association.

c. As far as practicable the Code is to be confined to wiring and apparatus within consumer premises. Requirements for utility premises are to be stricken out.

d. The provisions of the Code are to be complete with respect to both fire and life hazards in the wiring of consumer premises so that all regulations applying thereto are to be found within the covers of a single publication; and finally,

e. Specifications for materials and like regulations which may not be applied by the inspector of wiring and at the consumer premises are to be taken out of the Code except as they are necessary to define what is acceptable to accomplish the intent of the wiring regulations.

I am sure that these major policies meet with your indorsement. They have not been fully carried out in the present edition, and it will be unreasonable to expect that they can be carried out in the next two or three revisions, but persistent attention to their principles will certainly insure much clarification in the Code's scope and detailed requirements in due course.

It is appropriate to discuss certain new ideas that are having application in the Code requirements. You are very properly concerned with the cost of wiring. This morning's talks show that your concern is deep and heartfelt. The Electrical Committee is under much pressure to adopt rules for the Code that will increase the initial cost of wiring a home. For example, Article 16 of the 1928 Edition specifies various branch circuits to be provided so that the expected use of current-consuming devices will not overload the branch circuits, will not result in blown fuses and will not add to the now too generous use of flexible cords. It is claimed and perhaps with reason that an initial investment providing these facilities will make more easy the early sale and use of current-consuming equipment in residence premises. If the public is to be taught to use this equipment, it is presumably reasonable to provide circuit equipment for it. And it is certainly an obligation on the Committee to prevent overloading, overfusing and a dangerous use of flexible cords.

The provisions of the 1928 Edition for use of the demand factor in determining upon copper sizes in risers and feeders certainly reduces the cost of wiring in the buildings and occupancies to which section 613 applies. Similarly the new provisions for motor-circuit wiring and fusing reduces the cost of wiring.

The situation which has brought about the organization of your Committee has seemed most disturbing to many who have felt that the status of the National Electrical Code has been impaired thereby. I have not shared these gloomy views, and now rejoice that out of the consideration given the Code by the executives of the utility industry there is the promise which this organization registers of constructive, technical and sympathetic cooperation in the future work of revising the National Electrical Code.

The activities of Underwriters' Laboratories in testing and classifying electrical devices and equipment, and in the preparation of standards applying thereto, are appropriately within the scope of your own concern. But time will not permit my describing them. Perhaps at some later meeting it will be my privilege to come before you and describe this work, so closely related to the National Electrical Code activity.

THE NEED FOR A MORE LIBERAL CODE

By E. W. Lloyd

Vice-president, Commonwealth Edison Company

WAYS and means to better the code is a very old subject. The report of a special committee made at a meeting in Philadelphia in 1914 aroused a great deal of interest. At that meeting I remarked that "There is only one point that I want to emphasize in connection with American practice and that is the present tendency of Underwriters to adopt such restrictions as will greatly handicap the development of small business. I do not want to be put on record as being in favor of unsafe wiring, but if their present methods are continued the Underwriters in this country will limit the expansion of this small business. I think it is possible for the manufacturers of wire and supplies in this country to get together with this body and the Underwriters and work out some system of wiring that will be acceptable to all, but on a much less costly basis than the present one."

The Underwriters, represented by Mr. Latta, took some exceptions to the remarks I made regarding restricting the code. Nothing transpired for a long time except that Mr. Blood has kept in touch with the situation before and since that time. I can easily understand the things that have caused the change that has taken place—the desire of the engineers to do a better job, the manufacturer desiring to produce a better product, and much more, all of which lead up to conditions that exceed the appropriate subject matter for a code.

I wonder if we realize the importance of our subject. It has been said by many important people that America's prosperity is based upon its production per man, but when we get right down to it I think we will have to say that it is also based upon the free use of electric power. Since the war, social and economic conditions have so changed as to alter our whole lives, and one of these important changes is that of labor in the home. Many women are doing all of their housework themselves. They find it difficult to employ help. Electricity in the home can do more to emancipate the women of our nation than anything I know, but we want them to have this electricity in a better way than now. Our industry has a vital responsibility to see to it that the kilowatt-hour is delivered to the home at the lowest possible cost. That cost is brought down by several things, among which is the freer use of electricity by those who now employ it; this will ultimately result in lower costs to everyone.

I believe that with the help of the men who are here today we will be able to devise a plan that will satisfy all concerned. The central station company needs the small business and the public wants the service. Those who look in an offhand way at the central station business say that we need no help, but the costs of power stations have materially increased in the case of a few of the larger stations, and if costs continue to go up, the situation will be still worse. Therefore, we need to look forward to the very near future when we will be selling more kilowatt-hours and thereby improving our load factor. At present the load factors of our systems rarely exceed 50 per cent, and this is too low. We are not selling enough kilowatt-hours.

THE average residential bill in America is $2.35 per month, and the average price per kilowatt-hour is under 7 cents. We have demonstrated in our own territory time and again that every time we cut the rate the use of electricity increases. We feel that $2.35 a month is such a small item in the family budget that surely the American people can afford to spend a good deal more. In each case, if that increase were 25 cents a month the total would amount to a very large figure, running into millions of dollars. There appears to be no doubt that the public wants and can advantageously use more kilowatt-hours, but that they cannot use them unless they install more wiring outlets.

You can make an analysis of any large industrial center in the United States and you will find that the use of electrical appliances is so small relatively that it is a reflection on the sales ability of our industry. We have a job on our hands to try to develop wiring, and systems of wiring, for the home that are both adequate and safe but which may still be installed at lower costs than those of today in order to make possible the use of electrical appliances with the greatest ease.

Surveys have revealed a very much underwired condition in the average American home. Some of our people in the electrical industry say that the cost of wiring has nothing to do with this situation, that it is merely a matter of selling. I cannot agree with this, for I have never found in all my business experience that high price offered no resistance. In a survey of 50,000 homes here in Chicago, we found that excluding lamps and fixtures and baseboard outlets the average number of outlets was seventeen, and I presume that figure would hold for the whole city. We found also that the number of baseboard outlets in the same group averaged only one and a quarter. We have made investigations into this situation, and we have found people running drop cords from ceiling outlets across the wall and down to some temporary outlet, and in other cases we have found cords running under rugs in many of the best apartments and homes in Chicago—thousands and thousands of them. Here in Chicago we were able to point out to other representatives of the industry that our existing local ordinance acted as a detriment and a drawback to the industry itself, since there was no means of serving a vast potential market that could be served if less expensive forms of wiring were available. Our ordinance was modified in an erperimental way to permit the extension of existing wiring systems in old residences by means of non-metallic sheathed cable. The results of this liberalization of the ordinance have more than justified the expectations of all concerned, and a handsome business has been done ever since the modification of the ordinance applying to the rewiring of old houses.

It appears to me that the subject of local electrical ordinances is one that should command executive attention in every central station company, and it is incomprehensible to me that any company or any local manager or superintendent should conceive that the local ordinance was not a matter of vital interest to the company and its officials. In various parts of the country local inspection rules are set up, often very drastic rules that differ in many respects from those of the National Code. I do not understand why people in the electrical business cannot agree to a universal, uniform standard of national rules so that we will not have these situations cropping up in all parts of the country. There is no subject that I have run across in my life that is so full of fearfulness and so overloaded with prophecies of the dire results that will follow upon the change in practices that may have been good twenty-five years ago. One would think, to hear some of the commentaries on proposed code changes, that in advocating the use of less expensive methods of wiring the advocates of such systems were indifferent whether they killed people at random or burned them up. We all must adopt a more optimistic and rational point of view, and above all we must "de-bunk" this wiring proposition, and I must record my opinion that it has an oversupply of this undesirable commodity. This situation is so charged with allegations of fearfulness that we do not get anywhere, and if this body of men feels as I do about it they can do a great deal toward de-bunking this code and all codes, so far as they refer to house wiring, and especially as to wiring in the American home. It took many years to get anywhere with non-metallic sheathed cable. Yet it is a perfectly good material that has amply proven its worth in practice, although many communities still will not permit its use. They have had concentric wiring systems for twenty-five years in Europe where they cannot by any possibility afford our costs, and this system has an admirable record for safety and service. In America the knob and tube system has an admirable record for safety and utility.

As I said before, this code situation has developed over a period of years to a point where the central station industry believes that the house wiring systems and the mass of regulations surrounding them have exceeded the bounds of reason and experience, and it is essential to our progress that we lend our efforts toward the adoption of regulations for house wiring that will permit our business to develop. The central station industry does not want anything that will interfere with the interests of other elements in the electrical industry, nor with those of the insurance companies. We have no desire to do harm to anyone, and we expect to act fairly toward all in the development of new systems and the scrapping of the old, but it is essential that there should be complete cooperation, because this is a very vital matter to all of us in the immediate future. Some of the present conditions must be changed, but in a way that will not interfere with the progress of any of the interests concerned.

This Half Century

(*Continued from page* 418)

should make sure that its own ethics and standards shall be above reproach. Its record of business enterprise and resourcefulness has invested it with peculiar distinction. It must maintain itself in public confidence by standards and practices that challenge the closest scrutiny. Possessed of the business enterprise which it has shown, and conducting itself so as to enlist the public confidence which it should possess, there stretches before it a limitless future, measured both in business opportunity and the satisfaction of social service.

When Thomas Edison forty-nine years ago established his Pearl Street lighting station in New York City, with 750 h.p. and fifty-nine customers, could he have possibly visualized the 2,100,000 h.p. generated in New York today? When as meter reader and bill collector he answered a complaint of overcharge at 23 Wall Street and convinced the Senior J. P. Morgan of the correctness of his lighting bill, could he have visualized the start of an industry that would dominate all industries?

A Challenge and an Inspiration

But at any scale of industry development, large or small, the qualities of intellectual stature, or earnestness of purpose, of simple sincerity, are the qualities which make his name inseparably connected with this new giant. They are the qualities which this industry may well pray will always mark its leadership. We properly celebrate tonight the Golden Jubilee of an epoch-making invention, and properly invest it with the character of a testimonial to private character and ability of which all America is proud. The history of this individual, and the history of all industry which has developed on the basis of his successive inventions, should give inspiration to American youth. I said earlier tonight, and I repeat, that the one deathless force in human life—a force from which human progress must inevitably continue to develop—is the power of the human intellect. I recall again a striking assertion of Mr. Kettering in which he states that "Whatever is within the range of the human mind to imagine, that thing can be done."

That note is a challenge and an inspiration, even as it is a characteristic of this industry and the individual whom we are honoring.

Reprints of addresses made at N. E. L. A. Convention are listed on page 414

SURGES AND FLASH OVERS

National Section Chairmen Are Appointed for the New Administrative Year

PRESIDENT SLOAN has announced the appointment of the four National Section Chairmen for the administrative year 1929-1930. They are: for Accounting National Section, W. R. Emerson, Oklahoma Gas and Electric Company, who succeeds J. F. Ford, of the Philadelphia Electric Company; for Commercial National Section, Marshall E. Sampsell, Illinois Public Service Company, reappointed; for Engineering National Section, Alex D. Bailey, Commonwealth Edison Company, who succeeds E. C. Stone, Duquesne Light Company; for Public Relations National Section, Harry Reid, National Electric Power Company, who succeeds J. F. Owens, Oklahoma Gas and Electric Company.

The new section Chairmen, who assumed their duties the first of July, have already appointed a number of the Committee Chairmen for their respective sections and all appointments are expected to be made before the end of the month. An organization meeting of the Public Relations National Section will be held at Chicago on July 17th and the Accounting National Section will hold an organization meeting on the same date at N. E. L. A. Headquarters in New York. Organization meetings of the Commercial and Engineering National Sections will also probably be held in July.

Mr. Emerson

Mr. Emerson, the new chairman of the Accounting National Section, is a native of Tennessee, and was born in 1886. Since 1905 he has been associated with public utilities in Oklahoma. He entered the service of the Muskogee Gas and Electric Company as a day laborer in November, 1905. He later occupied the positions of time keeper, collector, clerk, cashier, general bookkeeper, and auditor, to the spring of 1917, when he was promoted to the position of assistant manager of the Muskogee Gas and Electric Company. He served in this capacity until November, 1917, when he was transferred to Oklahoma City and made secretary, treasurer, and general auditor of the Oklahoma Gas and Electric Company.

In this capacity he has taken an active part in the development of the utility accounting system of the Byllesby Engineering and Management Corporation in Chicago, this company being the management corporation for the Oklahoma Gas and Electric Company.

From December, 1917, to April, 1918, he served in Washington as a dollar a year man in the reorganization and decentralization of the American Red Cross.

He has taken an active part in the work of the Accounting Section of the National Electric Light Association since the Geographic Divisions were first started, serving on various committees, and in 1925-1926, served as chairman of the Accounting Section of the Southwestern Geographic Division, later being made a vice-chairman of the National Accounting Section, in which capacity he served from 1926-1929.

Mr. Sampsell

A native of Marshall, Texas, Mr. Sampsell, reappointed chairman of the Commercial National Section, was graduated from the University of Chicago in 1896, and from the Chicago College of Law in 1899. He was clerk of the United States Circuit Court for the Northern District of Illinois from 1902 to 1907. He began his public utility career in 1903 as receiver for the Chicago Union Traction Company and other affiliated street railway companies. During the several years of this receivership, Mr. Sampsell took an active part in the street railway negotiations of that period, which resulted in the adoption of the famous Chicago traction settlement ordinance of 1907. Mr. Sampsell is a director of the Middle West Utilities Company and president of the Central Illinois Public Service Company, and Wisconsin Power and Light Company, two of its largest subsidiary companies. He has served as president of the Illinois Electric Railway Association and of the Great Lakes Geographic Division of the National Electric Light Association, and has been vice-chairman of the Public Relations Section, and during the past year, chairman of the Commercial National Section. He is also vice-president of the National Electric Light Association.

Mr. Bailey

Mr. Bailey, new chairman of the Engineering National Section, was born in Wisconsin in 1882, and has lived in Chicago since the age of seven. After graduating from Lewis Institute (Chicago) he worked for a short time for the Evanston Heating Company, and entered the employ of the Chicago Edison Company (a predecessor of the Commonwealth Edison Company) late in 1903, as mechanical engineer at the Harrison Street station. His evenings for five years were spent as instructor at Lewis Institute.

After three years at Harrison Street station, he was transferred to the Engineering Department of the company, where he spent the next two years planning general engineering work. In 1906 he was sent to Fisk Street station as Assistant Chief Engineer, and, later, became Chief Engineer of this station. On January 1, 1921, he was appointed Superintendent of Generating Stations of the Commonwealth Edison Company, which position he now holds.

Mr. Bailey is the author of numerous articles on the electric utility industry. Among the committees on which he has served are: Of the Commonwealth Edison Company, chairman, Generating Station; Accident Prevention; Trial Board; Advisory; Engineering; Labor Efficiency; 60-Cycle System Power Factor; Central Safety; Construction. Of the N. E. L. A., vice-chairman of the Engineering National Section; Counsellor of the Prime Movers Committee. Of the American Association of Mechanical Engineers, Main Research Committee.

Mr. Reid

Mr. Reid, new chairman of the Public Relations National Section, was a prominent figure in public utility circles in Kentucky and the Middle West for twenty years, although a native of New York. He first entered the electric light and power industry as an employee of the Fulton County Gas and Electric Co., Gloversville, N. Y., and after serving that utility in various capacities, he, with several others, purchased the Versailles (Ky.) Electric Light Company. Mr. Reid became interested in syndicating a number of public utility companies in central Kentucky, and later affiliated himself with the Kentucky Utilities Company, which was organized by the Insull interests, in the capacity of vice-president and general manager, in 1913, he was elected president of this company. In 1917 he was elected to the presidency of the Interstate Public Service Company. In 1927 he became president of the National Electric Power Company with offices in New York.

Mr. Reid has devoted considerable attention to association work, having taken an active part in the affairs of the National Electric Light Association, the American Institute of Electrical Engineers, the American Electric Railway Association, and the National Institute of Social Sciences.

Progress of National Food Preservation Program

By C. E. GREENWOOD

Vice-Chairman, Executive Committee, National Food Preservation Council

THE objective of the National Food Preservation Council in the promotion of National Food Preservation Month in September of this year is to impart knowledge and to impress the homemaker with the need of proper food protection in the home, and its relation to the public and family health.

September was chosen because of the vital need of promulgating the Food Preservation message at a time when so many homemakers feel that the "hottest" days are over and the use of ice or other refrigeration is not essential. It is a scientific fact that bacteria grows rapidly on food which is kept in a temperature above fifty degrees Fahrenheit. The insignia of the Council is therefore a thermometer indicating 50 deg. as the safety point.

IN no part of the country is there any considerable period when outside temperatures are within refrigerating range, that is between 32 deg., which is the freezing point, and 50 deg., which is the point at which bacteria begins to multiply.

Reports of the United States Weather Bureau show on the average only nineteen days throughout the year when the temperature in the United States throughout twenty-four hours is never below 32 deg. nor above 50 deg.

Even Commander Byrd, who is at present shut up for a four months' Winter period, finds it necessary to have artificial refrigeration to maintain a proper temperature for food storage.

Few people are acquainted with food temperatures, nor are they deeply concerned with the need of food protection. Only 15 per cent of the homes of the country ice their refrigerators all year round, which means that only those homes, and the homes using mechanical refrigeration, can possibly have an average of 50 deg. or under for proper food preservation.

Note the statement—an "average" of 50 deg. The "50 deg. danger point" used in earlier publicity material of the Council has been a controversial subject with some of the local ice interests. The intent of the Executive Committee of the Council is to join forces with the ice industry in promulgating an important and helpful message to the public. Changes in our earlier publications have been willingly made that we might advance with united front in our crusade. The National Food Preservation Program is a notable activity because it is educational in appeal and broadly cooperative in its execution.

Dr. Royal S. Copeland, an outstanding health authority, states "Health is life's greatest asset. To preserve health is to perpetuate happiness and success. So much depends on the food we eat that the proper care of the food in the home is a paramount public, as well as private, responsibility. The National Food Preservation Program—a movement looking toward wider knowledge of the scientific principles of food handling—is deserving of cordial commendation."

Dr. Louise Stanley, Chief of the Bureau of Home Economics, United States Department of Agriculture, states the Bureau of Home Economics will be very glad to cooperate with the various refrigeration interests in preparation of material for the Food Preservation Program and to indorse its activities, and that she will be glad to serve in any way that time will permit as a member of the National Food Preservation Council.

The Program has received the indorsement of such widely and favorably known associations as:

National Dairy Council
General Federation of Women's Clubs
National Refrigerator Manufacturers' Association
American Institute of Refrigeration
American Bottlers of Carbonated Beverages
National Retail Furniture Association
Refrigeration Division, National Electrical Manufacturers' Association
American Gas Association
Society for Electrical Development
Association of Edison Illuminating Companies

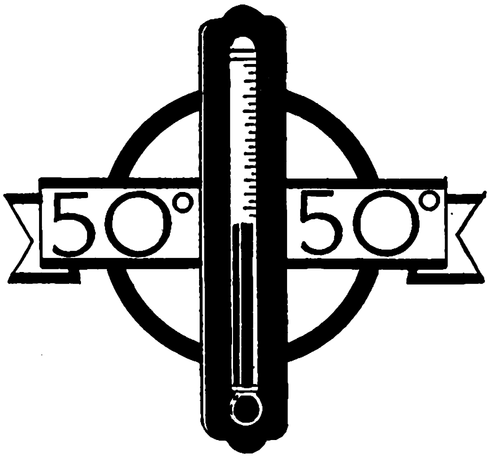
in addition to our own Association.

State and city organizations are rapidly being perfected by the Regional Directors of the Council. Many local units are in action. Newspapers are supporting the Program in full appreciation of public interest involved and several have already signified their intention to issue Food Preservation Supplements during September.

THE $25,000 National Contest has been announced and four page spreads have been placed in the September issue of such advertising mediums as *The Saturday Evening Post, Good Housekeeping, Literary Digest, Woman's Home Companion, Liberty, Ladies' Home Journal* and others. Millions of readers will be attracted by the Contest and will give special attention to food preservation. National judges will be men of prominence—Merle Thorp, Editor of *Nation's Business;* B. C. Forbes, Editor of *Forbes Magazine,* and Dr. Walter Hollis Eddy, Professor of Physiological Chemistry, Columbia University. We expect at least a million contestants to submit essays.

Upon the invitation of Mr. Matthew S. Sloan, President of the Council, Dr. Royal S. Copeland, United States Senator from New York, and Dr. Louise Stanley have been added to membership on the Council.

Contributions from the manufacturers who are supporting the national movement are still being received. The national fund will be matched multi-fold by local advertising and promotional activity of the power companies and other cooperating groups. So many executives of our industry have written hearty indorsement of this activity of the Commercial National Section that the Executive Committee of the Council, under the leadership of Mr. Marshall E. Sampsell, are highly confident of an outcome which will be of public benefit and one which will be to the ultimate advantage of all commercial interests in the refrigeration field and helpful to associations that are striving to promote better public health.



Insignia of National Food Preservation Council

Light's Golden Jubilee

ALL OVER the United States keenest interest in Light's Golden Jubilee is being manifested. Newspapers and magazines generally are showing enthusiastic approval of this universal celebration in honor of Mr. Edison and the fiftieth anniversary of the invention of the practical incandescent lamp; government officials, foreign countries, municipalities, universities, civic clubs, and many other organizations are cooperating in the most wholehearted manner.

Two publications have just been issued covering the story and plans on Light's Golden Jubilee.

The official Jubilee Book issued by Light's Golden Jubilee Committee, 420 Lexington Avenue, New York, tells the story of the Jubilee, the nature of this tribute to Edison, its inception, and how it is to be carried out. It is the official story of the Jubilee, released by the general committee of which President Hoover is honorary chairman. This sixteen-page book, in two colors, carries, in addition to the story of the Jubilee, information and data on the accomplishments of Thomas Edison in the various fields in which he has worked. All those interested in the Jubilee will want copies of this official Jubilee book in order that they may get the complete story of the celebration. Where communities are planning to take part in this world-wide tribute, copies of this book will prove ideal for distribution to all interested parties.

THE other book, published by the National Electric Light Association, entitled "Suggestions for Local Participation in the World Wide Tribute to Thomas A. Edison," contains forty-four pages, with a striking four-color insert. It is a publication local committees should use in deciding upon their method of organization and the ideas and plans they will use for local celebration. It also carries several pages listing material available for use in connection with local celebrations.

The book itself is divided into three parts. The first part states briefly the high-spots of the Jubilee, what it stands for, and why it should be carried out.

The second part gives suggestions in picture and text form, as to organization, who should be interested, what towns of various sizes can do, and then a wealth of ideas in connection with methods of celebrating the tribute. Among these are included pageants, parades, fairs, carnivals, fireworks, radio, libraries, schools, colleges, music, airports, street lighting, festooning, floodlighting, steam beacons, fountains, window displays, theatres, etc., etc.

The third part, under the head of Material Available, includes a list showing the picture, description, prices, and name of manufacturer and material. Among this material is a replica of first lamp, reprint of a New York *Herald* issued in 1879 describing Mr. Edison's lamp, electrotypes, official Edison picture, portfolios on arches, pageants and parades, book matches, stickers, outdoor posters, lighted wreaths, lighted plaques, lighted frames, transparent signs, pennants, display banners, metal medallions, lighting appliques, etc., etc.

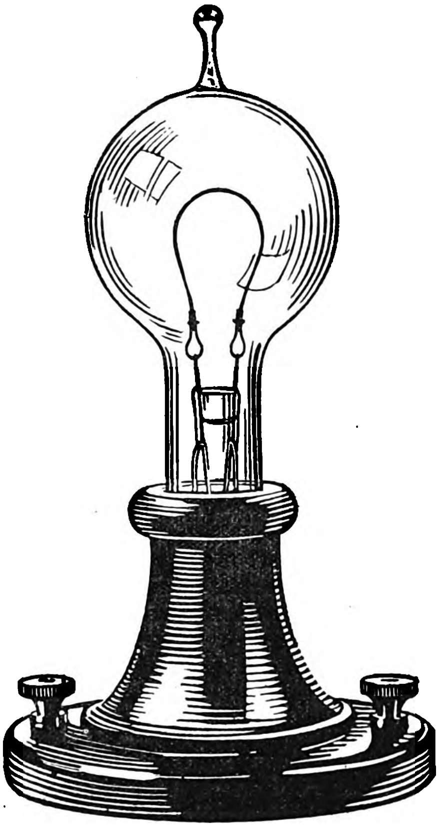
TO EDISON

When great God spake, "Let there be light! —
Did He forever banish night?

Did He make man insensate clod,
Or breathe in him the breath of God?

Man's night has proven man to be
The offspring of Divinity.

God willed that man should rule the night;
Man speaks, and God anew gives light.
—Nicholas Bryant Cook.



Replica of
Thomas Alva Edison's
FIRST INCANDESCENT LAMP

The following prominent men and women have accepted membership on the General Committee in charge of Light's Golden Jubilee:

Miss Jane Addams
James R. Angell
Gen. William Wallace Atterbury
Gen. Robert Lee Bullard
Dr. Nicholas Murray Butler
The Rev. S. Parkes Cadman
Newcomb Carlton
Walter P. Chrysler
Paul D. Cravath
P. E. Crowley
John W. Davis
Gen. Charles G. Dawes
George Eastman
Harvey S. Firestone
Hon. John S. Fisher
Dr. Simon Flexner
Henry Ford
The Rev. Harry Emerson Fosdick
James W. Gerard
W. S. Gifford
Miss Virginia Gildersleeve
Hon. Fred W. Green
William Green
Will H. Hayes
Dr. John Grier Hibben
A. B. Houghton
Roy W. Howard

Paul M. Warburg
Daniel Willard
Dr. Stephen S. Wise
Owen D. Young

Herbert Hoover, *Honorary Chairman*

A recent communication from J. F. Quinlan, executive secretary of Light's Golden Jubilee, states that among the 22 embassies which have already indicated their cooperation in the celebration, are the Italian Legation, the Roumanian Legation, the Royal Danish Legation, the Royal Norwegian Legation and the Canadian Legation; among the 13 states whose governors will cooperate, are, Massachusetts, Ohio, Kentucky, California and Texas; among the 19 cities whose mayors will cooperate, are San Francisco, California; Atlanta, Ga.; Detroit, Mich.; St. Louis, Mo.; and Atlantic City, N. J.; and among the 80 universities who will cooperate are Cornell University, Princeton University, College of the City of New York, Dartmouth College, Smith College, University of Alabama, Wellesley College, and Mount Holyoke College.

One hundred and eighty million of the special Jubilee stamp issue have been struck off by the Government engraving plant. The stamps are now on sale at all the larger post offices, and they can be secured by any postmaster upon request to Washington. It is the hope of Light's Golden Jubilee Committee that all light and power companies will use the stamps wherever possible between now and October 21, the date of the culmination of the celebration.

The Edison Song. composed by George M. Cohan, and first sung last month at the Fifty-second Convention of the National Electric Light Association, is expected to have a wide distribution.

Mr. Cohan has not only dedicated this song to the Jubilee, but has specifically stated that it is a complimentary song, for which he expects no recompense. He stipulated that the song should not be sold through regular channels for profit. He is, however, agreeable to the sale of the song with the profits and royalties turned over to some worthy cause, as the partial financing of an Edison monument at Menlo Park. Plans as to how this is to be done are being worked out at the present time.

Arrangements have been completed with Thomas A. Edison, Inc., Phonograph Division, to release this song in record form, played by B. A. Rolfe. Arrangements are also being made to have both Victor and Brunswick reproduce the song in record form. These records will be sold through the regular channels, but the profits and royalties are to be turned over to a fund such as mentioned previously.

Golden Jubilee Celebration at Niagara Falls

PRONOUNCED a complete success, the four-day celebration of Light's Golden Jubilee and the Fifth International Festival of Lights at Niagara Falls, came to a close on Sunday, June 16, having attracted more than 150,000 visitors.

Beginning with the arrival of Queen Electra on Thursday afternoon and continuing throughout the four days, the program was packed with spectacular events. The Queen and her court arrived by airplane and dedicated the new municipal air field in the afternoon. In the evening the coronation of the Queen was staged on City Hall steps before a battery of movie cameras and a crowd estimated at 5000 people. She then took her place in the throne car and led the four-mile pageant parade with its 60 illuminated floats and many marching bodies through the streets of the city. The entire route of the parade was decorated with American and Canadian flags, gold and white bunting and golden banners announcing Light's Golden Jubilee, while the street lights were converted from white to gold by the use of mica color caps inside the globes. The floats in the parade were magnificent and were recorded by every film service, both silent and sound, in the United States.

Friday was devoted to a celebration of Flag Day, together with a pageant in the afternoon by the Boy and Girl Scouts on Green Island in the American channel above the falls. In the evening Queen Electra and her court held forth at an open-air ball in the streets. The limits of the dancing space were marked with strings of multicolored lights in which the golden lights predominated.

Three parades were staged Saturday morning, afternoon and early in the evening by members of the Loyal Order of Moose, who were meeting in convention during the celebration. Shortly before 9 o'clock a train a 50 years ago, labeled the New York Central Jubilee Special, arrived with a party of 100 tourists in the costumes of 1879. These proceeded to Falls Street, and in hacks and horse cars went to Prospect Park, where they witnessed a reproduction of the original lighting of Niagara Falls in 1879. Open type arc lamps threw the lights through colored glass slides on a small fountain in the park, and operating the lights and fountain were the same men who handled the original installation. Then, with breath-taking suddenness, the full force of the 1,440,000,000 candlepower searchlight battery were swung against the falls in golden lights as a tribute to Thomas A. Edison. Swinging up into the sky, the searchlights performed the ghost dance and sky drills, and then, as they dropped back on the falls, an airplane circled over Goat Island, and from the dark released a barrage of aerial bombs in a sham air raid on the island. Rockets and bombs were shot up from the cliff in imitation of an anti-craft battery, while the searchlights pinned the airplane against the clouds. This spectacle, which attracted such a crowd that it took five hours for traffic to clear, was described, during the General Electric hour on a coast-to-coast hook-up of radio stations, by Graham NcNamee standing with one foot in Canada and one foot in the United States on the Falls View Bridge. Philips Carlin, at the base of the falls, put Niagara's voice on the air, while Paul Dumount and the regimental band of the Toronto Regiment furnished the musical interludes for the radio program.

Local Knights of Columbus sponsored a Pontifical High Mass on Goat Island Sunday, commemorating the 250th anniversary of the discovery of Niagara Falls by Father Louis Hennepin. This event was broadcast by station WKBW of Buffalo, and silent and sound pictures were made by every film service present. This colorful ceremony attracted another large crowd, and Goat Island was a sea of faces during the mass.

Through radio, movies, newspapers and actual attendance it is estimated that more than 4,000,000 people heard, read or saw the Golden Jubilee and International Festival of lights celebration at Niagara Falls.

Californian Wins "Light's Golden Jubilee Essay Contest"

WILLIAM M. FISHER, of the Los Angeles Gas and Electric Corporation, has been named as first prize winner in the nation-wide "Light's Golden Jubilee Essay Contest." Along with first place, he wins a cash prize of $150.

William F. Galloway of the Middle West Utilities Company, Chicago office, won second place in the competition, and $75.

Honorable mention fell to Travis L. Bogue of the Public Service Company of Oklahoma, at Tulsa.

This contest, which ran from May 1 to 15, was open to all employees of member companies of the N. E. L. A., except to officers, managers, department heads and those who specialize in the sale of light. One hundred and sixty-two essays were submitted to the office of W. S. Vivian, contest conductor, in the two weeks of its duration.

The judges were: Earl Whitehorn, editor of the *Electrical World;* D. L. Gaskill, secretary of the East Central Division of the N. E. L. A.; and Miss Sophia Malicki, of the Midwest Utilities Company.

Service Suggestions
NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.
To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 73 **July, 1929**

Mechanics of Correspondence

By FRANK R. MITCHEL

Georgia Power Company, Atlanta, Georgia

THE CUSTOMER Relations Committee in this article stresses the necessity and importance of a survey and check-up on the handling of company mail. Reference is also made to a follow-up system which will insure prompt replies, and to a filing system.

An exhaustive study of systems followed by various companies has been made to obtain ideas for the guidance of others. At first thought the subject may be considered so simple that it does not deserve much thought or consideration. However, it is the things of apparently little consequence that often bring embarrassment and ill-will to the operating company. The little slights often cut more deeply and remain unhealed for a longer period than a grievance of much greater proportion, since the larger and more serious complaints are practically always brought to our attention while the smaller often do not reach us. These fancied slights are often nursed and remembered by the customer, who awaits an opportunity to even up the score. Nothing so chagrins the average person as the failure to receive a reply to a letter he has taken the trouble to write and send.

No company would knowingly permit a letter to remain unanswered, but this often occurs on account of a loose system of handling mail or the carelessness of some employee.

There are few companies which do not occasionally receive a letter complaining that no reply was received to a letter of certain date. Requests made by letter frequently do not receive attention. All letters deserve and should receive a prompt and courteous reply. Therefore, it should be impressed upon every member of each organization that prompt attention must be given every communication received.

Most companies have a lock drawer at their local post office. With rare exceptions every letter will be placed in this box. From the time it is put there the responsibility rests with the company. No one but a careful and trusted employee should have possession of the post office box key. Preferably only one person should have this responsibility, and if this is not practical the responsibility should be restricted to as few employees as practicable.

The removing of the mail from your box and the delivery of it to the proper department in your company are steps that should be carefully supervised. Mail will occasionally be lost if a suitable container is not provided the messenger. This should be securely locked or closed.

HELP?

Light and power companies frequently have problems of policy or procedure on customer relations matters which are difficult of solution. It is the function of the Customer Relations Committee to aid companies in solving such problems. The committee will be pleased to receive requests for opinions of its members and will also endeavor to obtain the experience of operating companies for your guidance.

Address such requests direct to the chairman.

H. T. EAST, *Chairman,*
Customer Relations Committee,
1427 Edison Building,
Chicago, Illinois.

In preparing this article the writer purposely visited his local post office several times, investigating and forming an opinion as to how the mail of the various business houses was handled. It was astonishing indeed to see the general carelessness that prevailed. It was surprising to see the great number of messengers whose satchels were much too small for the bulk of mail collected from their respective boxes. Consequently, many employees left the building with satchels that could not be closed on account of being overfilled. You can draw your own conclusions as to whether all of this mail reached its destination. It was still more astonishing to see the number of young women and young men, as well as porters and messengers, that came for their mail without any receptacle whatsoever. Scores would leave with their arms full of mail of every description. It is practically impossible for this procedure to go on, day after day, and several times each day, without a considerable loss of mail. Naturally, there were messengers that handled their jobs in a most systematic, businesslike way. They had well-designed satchels, or mail bags, and were careful in collecting all of the mail from the drawer. Satisfying themselves that no mail was left, either in their drawer or upon the floor, their bags were locked and the keys returned to their pockets. This insured their offices receiving all mail intact. The importance of systematizing this detail of your business can be readily seen.

Where mail is delivered by carrier a well-designed receptacle of ample size should be provided and this located where the mail will be safe at all hours.

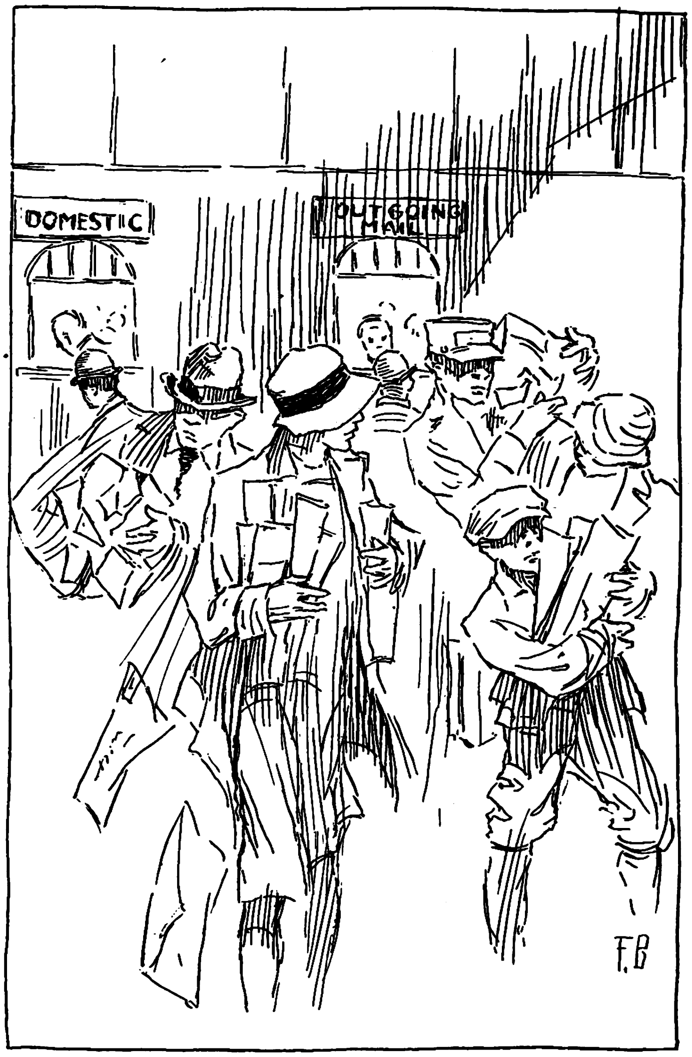
No doubt most utility companies have a fairly good mail handling system, but many of the larger utilities have made an extensive study of this particular phase of their business and have developed ideas which could profitably be used by others.

A mail department is a service department. It should be so organized as to fulfill this purpose thoroughly and efficiently, always keeping the interest of the company's patrons in mind. Most important of all is the selection of the proper employee to have charge of the mail room. This is doubly important in companies which have assigned to this employee the duty of directing the mail to the various departments and officials of the company. Considerable responsibility is attached to this duty, and a well-trained, well-informed person should be placed in charge of this work. On this employee several of our largest and foremost utilities place the responsibility of receiving, opening, sorting, reading and routing of all mail received addressed to the company. Naturally, all outgoing mail passes back through this same department.

A study of the systems used by the various companies forces the conclusion that conditions throughout our country are so varied that no one system, however well perfected, can be applied to all companies alike.

A few of the outstanding utilities of the United States have practically perfected their mail handling systems. It is doubtful whether smaller companies could economically adopt such systems in their entirety. One highly systematized company prefers the plan of requiring their mailing department to remove the contents of all the company's mail and classify it before assorting it for the various departments. For instance, all overdue bills are placed in one lot and sent to the cashier's office, bill and check being pinned to the envelop. Correspondence, with checks attached, is kept separate and sent to the cashier, where it is given priority over all other mail, in order that the correspondence attached may be returned to the mail room, where it is dispatched to the department interested. Still another separation is made of the checks sent to pay current bills. These are assorted into three lots as follows:

1. All bills which require receipts.
2. All checks with stubs which do not require receipts.
3. All money orders sent in payment of bills.



Drawings by Frank Barnes, Brooklyn Edison Co.

It was astonishing to see the general carelessness that prevailed

These three lots are delivered to the cashier's department. All bills sent in for purchases are stamped as to time received, as from this stamping the company regulates the time taken for discounts. Invoices for coal are sent to the fuel department, other invoices go to the purchasing department, and so on through the list.

Every effort should be made to discourage the sending of stamps and money through the mail. But when such mail is received the mail clerks should initial the envelope and turn it over immediately to the supervisor, whose duty it is to list such mail and send it direct to the cashier or his assistant.

A record of all registered mail should be kept in the mail room and a receipt obtained when it is delivered to the proper party. While individual receipts are more practical for use in large companies, it appears that the use of a register would be more convenient for the smaller ones. Either plan is satisfactory.

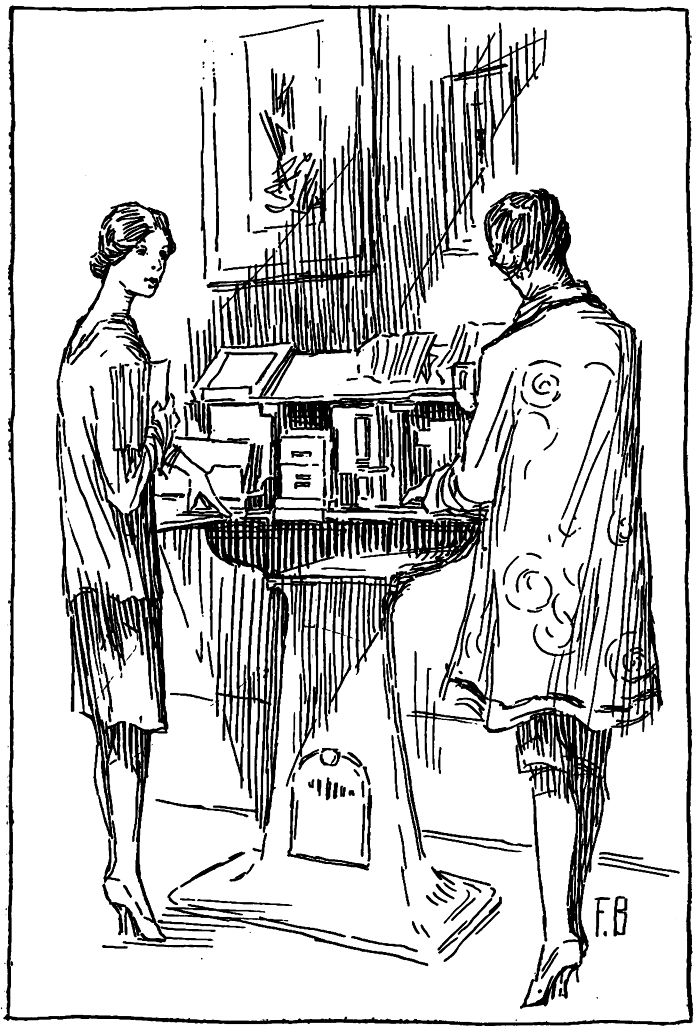
Each piece of mail received should bear a stamp showing the time it reached the company's office. Mail should, of course, be distributed without delay. The employee selected to assort incoming correspondence must possess a general knowledge of the personnel and the functions of each department. It is also advisable to designate an employee in each department who will receive its mail.

Officials of the smaller companies do not generally favor the practice of separating the mail to the extent followed by most of the large companies. They believe that all mail containing checks should be classified as cashier's mail, and sent direct to that office. It is their opinion that this class of mail should be handled by the tellers in that department. Upon the cashier would devolve the duty of sending correspondence accompanying remittances to the proper department. Great care must be taken to see that notations and memoranda made on the face or reverse side of the invoice are not overlooked. Many of our customers have the habit of making their wants known in a most original and sometimes crude manner. Frequently such notations as "Bill too high," "Please investigate bill," "Have not been home but a few days this month," "Do not want to buy your company," and other like expressions appear on a bill. Experience has proved that correspondence of this type is more serious than the average business letter of complaint. It has been demonstrated that the customer who has written a long letter of complaint has eliminated much of his ill-feeling, while the customer who has made a short, terse statement often has ill-will pent up in his system. If the same consideration is given to these terse complaints as is given to our general correspondence much unpleasantness can be averted. *They should be referred at once to the department responsible* for high bill complaints.

The trained eye of the teller is more apt to catch these notations than the employees of the mail department and they should therefore be definitely instructed concerning their disposal.

Too much stress cannot be placed upon the importance of a prompt reply to every letter. A 24-hour limit for reply has been established by many companies. However, there are many letters of such a nature that cannot be answered immediately. Coming under this head is what we term high bill complaints. A letter which cannot be answered promptly should be acknowledged at once, notifying the customer that his request shall receive immediate attention and that the result of the investigation will be sent at an early date.

Many companies do not consider that a personal call answers a letter. When a representative is sent to explain a matter a letter is written either to inform the customer of the call or to state that the call was made. This plan has merit. It is interesting to note here that in at least one state the public utilities commission requires all written complaints to be acknowledged in writing.



A machine which imprints an index, in lieu of stamps

A correspondence record is one means of avoiding failure to answer letters. Such a record shows name of sender, date and time of receipt, brief statement of subject, date of acknowledgment, to whom referred within company, and final disposal. By checking back periodically letters not answered can be quickly identified and the average elapsed answering time can quickly be determined.

This brings us to a discussion of the control of correspondence. The limited number of companies that have adopted the idea of correspondence control have found it very satisfactory. It will readily be seen that a system of this nature must be highly specialized. It requires that the correspondence department obtain speedy and accurate information from all of the departments of the entire organization in order that the numerous and varied correspondence can be satisfactorily and accurately handled. The head of such a department must necessarily be a man of considerable ability, with a general insight into the entire business.

All the details of the various systems in use today cannot be set forth in a paper of this nature. It will be worth the time of officials of companies who feel that their correspondence is not systematized to make a more extensive study of the systems used by some of the larger utilities. The officials of each company know their particular requirements and can best judge the system best suited to their needs. But the importance of standardizing our correspondence should be evident to all.

Inter-office mail must not be overlooked. Every company has a large amount of correspondence between the various departments, and it is important that this mail should be systematized. Prompt replies, together with accurate and speedy delivery are necessary in all departments of all utilities of the present day.

Any article on the subject of correspondence control should not overlook the outgoing mail. The system used by one of the larger utilities which maintains a mailing department, is presented as a typical set-up which covers outgoing mail handling.

All of the departments of this company are required to send all their outgoing letters to the mail room. Where there is no return card on the envelop it is put through a mailo-meter, where it is sealed, stamped and counted, under one operation, at the rate of 200 a minute. As the mail comes out of this machine it is properly faced, sorted, and bundled into local and out-of-town mail, and delivered in locked mail pouches to the post office.

A recent regulation of the United States Post Office Department permits the use of a machine which imprints an index in lieu of stamps. This imprint also serves as a cancellation mark. Permits can be obtained from local post offices for use of such machines. Eighty per cent of this company's mail is sent through machines of this type. By their use stamping, dating and timing are accomplished at one operation and mail service is speeded up. All departments are urged to send mail out when ready and not wait till near close of business. The mail goes to the post office hourly, 70 per cent being in the post office by 4 p. m.

The department that receives and distributes your mail, in connection with every other department of your organization, expands with its growth. With the ever-increasing responsibility that is being added to this department, too much attention cannot be given to its formation and management.

The Customer Relations Committee issues a service suggestion monthly. Each contains some workable plan for service improvement or idea which will aid in promotion of customer good will.

Subjects of recent issues were:

63—*Courtesy Letters.*
64—*Tree Trimming from Public Viewpoint.*
65—*The Telephone as a Service Medium.*
66—*Handling Requests for Discount Allowances.*
67—*Informing our Customers About our Business.*
68—*Training Employes in Customer Relations.*
69—*Records That Speed Service.*
70—*Employe and Consumer.*
71—*Correspondence for Good Will.*
72—*Teaching Customers to Read Their Meters.*

Reprints of the present issue or any of those listed above can be furnished in any quantity at 5c. each. Order direct from the chairman.

Basic Information on the Electric Light and Power Industry

As of April 30, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the BULLETIN.

1. Value of plant and equipment (estimated)	$10,200,000,000
2. Total generating capacity in Kw	27,972,000
Steam	20,040,000
Waterpower	7,636,000
Internal combustion	296,000
3. Total number of customers served	23,697,000
Farm customers	226,400*
Domestic customers	19,382,000
Commercial customers	4,282,000
4. Population in electrically lighted homes (Electrical World)	81,500,000
5. Percentage of homes which are served with electricity	66
6. Miles of transmission lines (11,000 volts and above) (1927) (circuit miles)	132,000

---

* As reported by some 197 companies only.

N. E. L. A. Index of Industry and Trade

CONTINUED high records in the activity of industry and trade are shown by the statistics of the output of the country's electric light and power plants as reported by the United States Geological Survey.

The production of electricity during May by all the agencies which contribute to the country's supply, as given by the Survey, was 8,093,373,000 kilowatt-hours, an incraese of 13½ per cent over the same month of last year.

According to these figures, the Electrical Index of Industry and Trade, prepared by the National Electric Light Association indicates that business in May was 12.8 per cent above the normal for that month, as measured by the trends of the past ten years. This is a gain of nearly one per cent over the figure for April, which, in turn, stood at the highest figure since the great industrial activity of the years 1919-1920.

As measured by the output of electricity, business was extraordinarily active in the entire region east of the Mississippi. On the Pacific Coast, industry and trade are also substantially above last year's levels. A slight recession in mining activity is, however, indicated by the fact that the Rocky Mountain region, as a whole, showed an increase in output of only four per cent above last year.

The index, month by month, for the current period and for the previous two years, stands as follows:

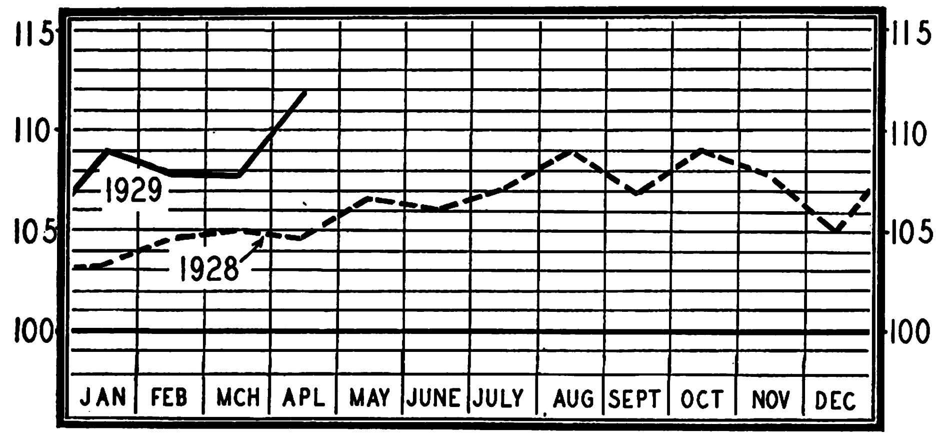
Electrical Index of Industry and Trade

	1927	1928	1929
January	104.9	103.2	109.0
February	103.8	104.7	107.9
March	106.9	105.0	107.8
April	106.8	104.6	111.9
May	106.3	106.6	112.8*
June	106.1	106.0	
July	104.8	107.1	
August	104.9	108.9	
September	104.8	106.8	
October	102.6	109.0	
November	102.9	107.8	
December	103.1	105.0	

* Subject to revision.

The N. E. L. A. Index of Industry and Trade is based upon the deviation of the total output of electricity by all agencies which contribute to the public supply plus imports from Canada, from a computed "normal" figure for each month, which "normal" is adjusted for the continued growth of the light and power industry and is further corrected for seasonal variation.

ELECTRICAL INDEX OF INDUSTRY AND TRADE



National Electric Light Association Statistical Research Department

Taxes Consume Ten Per Cent of Light and Power Company Revenue

TAXES paid by the electric light and power companies in 1928 were the highest on record and showed an increase of $7,000,000 over the figure for the previous year, according to the Statistical Research Department of the National Electric Light Association. The sum total of payments made to all tax-collecting agencies in the United States (local, county, State and Federal) for 1928 amounted to $165,000,000, as compared with $158,000,000 in 1927 and $137,000,000 in 1926. These figures are approximately 10 per cent of the revenues received by the electric light and power companies from the ultimate consumers of the energy they distribute. In other words, every time the average user of electricity pays a dollar for his service, he is really paying ten cents toward the conduct of government, while the electric light and power company is only getting ninety cents.

During the past fifteen years taxes have increased almost twice as rapidly as have revenues from consumers. In 1928 revenues were approximately seven times as large as they were in 1912, whereas taxes were nearly thirteen times as large. This rate of increase is more than three and a half times that of the steam railroads, whose taxes are now only three and a half times the total of 1912. A comparison of the taxes paid by the electric light and power companies and the Class I railways of the United States shows the increasing burden which is being carried by the user of electricity as compared (for instance) with the user of transportation.

Total Taxes Paid

Year	Electric Light and Power Companies	Class I Steam Railways
1912	$13,000,000	$110,000,000
1922	73,000,000	301,000,000
1926	137,000,000	389,000,000
1928	165,000,000	389,000,000

1912	Railroad taxes 8½ times electric
1922	Railroad taxes 4 times electric
1926	Railroad taxes 2¾ times electric
1928	Railroad taxes 2⅓ times electric

If present trends continue, the public utilities of the country will be paying as much in taxes as the steam railroads during the present year. An estimate of the tax accruals for 1929 shows the following approximate figures:

Taxes—1929

Electric light and power	$172,000,000
Electric railways	62,000,000
Manufactured gas	54,000,000
Telephones and telegraphs	100,000,000
Total (not including water works)	$388,000,000

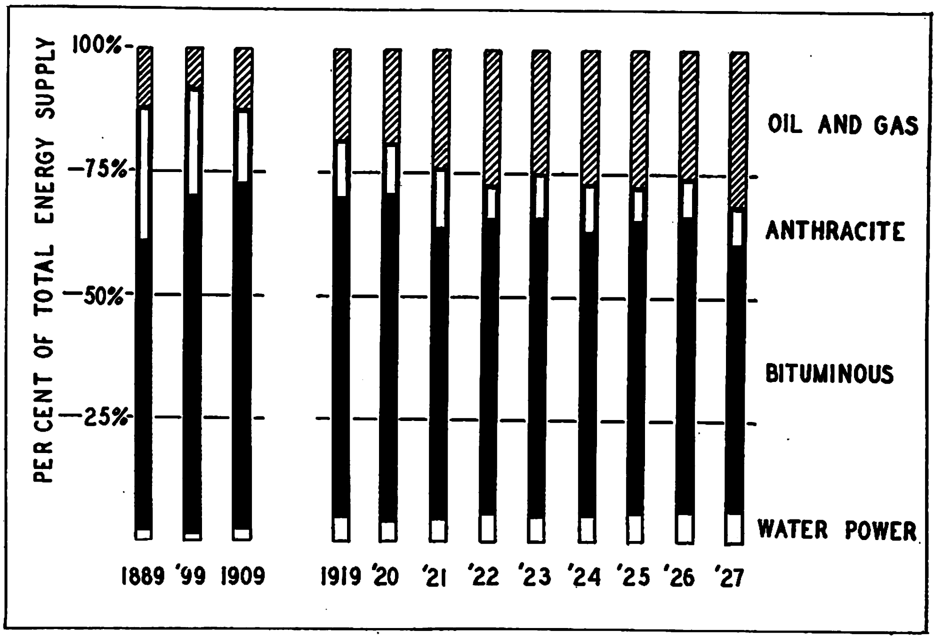
Energy Supply of the United States

According to a bulletin recently published by the Bureau of Mines, Department of Commerce, the total consumption of energy in the United States—that is, energy from all sources, including coal, oil, natural gas, water power, firewood, animals and windmills—is equivalent to 1,000,000,000 tons of coal per year. Of this amount, bituminous coal furnishes a little over one-half of the country's requirements.

To those who believe that water power will eventually provide most of the energy required by industry, transportation and other activities, it will be interesting to note that in 1927 it supplied but 6.3 per cent of this energy. Domestic and imported oil accounted for 21.4 per cent, natural gas for 5.8 per cent, coal (anthracite and bituminous combined) 58.4 per cent, firewood 5.5 per cent and animals 2.5 per cent.

In other words, oils supplied approximately 3¼ times as much, and coal 9 times as much energy as water power.

The accompanying chart shows the relative changes in the proportion of the major components of the grand total of the nation's supply of energy.



(U. S. Bureau of Mines)

Proportion, in the total supply, of energy derived from various sources

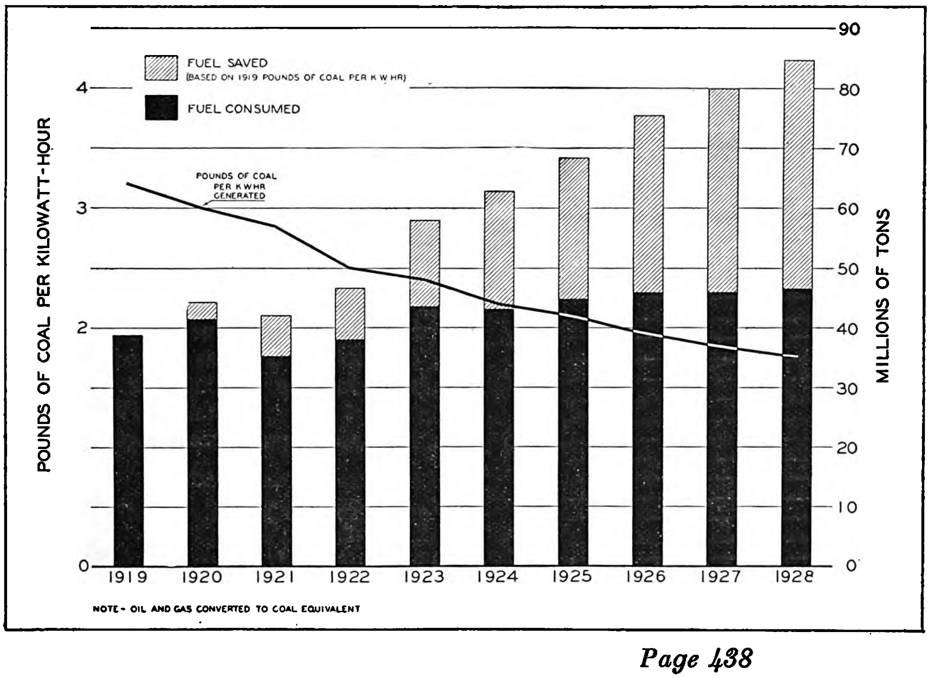
Conservation of Natural Resources Accomplished by Electrical Industry

The accompanying chart shows in a graphic manner the contribution to the conservation of natural resources which is being made by the constant improvement in facilities, larger units, interconnection and greater efficiencies in the electric light and power industry.

"During the last 25 years," states the U. S. Bureau of Mines in its recent publication, *Coal in* 1927, the total production of electric power by central stations and electric railways has increased nineteenfold. Part of the increase is due to the development of hydro power; but, nevertheless, the production of fuel power has risen from 4,000,000,000 kilowatt-hours in 1902 to about 53,000,000,000 in 1928, an increase of thirteenfold. The consumption of coal has increased during the same period, but in much smaller ratio. In 1902, the utilities used, in round numbers, 11,000,000 tons; in 1928 they used 41,300,000, an increase of less than fourfold against the thirteenfold increase in power production.

"This astonishing result has been made possible by improvements in fuel efficiency. In 1902 the average consumption per kilowatt-hour was about 6.6 pounds; by 1917 this had been cut to 3.3 pounds. Particularly rapid progress has been made since the war, and in 1927 the average fell to 1.84 pounds. Even this is much above the performance of the best plants today, and one station on the Ohio river below Cincinnati has touched a record of 0.86 pound per kilowatt-hour generated."

The constantly increasing efficiencies of steam generating plants located at or near available markets for power are making them serious competitors of hydro-electric enterprise, particularly when the location of the water power is such as to require heavy investments in long-distance transmission lines.



Statistical Data of the Electric Light and Power Industry for the Year 1928

PREPARED BY THE STATISTICAL RESEARCH DEPARTMENT OF THE ASSOCIATION WITH THE COOPERATION OF THE STATISTICS COMMITTEE OF THE ACCOUNTING NATIONAL SECTION, N. E. L. A.

THE statistics herein reported embrace the operations of enterprises devoted exclusively to the generation and distribution of electricity, plus the electric departments of all others which maintained electric light and power systems jointly with other public utility services. These "composite" companies constitute approximately three-quarters of the total number.

These data were determined from reports received at N. E. L. A. Headquarters from some 365 companies, whose operations represented approximately 85 per cent of the entire industry and, together with the published returns of municipal systems and of others filed with various Public Service Commissions, were prorated to cover 100 per cent of the total electric light and power business.

Comparison with Previous Statistics

In this statement detailed comparisons have been made with corresponding figures collected by the Association for the years 1927 and 1926 and with those collected by the U. S. Bureau of the Census for 1922.

An effort has been made to account for the entire operations of the electric light and power industry, including the light and power business done by electric railways. In past reports to the U. S. Bureau of Census composite companies operating both power and traction systems in many cases did not separate their light and power business from their traction business, and a certain percentage of the former was therefore included in the Electric Railway Census. For that reason, in comparing these data with census reports, the following percentages are necessary to place them on the same basis:

1926, 1927 and 1928: The figures herewith represent 100 per cent of the electric light and power industry.

1922: Census figures represent 93 per cent of the electric light and power industry.

1917: Census figures represent 92 per cent of the electric light and power industry.

1912: Census figures represent 90 per cent of the electric light and power industry.

The forthcoming 1927 Census of the electric light and power industry is expected to separate the operations of the various utility services and, as its schedules are in close similarity with the N. E. L. A. forms, will show figures which are comparable with those outlined in this statement.

Growth of the Industry During 1928

Table I shows the outstanding features of the growth of electric service in the United States during the past year.

The number of domestic consumers increased by 1,163,000 or by 6.5 per cent. This was somewhat smaller than the 1,337,000 increase shown during 1927 or the 1,383,000 shown during 1926. This, however, is in line with expectations, inasmuch as the aggregate of unwired houses is steadily diminishing in urban communities and the number of

TABLE I

Street lighting	1,525,000,000	1,349,000,000	176,000,000	13.0
Street and interurban railways	4,545,000,000	4,634,000,000	— 89,000,000	—1.9
Electrified steam railroads	562,000,000	481,000,000	81,000,000	16.8
Miscellaneous services	424,000,000	371,000,000	53,000,000	14.3
Total	68,105,000,000	61,591,000,000	6,514,000,000	10.6
Revenues Received from Ultimate Consumers				
Domestic	$555,944,000	$502,743,000	$53,201,000	10.6
Commercial (small light and power—retail)	523,180,000	484,528,000	58,652,000	8.0
Commercial (large light and power—wholesale)	591,195,000	553,834,000	37,361,000	6.8
Street lighting	74,566,000	68,340,000	6,226,000	9.1
Street and interurban railways	42,316,000	43,523,000	— 1,207,000	—2.8
Electrified steam railroads	5,617,000	4,933,000	684,000	13.8
Miscellaneous services	8,620,000	6,874,000	1,746,000	25.4
Total	$1,801,438,000	$1,664,775,000	$136,663,000	8.2

new customers depends more and more upon new building construction. This in turn is showing increasing signs that the deficiency in housing which originated during the war period is rapidly being overcome.

Electricity used in domestic service has shown the increase of more than a billion kw-hr., reflecting an enlarged use per customer, as well as the growth in their numbers. The total energy used in the country's homes and farms grew, during 1928, by nearly 15 per cent. This is a considerably larger proportionate growth than that shown by commercial service.

The generation of energy by electric light and power plants increased by 7,543,390,000 kw-hr., or by 10.1 per cent over 1927, and attained the record total of 81,868,420,000 kw-hr.

Generating Capacity, installed in these plants, increased by 1,890,000 kw., or by 7.4 per cent. Of this increase, 1,271,000 kw., or about 67 per cent, was in fuel-using equipment, and 619,000 kw., or about 33 per cent in hydraulic, of which 252,000 kw. was located in one large installation.

All generating plants taken together, the electric light and power industry operated at an average of 35.5 per cent of capacity, as against 34.5 per cent in 1927 and 33.8 per cent in 1926.

Revenue from all classes of consumers increased by $136,663,000, or by 8.2 per cent. This was substantially less than the $195,649,000 increase between the years 1926-1927, and reflects in no small degree the results of the industry's general policy of passing on to the public the benefits resulting from the economies of improved engineering and management.

TABLE III

COMMERCIAL STATISTICS—SALES OF ENERGY

Sales to Ultimate Consumers	No. of Customers	Kw-hr. Sold	Revenue
Farm service (included below, for details see Table VI)	(175,913)	(1,066,764,000)	($19,870,000)
Domestic service (all uses, including non-irrigated farm service)	19,077,013	8,489,332,000	555,944,300
Commercial service			
(a) Small light and power (retail)	3,583,522	11,504,346,000	523,179,900
(b) Large light and power (wholesale, including irrigated farm service)	546,073	41,055,721,000	591,194,800
Municipal street lighting	20,257	1,524,308,000	74,565,600
Railroads—motive power			
(a) Street and interurban railways	461	4,545,022,000	42,316,500
(b) Electrified steam railroads	20	562,160,000	5,617,000
Municipal and miscellaneous	8,105	423,666,000	8,620,200
Total to ultimate consumers	23,235,451	68,104,555,000	$1,801,438,300
Sales for Resale			
Municipal electric distribution systems	751	964,524,000	$12,547,200
Other electric companies			
(a) Sold at points within State lines	1,222	8,471,275,000	68,655,300
(b) Sold at State line for export over State lines	163	3,735,740,000	26,161,800
Total sales for resale	2,136	13,171,539,000	$107,364,300
Grand Total Sales (kw-hr. duplicated by energy sold for resale)	23,237,587	81,276,094,000	$1,908,802,600

Note: Number of customers added during year.

Farm Service Domestic Service	1,163,062
Commercial Service:	
(a) Small Lt. & Pr. (retail)	204,810
(b) Large Lt. & Pr. (wholesale)	30,201
All Others	3,350
Total added during year	1,401,423

Use of Electricity—Table II

While a substantial increase in revenue was registered in every classification, it will be noted from Table II that the rate of increase in revenues received from domestic service was much *less* than the rate of increase in kilowatt-hours sold. This is reflected in a notable drop in the average price paid by the domestic consumer. The summary of the industry's growth is outlined in Table I, and a comparison between sales and revenues in the several classes of service follows in Table II.

Sales of Electricity—Table III

These are presented in tabular form, comparable with figures published in previous statistical bulletins.

The "number of customers" constitutes the total number of locations which involve contractual obligations on the part of the electricity supply systems to render service. The actual interpretation of this term, as well as its distribution between the various classes of service, has been determined by the individual companies reporting.

Figures covering farm service, which are shown on both the N. E. L. A. and the U. S. Census forms, have been included in "domestic service" for service not involving irrigation and under "commercial service—large light and power (wholesale)" for service where irrigation pumping occurs.

Limitations of Certain Statistics

The interlinkage of the various utilities operated jointly within the same organization in the "composite" companies, together with the fact that much of the property is used in common, renders the exact distribution of many items a matter of considerable difficulty and, in the last analysis, often a question of individual judgment on the part of the reporting company.

In addition, the diversity of rate schedules has made it impossible for all companies to render returns exactly conformable to the particular classifications requested in the annual report form and thereby has necessitated some use of estimates for such companies. While calling attention to the desirability of statistical uniformity throughout the industry, it is felt, however, that the comparatively small number of these instances has not entailed any appreciable degree of error in the final results.

It is gratifying to note that an increasing number of companies evidence a willingness to make the separation of their service in accordance with the classifications of the N. E. L. A. and Census schedules.

Trends in Use and Price of Electricity During 1928—*Table IV*

Reduced to over-all averages, the use of service by the several classes of ultimate consumers in 1928, as compared with 1927, is shown in Table IV.

There has been an increase of 30 kw-hr. in the average amount used by the average domestic consumer, reflecting the continued results of larger appliance use and increased accuracy of reporting. This increase in use more than offsets the comparative falling off in new customers, so that the total number of kilowatt-hours sold for domestic service shows a record gain of 1,100,000,000, or 14.9 per cent over 1927.

Partly because of this enlarged use and partly because of the industry's general policies, the average price of domestic service has declined by 2.5 mills per kw-hr., or by 3.7 per cent during the year, leaving the average revenue per customer only 3 per cent above what is was in 1927. Combining the results of this table with those of the Rate Research Committee and other studies by the Association, the following changes in the cost and use of domestic service have taken place since 1914:

TABLE V—DOMESTIC ELECTRIC SERVICE

Year	Average Use, Kw.-hr.	Average Annual Bill	Average Price Paid Per Kw.-hr.
1914	268	$22.25	8.30c.
1922	359	26.50	7.39
1926	404	28.26	6.99
1927	429	29.20	6.80
1928	459	30.10	6.55

Due, in part, to a general tendency toward lower rates and, in still greater measure, to increased industrial activity over the previous year, the average revenues received per kilowatt-hour sold for commercial purposes showed a slight decline over the rates of 1927. Average revenues from small light and power sales decreased by 0.3 mills, or by 0.7 per cent, and those from large light and power decreased by 0.6 mills, or by 4 per cent.

Rates are constructed to fall with the increase in the quantity used per customer. Thus, in years of prosperity the proportion of power sales in the grand total rises while its average price drops; in years of slackened operations, the proportion of power drops while its average price rises. No argument can therefore be maintained upon the comparative prices, trends or proportions between domestic and commercial electricity, unless the relative industrial activity of the country is considered.

Farm Service—Table VI

The Association has again attempted this year to collect statistics covering the amount of electricity used by agricultural consumers. Table VI shows the

TABLE VI
FARM SERVICE AS INDICATED BY 125 COMPANIES REPORTING

Classification	Number of Customers Reported	Kilowatt-hours Sold	Revenue	Annual Average per Customer Kw-hr. Sold	Annual Average per Customer Revenue	Average Revenue per Kw-hr. Sold
Farms involving irrigation............	68,811	1,007,144,000	$15,510,000	17,000	$263.50	1.55c
Farms not involving irrigation.........	107,102	59,620,000	4,361,000	674	49.20	7.30c
Total..........................	175,913	1,066,764,000	$19,871,000	......	......	....

In the preparation of Table III (commercial statistics—sales of electricity), farm service not involving irrigation, as set out above, has been included in "domestic service" while farm service involving irrigation has been included in "commercial service—large light and power (wholesale.)"

kilowatt-hours sold and revenues paid for this energy as recorded by those companies which were able to report farm service as a separate classification. This table may, therefore, be considered merely as a cross-section of rural electric service. It does not show the totals for the entire country, as the bulk of the business is still included by many companies under the single classification of "domestic service."

Farm service in the United States is broadly divisible into two distinct classifications: (a) service on irrigated lands and (b) service on non-irrigated lands. The first classification applies to practically the entire country west of the 100th meridian (i. e., the Pacific and Mountain States, plus the western parts of the Plains States, roughly outlined by the "dead line" of 20-inch rainfall of old pioneer days) and to the States of Texas, Arkansas and Louisiana. The second classification embraces the rest of the country, although the increased use of electric-pumps for irrigation is generally noted not only in semi-arid regions but also in those of considerable (though seasonal) rainfall. For the reason that irrigation pumping is an item of such magnitude as to completely mask all other agricultural operations, Table VI has been set up in two divisions, the second one of which is representative of the average performance of the average farm.

It is gratifying to note, and is of hopeful significance for the future, both of agriculture and of the electric light and power industry, that, as reported by the 125 companies that have been able to keep separate records of their actual performance, the use of electricity per farm is already considerably in excess of urban domestic requirements.

TABLE VII
SOURCE AND DISPOSAL OF ENERGY

Source of Energy		Kilowatt-hours
Generation—		
By fuels		49,381,786,000
Water power		32,486,634,000
Total generation (net)................................		81,868,420,000
Energy from Other Sources—		
Excess of imports from Canada over exports (a).........	1,157,624,000	
Net energy received from various Federal, State, and District projects and from industrial plants..............	1,269,383,000	
Total energy from other sources............................		2,427,007,000
Total energy available for distribution.......................		84,295,427,000
Disposal of Energy		
Sales to ultimate consumers (see Table II).........................		68,104,555,000
Used in other departments..............................	1,341,780,000	
Used in electric raidway department.....................	1,128,544,000	
Total company use..		2,470,324,000
Total accounted for...		70,574,879,000
Balance unaccounted for (losses, etc.)............................		13,720,548,000
Total energy distributed..		84,295,427,000
INTER-UTILITY TRANSACTIONS		
Purchased or Transferred Energy Received		
Imported from Canada (a)...........................	1,356,453,000	
Received over State lines.............................	9,080,000,000	
From other electric companies within State lines..........	10,167,565,000	
From other sources (manufacturing plants, public works, etc.)	1,269,383,000	
Total energy received..		21,873,401,000
Energy Sold or Transferred for Resale		
Exported to Canada.....................................	198,829,000	
Exported over State lines...............................	9,080,000,000	
To municipalities within State lines......................	964,524,000	
To other electric companies within State lines............	9,203,041,000	
Total energy for resale..		19,446,394,000
Net energy received from other sources........................		2,427,007,000

Source and Disposal of Energy—Table VII

Of the total energy available during the year 1928 for distribution to the public, 58.4 per cent was generated by fuels and 38.5 per cent by water power. The balance, or 3.1 per cent, was imported from Canada or received from Federal, State and District hydro-electric projects or from industrial enterprises which were not public utilities. These figures show a rise in the proportion of water power in the total of distributable energy, which is the result, in part, of a year of comparatively more copious rainfall and of better stream flow and, in part, of the commencement of operations of one very large new hydro-electric installation. Due, however, to the increasing efficiency of steam-electric generation and to the numerous economic factors which follow in its train, it is to be doubted that this represents a trend which will persist.

Fuel Used in Electrical Generation, Table VIII

Table VIII gives a summary of the fuel used by all the electric light and power plants of the country during 1928. These produced 49,392,000,000 net kw-hr. through the consumption of fuel equivalent to 42,633,000 short tons of coal. This indicates an average net use of 1.73 pounds of coal per net kw-hr. generated, as against an average of

1.79 pounds in 1927 and of 1.89 pounds in 1926.

TABLE VIII

FUEL USED FOR ELECTRICAL GENERATION—1927

Coal (anthracite and bituminous, in short tons)	37,616,000
Oil (in 42 gal. bbls.)	6,834,000
Gas (in 1000 cu. ft.)	76,903,000
Total fuel (including small amounts of fuels not shown above) in equivalent short tons of coal	42,633,000
Energy generated by use of fuels	49,382,000,000 kw-hr.
Pounds of coal (or its equivalent) per kw-hr.	1.73 lb.

Transmission Lines, Table IX

Table IX shows the circuit miles of transmission lines of companies reporting to the N. E. L. A., grouped according to their major classifications. In addition, there are shown the individual voltages in most common use, as reported by identical companies during the past three years, and a comparison of the proportion of lines carrying these voltages to the total mileage. Of the voltages in most common use, the largest rate of growth is indicated in lines carrying 66,000 volts, which now comprise 15 per cent of the total mileage. It is gratifying to note that there is a steady trend toward the adoption of voltages recommended as standard and a corresponding decline in the proportion of lines carrying odd voltages.

TABLE IX

TRANSMISSION LINES OF COMPANIES REPORTING TO N. E. L. A.

Voltage (U. S. Census Classifications)	Circuit Miles 1928	Circuit Miles 1927
11,000 but under 33,000 volts	49,745	48,587
33,000 but under 66,000 volts	48,405	41,171
66,000 but under 110,000 volts	24,378	22,244
110,000 but under 220,000 volts	16,016	14,699
220,000 volts or more	2,980	1,257
Total	141,524	127,958
Estimated national total	150,000	......

VOLTAGES IN COMMON USE

(For Identical Companies Reporting by Voltages in 1926, 1927 and 1928)

	1928		Per Cent of Total Reported		
Voltage	Number of Companies Reporting	Circuit Miles Reported	1928	1927	1926
220,000**	3	1,590	1.4	1.2	1.2
132,000**	34	3,878	3.5	3.7	2.9
110,000*	32	7,577	6.8	7.4	7.9
66,000**	79	16,943	15.3	14.5	13.8
60,000	16	6,316	5.7	6.1	5.3
44,000*	24	5,503	5.0	5.4	5.3
33,000**	95	19,191	17.3	17.4	18.3
22,000*	66	6,341	5.7	6.2	5.1

11,000*	58	7,176	6.5	5.9	5.8
All other voltages above 11,000	147	24,425	22.0	22.2	23.5
Total reported	617	110,916	100	100	100

*Recognized as in common use by the International Electrotechnical Commission.

**Preferred for standard by United States National Committee of the International Electrotechnical Commission.

Sales of Merchandise—Table X

Table X shows the total gross receipts from sales of the merchandising departments of the electric light and power companies of the country. The grand total of $119,330,000 is nearly $20,000,000 more than the $99,866,000 reported last year. Of the total business done, 8.9 per cent was in lamps, 76.5 per cent in appliances, while the balance was in jobbing and miscellaneous electric sales. These ratios are substantially unchanged from last year.

TABLE X

GROSS SALES OF MERCHANDISE—1928

Electric lamps	$10,610,000
Electric appliances	91,960,000
All other electric sales	16,760,000
Total	$119,330,000

New Construction—Table XI

Table XI gives the distribution of actual 1928 construction expenditures and the budget for 1929, as estimated for the total electric light and power industry. These are substantially the same as in previous years. The proportion of expenditures for hydro-electric generation is showing a steady decrease from 8.7 per cent in 1927 to 8.1 per cent in 1928 and 7.5 per cent proposed for 1929.

It will be noted that the sums devoted to power plant construction comprised in 1928 about 25½ per cent of the total; for transmission lines and substations about 31 per cent; while expenditures for the distribution system took up about 28 per cent, or more than that devoted to generation.

TABLE XI

1928, 1927 AND 1926 CONSTRUCTION EXPENDITURES AND BUDGET FOR 1929 TOTAL ELECTRIC LIGHT AND POWER INDUSTRY

	1928 Gross Construction Expenditures	1929 Budget	1927 Gross Construction Expenditures	1926 Gross Construction Expenditures
Steam generating stations	$136,500,000	$160,600,000	$156,360,000	$189,058,000
Hydro generating stations	56,300,000	64,000,000	69,268,000	47,399,000
Substations	107,000,000	112,700,000	118,877,000	121,019,000
Transmission	125,100,000	147,200,000	140,573,000	115,946,000
Distribution	211,800,000	241,800,000	219,962,000	206,209,000
Miscellaneous electric	116,800,000	64,100,000	88,704,000	92,884,000
Total for electric operations	$753,500,000	$790,400,000	$793,744,000	$772,515,000

ACCOUNTING SECTION

W. R. EMERSON, *Chairman* FRED W. HERBERT, *Accounting Director, N. E. L. A.*

Machine Accounting Systems for General Books and Records

IN order to determine to what extent machine accounting systems for general office purposes, as distinguished apart from customers' billing and record keeping, have been developed in our industry, it seemed necessary to make an exhaustive survey. K. B. Crumb, Chairman of the General Records Committee of the Accounting National Section, sent a questionnaire to all member companies asking for information on this special subject. The replies from companies using machine accounting methods indicated general satisfaction, and the intention was to incorporate this survey in a serial report by this committee. The volume of detail and the varied results obtained by the companies is so diversified that it does not permit of tabulation in a report. However, this detail is on file at N. E. L. A. Headquarters and is available as to specific companies and machines.

The report in summary form is as follows:

Mechanical systems for the purposes of keeping consumers' records, preparing, addressing and postal stamping bills, which have been developed to a great extent in the past few years, are now in general use. The benefits that have resulted in reduced costs, neater records, elimination of peaks, etc., are known.

Machine accounting systems for the general books and records have not been developed to the same extent. They appear to be in the experimental stage. That systems for consumers' accounting have been perfected and are in general use, while such systems for general accounting appear to be in embryo, is, no doubt, due to the fact that general office accounting entails the use of a greater number of records and requires a variety of operations. It is, therefore, more involved for adaptation to machines. Also it is probable that the manufacturers saw a greater market for machines in the consumers' accounting field and their first efforts were naturally along this line.

Some of the larger utilities, with the aid of the manufacturers of machines, have developed machine systems that are superior to hand written methods. In order that it might be known to what extent general office machine accounting is now being used, and to awaken the interest of all accountants in the industry in this means of further reducing costs, thereby creating a demand that is bound to be recognized by the manufacturers and give stimulus to further development toward perfected systems, the member companies were solicited for information as to systems now in use.

Since nearly one-half of the member companies responded, the replies that were received are summarized below and are sufficient to indicate the trend.

Size of Company In Number of Consumers	*Machine Accounting Employed on General Books and Records* No	Yes	*Per cent Using Machine Accounting Systems*
1- 5000	79	2	2.5
5000- 10000	47	2	4.1
10000- 25000	39	9	18.7
25000- 50000	32	9	22.
50000-100000	23	17	42.5
100000-500000	12	20	62.5
Over 500000	—	6	100.
Unclassified and Holding Companies	32	13	29.
	264	78	20.

From this summary it might be assumed that mechanical accounting has merits only for the larger companies. It is true, of course, that the amount of saving varies directly with the volume of work. Nevertheless there is another factor to be considered. Most of the machine installations now in use have been adopted, not in the original instance as standard equipment of proved merit, but as results of experiments within the organization using them. Such development work is expensive, and the results at first are not certain. The larger companies being in better position to experiment are the ones employing such systems before these have become standardized.

It is apparent that as a result of such experimental work machine accounting systems of proved merit are now beginning to appear.

Wisconsin Accountants Meeting

INSTEAD of discussing merely the technical accounting aspects of the industry, the program of the convention of the Accounting Section of the Wisconsin Utilities Association held in Sheboygan, June 20 and 21, included papers, addresses and reports analyzing and setting forth the general problems of the industry.

The convention attracted about 100 delegates. A. J. Bohl, auditor of The Milwaukee Electric Railway and Light Co., was elected chairman, succeeding Louis T. Smith, J. E. Gray, auditor of the Wisconsin Power and Light Co., Madison, was elected vice-chairman.

G. W. Van Durzee, president of the Wisconsin Utilities Association, spoke on the necessity for finding out what the public wants, and conforming to those wants as far as practicable.

Howard L. Smith, certified public accountant, Madison, made a talk on "Some Differences between Municipally Owned and Privately Owned Public Utilities."

A paper by W. C. Beckjord, vice-president and engineer of the American Light and Traction Co., asserted that more workable contacts between engineers and accountants should be developed for the purpose of joint understanding of mutual problems and the elimination of the outstanding points of difference between accountants and engineers.

A. J. Bohl, auditor, the Milwaukee Electric Railway and Light Co., Spoke on the subjects of "Depreciation and Replacements."

G. C. Methews, Director of the Statistical Securities Division of the Wisconsin Railroad Commission, spoke on "Recent Tendencies in Utility Consolidations."

K. R. Boyes, secretary of the American Gas Association, stated that there are probably better and more educational facilities in the United States available to the working man than in all the other countries of the world. The speaker stressed the importance of training understudies to fill vacancies within the organization when they occur, declaring it is a reflection on the company's manager when he goes outside to seek a man to fill a vacancy.

C. E. Kohlhepp, Treasurer of the Wisconsin Public Service Corporation, Milwaukee, speaking on taxation, asserted that utilities in general in Wisconsin are paying a greater amount of their net income in taxes than utilities in surrounding states. Utilities in Wisconsin are paying approximately 34 per cent of their net in taxes, and the industries in Wisconsin are paying about 21 per cent, indicating clearly, he said, that utilities are now paying higher taxes than other industries and that the proposals in the legislature to further increase utility taxes by approximately $1,300,000 are unjustified.

Other speakers and their subjects were: "Gas Rates and Ratemaking," Ewald Haase, Milwaukee; "Some Problems of the Classification of Accounts," John Dockendorf, Milwaukee; "Field Accounting on Construction of High Pressure Gas Transmission Lines," John I. Allen, Racine; "Methods of Handling Customer's Request for Service," Paul A. Hoffman, Milwaukee.

Electrical Apparatus Committee Meeting

By T. G. Le Claire

Vice-Chairman Publication Sub-committee

THE Electrical Apparatus Committee held its final meeting for the administrative year on May 2 and 3 at Asbury Park, N. J. Chairman of the Committee, J. Allen Johnson, presided at these meetings. The program was a large one, devoted to rounding out the business of the year. The topics handled can be briefly summarized as follows:

Hydrogen Cooling for Machinery

The Generating Station Subcommittee, of which C. A. Harrington is the Chairman, presented a symposium on the use of hydrogen as a cooling medium for rotating electrical machinery. According to the speakers of this symposium, hydrogen cooling has the following advantages over air cooling:

1. Lower operating temperature
2. Decreased windage loss
3. No fire hazard
4. Increased life of insulation
5. Decreased corona damage
6. Quieter operation.

The early machines built for hydrogen cooling were made explosion-proof so that, should an explosive mixture of hydrogen and air be ignited within the machine, the shell would not be wrecked. Some of the newer machines are, however, not built explosion-proof, and greater attention is paid to keeping the concentration of hydrogen outside the explosive limit, which is between 10 per cent and 70 per cent by volume. Several machines have recently been built for hydrogen cooling, including a 12,500 kv-a. synchronous condenser and a 62,000 kv-a. generator.

With the use of hydrogen at approximately atmospheric pressure as the cooling medium in the machine, the rating of a synchronous condenser is increased approximately 25 per cent over that of the corresponding machine with air for cooling. If the pressure of this hydrogen is raised to 15 lb. per sq. in., the rating of the machine can be increased another 30 per cent over the corresponding rating with the hydrogen at atmospheric pressure. The consensus of opinion is that for high speed synchronous condensers, where it is not necessary to seal a rotating shaft, the cost of applying the hydrogen cooling is less than the value of the additional rating obtained on the machine. This advantage is further augmented by the fact that the hydrogen-cooled machine, being totally inclosed, can be installed out-of-doors, and the cost of inclosing building is thereby saved.

For machines such as turbo-alternators where a rotating seal must be maintained, the additional cost of this sealing and the supply of hydrogen to compensate for leakage makes the economy of the hydrogen over air cooling less apparent. Development work is rapidly going forward, and these machines will undoubtedly be much improved in the near future.

Neutral Grounding Impedances

The Generating Station Subcommittee also presented a discussion on neutral grounding impedances. Speakers having different types of systems presented the features of various grounding practices.

System Operation

The Operating Practice Subcommittee, of which P. B. Juhnke is Chairman, presented a symposium on the operation of typical high-voltage systems. The Public Service Electric & Gas Company uses a 132 kv. transmission system, which is at present divided into two parts, one of which is tied in with the 220 kv. system of the Peoples Power & Light Company and the Philadelphia Electric Company, and the other half is interconnected with the Philadelphia Electric Company, Delaware Station. The transmission lines are double circuit, using balanced relays which are backed up by overload relays with a long-time setting.

The Southeastern Power & Light Company system consists of a large number of relatively small stations scattered over a wide area and connected to a complicated network of transmission lines. Most of these lines consist of double circuits at 110 kv. protected by differential relays. The single circuit lines are protected by directional relays. Frequency on this system is automatically controlled within 1/20 cycle by the automatic governing of 60,000 kw. in generating capacity with load variations of 15,000 plus or minus.

The Commonwealth Edison Company system consists of five stations, very close together and interconnected by 66,000 volt lines. These high-voltage underground lines are protected by pilot wire relays.

On one 132 kv. system, which is not protected by lightning arresters there were no interruptions due to lightning, while on another system during the past year there has been one line opening for every three miles of circuit.

Several interesting cases of system trouble were discussed. On one system it was found that 35 per cent of line trouble involving parallel circuits caused the interruptions of both the circuits, but that ordinarily one can be restored very promptly.

Standardization

Several interesting speakers gave a general discussion on the various aspects of standardization. Their discussion can briefly be summarized as follows:

Probably the most important types of standards are those of quality, which serve as a basis for accurate commercial comparison of products supplied by different manufacturers. Standards of performance rating might be considered in this class. For electrical equipment the most fundamental standards are those of characteristics, such as voltage, frequency and the like.

Simplification standards have for their purpose the fixing of a few sizes which will reduce the number of different items to be manufactured and carried in stock. These simplification standards reduce manufacturing costs by making for quantity production. The effect of these simplification standards is that each article in itself is probably better built and cheaper than it would otherwise be, but is not so closely adapted for the individual application as would be a special design.

Codes, such as the fire code, the safety code and the like, involve large numbers of people and many diverse interests. They must be very carefully considered before being put into effect, since they are of quasi-legal type and once established are difficult to keep in step with technical developments.

Standards are intended to make for progress, and it should, therefore, be understood that standards must be flexible and subject to change. The standard is desirable for reducing costs, but it would be very undesirable if it persisted in use after later developments make new practices more desirable.

Utilization Voltages

The Utilization Subcommittee, of which L. B. Bonnett is Chairman, has reconsidered the question of utilization voltages since the Memphis meeting. The report of the Lamp Committee for 1928 indicates that nearly half of the lamps purchased were for 115 volts and over one-third for 120 volts, but that very few were purchased for 110 volts. Comparison of the figures for 1927 and 1928 indicates a slight decrease in the percentage of sales of 115 volt lamps and a corresponding increase in that of 120 volt lamps. It was brought out in discussion that immediate redesign of appliances and small motors was neither desirable nor necessary.

Currents and Voltages That Do Not Register on the Watt-Hour Meter Being Measured by Joint Committee

THE perfection of almost any of man's endeavors is dependent on the development of standards of measurement and ready means for measuring the unit quantities involved. The earliest history of man in regard to his trade relations tells of the barter between individuals in the trade of the goods that one possesses for the goods that another possesses. As trade developed mediums of exchange were established, with which the values of various goods could be measured. These mediums of exchange were first local in the form of beads, shells and various other trinkets. Later they developed a national character, and now gold as a measure of economic value is almost universally accepted throughout the civilized world.

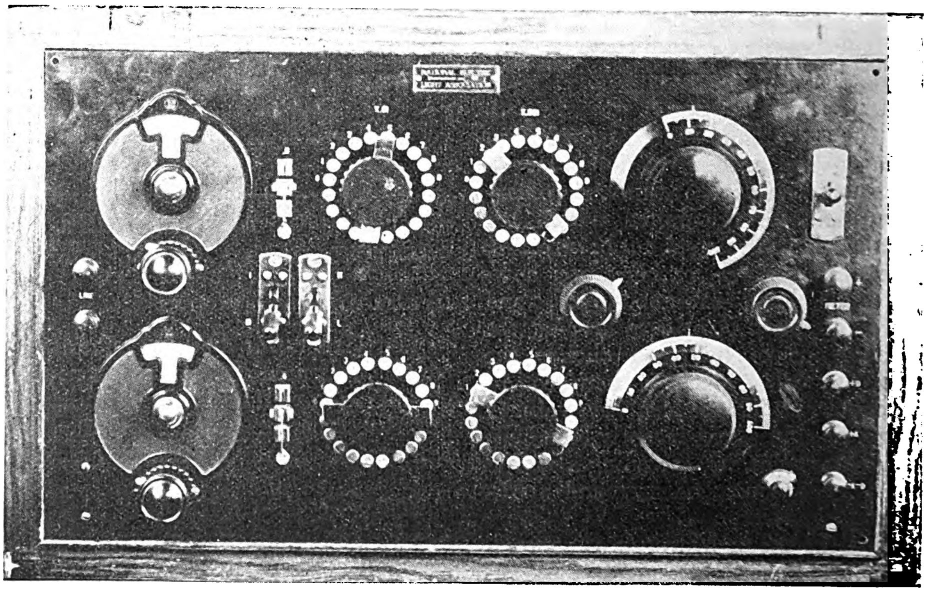
Dependence Upon Measurements

The development of any science or art can be traced with the development of its associated measurements. The Meter Bar preserved in Paris by the French Government is universally accepted as a basis for measurements by most of the civilized world. However, men worked for a long time before this single standard of length was evolved. The first central station for the generation of electrical energy did not possess any meters with which it could measure the amount of its product that was delivered to the various customers. Therefore, it was necessary to base their charges on the number of lights connected to the circuit with little regard to the time each light was burned. The same method was later used in the charge for fan service. Today the revenue of the central station industry is almost entirely dependent on the measurements of watts, volts and amperes on accurate low-priced instruments. We could not conceive of the present central station industry operating without the little watthour meter for every customer.

In 1922, when the Principles and Practices Subcommittee prepared their report for the guidance of the telephone and power industry in their mutual relations, they recognized that the susceptiveness of the telephone circuits, coupling between power and telephone circuits and influence of the power circuits were the three fundamental physical factors involved. However, there were no means available for the ready measurement of many of these factors, and it has required considerable time to determine the exact quantities which should be used as a basis for measuring these factors, and also for the development of measuring equipment which could be used outside of the laboratory for their determination.

Harmonic Analyzers Developed

The influence of the power system is largely dependent upon the arrangement of the conductors and the magnitudes and frequencies of the various harmonic currents and voltages present. The oscillograph was used in the early days of the development of the art of inductive coordination for the determination of the harmonics present in a given current or voltage wave. This instrument had very serious limitations for these determinations. A 1 per cent harmonic of 900 cycles has far more influence on telephone circuits than a 10 per cent harmonic at 180 cycles. However, the oscillograph would clearly show the latter, and the former would be almost entirely lost. To meet this situation numerous means were devised for measuring directly the harmonic currents present in an electrical circuit. Under the direction of the Joint D & R Subcommittee, several harmonic analyzers* have been developed to be used in connection with its work. Each of these has proved of aid in the solution of the various problems. A small portable analyzer,** which has sacrificed accuracy to a slight extent for portability



Harmonic Analyzer Used in Connection with Wave Shape Survey and ease of operation, has provided a means for measuring the harmonic currents and voltages in a large number of power systems.

---

* AIEE Journal, June 1929.
** NELA Serial Report No. 278-22.

Project Committee No. 5[†] was assigned the task of determining the wave shapes of various types of transmission and distribution circuits throughout the country. It was also assigned the task of determining the effect of various types of rotating apparatus and various types of transformers upon the wave shape. After developing a means for measuring the harmonic currents and voltages, the next problem was the efficient use of this apparatus to obtain a cross-section of the conditions existing throughout the country in a reasonable time and with reasonable accuracy. In order to accomplish this, a survey of the major power systems in the eastern part of the United States was embarked upon. The personnel available to the D & R Committee was extremely limited, and if all measurements were to be made by their own personnel several years would be required to obtain the necessary results. The Project Committee decided to conduct this survey, using its own personnel to lay out programs of measurements and to educate power company personnel to use the apparatus and make the necessary measurements. Wonderful cooperation has been received from a large number of companies, and in about one year's time data have been collected which will show the average conditions prevailing, as well as the maximum and minimum conditions encountered.

Field Work

A little over a year ago The Philadelphia Electric Company was approached, the plans of the Project Committee explained in detail and their cooperation secured. This gave an opportunity to use the equipment in the making of all the necessary field measurements on a large transmission and distribution system. In this case the entire program was carried out with the assistance of Headquarters engineers. The report giving the results of this survey was then sent to a number of power companies in order to show the types of measurements that were required, and the results that the committee desired to obtain for each system.

Wave Shape surveys have been completed on the following power systems:

Philadelphia Electric Company
Georgia Power Company
Public Service Electric & Gas Co.
Connecticut Light & Power Co.
Edison Electric Illuminating Co. of Boston
Niagara Falls Power Company
Cumberland County Power & Light Co.
Central Maine Power Company
Hartford Electric Light Co.
Virginia Electric & Power Co.
New Orleans Public Service, Inc.
Memphis Power & Light Company
Oklahoma Gas & Electric Co.
Texas Power & Light Co.
Dallas Power & Light Co.
Kansas City Power & Light Co.
Union Electric Light & Power Co.
West Texas Utilities Company
Southwestern Gas & Electric Co.
Gulf States Utilities Co.
Birmingham Electric Co.
Houston Lighting & Power Co.
Appalachian Electric Power Co.
Carolina Power & Light Co.
Louisville Gas & Electric Co.
Kentucky Utilities Co.
Potomac Electric Power Co.
Pennsylvania Power & Light Co.

In addition the following companies have also signified their willingness to cooperate with the Project Committee in its work:

Utah Power & Light Co.
Puget Sound Power & Light Co.
Consumers Power Company
Toledo Edison Company

The committee expects to secure the cooperation of several additional companies. As soon as this work is completed it is believed that sufficient information will be available to form a basis for determining the conditions, as far as wave shape is concerned, that will be encountered throughout the country. This information will form the basis for the development of more specific principles and practices. It will also materially assist in the solution of specific problems of noise induction between power and communication circuits, since these data will transfer one of the major factors from the column of unknown and assumed quantities to the column of known quantities. Fairly definite values of noise, therefore, can be estimated, and it will be much easier to construct transmission and telephone circuits without considerable misgiving on the part of the interested engineers as to the results to be obtained. Power companies will also know whether a new generator of a given wave shape will increase or decrease the inductive influence of their system. Similarly with any new type of apparatus, it will be possible to determine, before the apparatus is purchased, whether or not our problem of inductive coordination will increase or decrease with its use.

FIRST AID IN ADELAIDE

The gospel of First Aid is being spread in far off Australia through a member company who finds it convenient and economical to have N. E. L. A. Headquarters supply it with 150 illustrated charts of Resuscitation by the Prone Pressure Method. This chart (Publication No. 289-41) recently has been revised by the Accident Prevention Committee.

This Australian member company is the Adelaide Electric Supply Company of Adelaide, capital of South Australia.

Interchangeability of Insulating Oil

THE Westinghouse and the General Electric companies have agreed to the interchange of WEMCO-C and GE-1OC oils in circuit breakers as well as in transformers when supplied by approved refiners, with certain reservations in the case of oil circuit breakers. The General Electric Company will approve the use of WEMCO-C in circuit breakers having separate chambers, gasketed tanks and other non-oil throwing features with the understanding that WEMCO-C oil as regularly supplied by the Westinghouse Company has characteristics essentially the same as General Electric 10-C and that their specifications and supervision compare favorably with those under which General Electric 10-C is supplied. The Westinghouse Company will approve the use of General Electric 10-C oil in all oil circuit breakers provided that the General Electric 10-C is furnished by approved refiners.

The General Electric Company has announced that they will permit the use of 10-C oil in both their transformers and in oil circuit breakers of modern design equipped with non-oil throwing features, the only exception being that the lighter 10-C transformer oil is not recommended for use in old types of breakers which are not equipped with non-oil throwing features. The types of breakers in which 10-C oil may be used include types K-37, K-55, K-58, K-136, K-139, K-330 and all "H" types.

The Westinghouse Company has permitted the use of WEMCO-C oil in both their transformers and oil circuit breakers, indoor and outdoor types, since 1927.

Public Utility Points

THE ninth edition of "Public Utility Points," a 16-page pamphlet published by Bonbright & Co., 25 Nassau Street, New York, is now ready for distribution, and this company advises that copies up to 100 in number will be mailed free of charge to applicants. For pamphlets in excess of that number a charge of 3½ cents per copy will be made. Such topics as the accomplishments of the electric light and power industry, future possibilities, public and private ownership and statistics on the public utilities are discussed in the booklet.

[†] Of the Joint Subcommittee on Development and Research of the Bell Telephone System and the National Electric Light Association.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

North Central Electric Association Convention

MOVIETONES featured the Golden Jubilee of Light Convention of the North Central Electric Association at Breezy Point Summer Resort, Pequot, Mich., June 16-17-18, 1929. Matthew S. Sloan, President-elect of the National Electric Light Association, delivered an address to the convention through the medium of the talking-moving picture as a substitute for his personal attendance. It was very well received and perfectly coordinated. Talking movies of Thos. A. Edison, and Sir Ernest Benn, London publisher, were also shown.

L. M. Pharis, President of the North Central Electric Association, gave a detailed report of the past activities of the N.C.E.A. He mentioned as the most significant development the large attendance at the Group conferences of the Accounting, Commercial and Engineering Sections. This point of view was emphasized by the Chairmen of the respective Sections—C. J. Strike, Huron, S. D., Chairman Commercial Section; J. A. Colvin, Minneapolis, Minn., Chairman Engineering Section, and W. S. Hodgson, Duluth, Minn., Chairman Accounting Section.

O. S. Powell, Federal Reserve Bank, Minneapolis, gave an interesting picture of the Northwest business developments and stated that this section was improving more rapidly than most of the country at the present time.

W. H. Rademacker, Edison Lamp Works, Chicago, presented detailed plans for celebrating the Golden Jubilee of Light in each local community.

C. W. McDonnell, Chairman of the Board of Railroad Commissioners, Bismarck, N. D., spoke of the problems confronting regulatory bodies.

One of the outstanding talks of the convention was an illustrated talk by T. D. Crocker, Northern States Power Co., Minneapolis, on "Trading Places with Ontario." Mr. Crocker compared the conditions existing in Minnesota with the Ontario Hydro-Commission plant and showed by well worked out figures that if Ontario had the same water conditions as Minnesota, Ontario rates would have to be twice as high.

The five Group Conferences on the morning of June 18, were very successful. In the Engineering Conference, "Radio Interference" was given considerable attention. The speakers thereon were: L. A. Grettum, Winona, Minn.; R. A. Farmer, Minneapolis, Minn.; B. H. Clingerman, Minneapolis, Minn.; A. S. King, Fargo, N. D., and F. S. Rice, Duluth, Minn.

W. H. Brown, Minneapolis, led the discussion on "Accident Prevention," C. W. Place, Electrical Engineer, General Electric Co., Chicago, talked on "New Engineering Developments."

The outstanding talk of the Commercial Section was "Fundamentals of Store Management," by W. E. Koch, Business Counselor, Kansas City, Mo.; R. R. Herrmann, University of Minnesota, Minneapolis, gave an interesting presentation of the effects of Promotional Rates on water heating.

The Women's Section, under the direction of Mrs. Mabel Wilson, had the following program: "Debunking the Housekeeping Martyr," Miss Eloise Davison, N. E. L. A., New York City; "Organization Problems," Miss Mae Brooker, Dubuque, Iowa; "Past Activities," Miss Lillian Swanson, Huron, S. D. There was also a round table discussion on "Company Service," led by Miss Columbia Tielebein, Mitchell, S. D., and Mrs. Claire Harley, St. Paul, Minn.

Excellent talks were given by Paul S. Clapp, Managing Director of the N.E.L.A.; Fred Herbert, Service Director, N.E.L.A.; Miss Isabell Davie and Miss Eloise Davison of the Women's Department of the N.E.L.A.; and Major H. S. Bennion of the Engineering Department.

Monday and Tuesday afternoons were spent in athletic and social diversions, with more than 100 playing golf. W. S. Heald, sales manager, Minnesota Power & Light Co., Duluth, Minn., acted as toastmaster at the banquet Tuesday night, and distributed the 40 or more prizes for convention stunts.

The speaker of the evening was Dr. J. T. E. Dinwoodie, editor of *The Dakota Farmer,* Aberdeen, S. D., whose subject was "How a Newspaper Man Looks at the Electrical Industry." Dr. Dinwoodie stated that in his judgment the electrical industry had not really started, and he was expecting a great deal from the industry in the future.

A masquerade party was held on Monday evening, and a Specialty Dance on Tuesday evening. The dances were named after the different jobbers and manufacturers who presented stunts and prizes during their dance.

The weather was delightful during the entire convention, and about 350 were in attendance.

The new officers elected were:

Thomas T. Parker, Northwestern **Public Service Co., Huron,** S. D., President; **B. W. Cowperthwait,** Northern States Power **Co., Fairbault, Minn.,** Vice-President; **J. A. Hennessy, Northern** States Power Co., **Minneapolis, Minn., Treasurer;** T. D. **Crocker, Northern States** Power Co., **Minneapolis, Minn.; W. S. Heald,** Minnesota Power **& Light Co., Duluth,** Minn.; **C. S. Kennedy, Otter Tail** Power Co., Fergus Falls, **Minn.; Frank Milholland,** General West **Public Service Co., Omaha,** Neb.; George E. **Taylor, Interstate** Power Co., Dubuque, Iowa.

Missouri Association Convention

MEETING for business in the mornings only — an innovation that proved popular—the Missouri Association of Public Utilities held its twenty-third annual convention at Sedalia on May 16 to 18. President A. E. Reynolds presided. It proved an entirely successful and interesting gathering, with a well-balanced program and 200 in attendance. A special committee was authorized to cooperate in the celebration of "Light's Golden Jubilee," following an address on that subject by R. B. Obermeyer of Kansas City.

One of the principal addresses concerning the electrical industry was made by Walter E. Bryan, superintendent of power for the St. Louis Public Service Company—an electric railway utility. Mr. Bryan's subject was, "The Largest Individual Power Consumer," meaning the street railway, and he pointed to the value of the latter to the power company because of its purchase of 25-cycle power, thereby enabling the power company to keep equipment in service which would otherwise have to be shut down and the loss borne by light and power customers.

Mr. Bryan's address was followed by an open forum at which various subjects were discussed informally.

At Friday's session G. W. Weston of Kansas City spoke on the national "red seal" plan, declaring that the real problem is to get the great mass of homes adequately wired—a problem which, he suggested, could be met by cooperation with builders of low-priced houses.

At the annual banquet and carnival E. E. E. McJimsey, associate editor of the Springfield *Daily News,* discussed the advantages of a close cooperation and mutual understanding between public utilities and the public press.

Officers elected are: President, **T. J. Strickler, Kansas City** Gas Company; **first vice-president, E. D. V.** Dickey, **Hannibal; second vice-president, H.** Patton, St. Louis; **third vice-president, A. E.** Bettis, **Kansas City; secretary, F. D. Beardslee (reelected); treasurer, Herman Spoehrer.**

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* **Miss Isabell Davie**, *Secretary*

News Letter

By Mrs. Thelma Van Ness

MEMBERS of the Women's Committee, Home Service Subcommittee and Manufacturers Subcommittee from all over the United States attended the recent meetings for these groups, held in connection with the N. E. L. A. Convention at Atlantic City June 3 to 7. Although most of the women came from the eastern half of the country, nevertheless the Pacific Coast, Northwest and Southwestern Divisions sent representatives who contributed their share to the meetings.

The National Women's Committee, the Home Service Subcommittee and the Manufacturers Subcommittee each convened for separate meetings at 9:30 Monday morning, June 3, and joined for a short meeting at 10:30 o'clock.

The open meeting for women was held in the Garden Lounge, Dennis Hotel, Monday afternoon, June 3, at 3 o'clock. This meeting was presided over by Miss Sophia Malicki, Chairman, Women's Committee, and was addressed by speakers of various interests.

Miss Ada Bessie Swann, Chairman, Home Service Committee, told of the efforts of her Committee during the past year, and made recommendations for future work.

A talk by Miss Fern Snider, Monongahela West-Penn Public Service Company, Fairmont, W. Va., concerning Home Service, brought out many interesting points, chief of which was the plea that future Home Service work be forwarded on a broad scale covering all possible applications of electricity to homemaking.

Miss Frances Weedman, Edison Electric Appliance Co., Chicago, Chairman, Manufacturers Subcommittee, discussed the plans for this group. A collection of educational material available from manufacturers of electrical household equipment has been made by her Committee. Information concerning it can be procured from her.

A discussion of the Short Courses for women in the electrical industry, which have been held and are now contemplated by colleges and universities, was given by Miss Eloise Davison, Home Economics Advisor, National Electric Light Association.

Mrs. Sarai Waugh, Westchester Lighting Company, Mount Vernon, N. Y., told of the activities of Home Lighting Specialists and urged that home lighting be not slighted in the programs of Home Service departments and Women's Committees.

The plans for "Light's Golden Jubilee" were presented by Miss Sara Harris, Utica Gas & Electric Company, Utica, N. Y.

Miss Mary L. Johnston, National Federation of Business and Professional Women's Clubs, a guest of the Women's Committee to the Convention, explained the purposes and work of the Federation.

A talk of especial interest to all present was made by Mrs. Charles E. Gregory, Educational Director, Home Center, New York Federation of Women's Clubs, in which she told of the planning and building of the Permanent Home Making Center which was recently opened. Mrs. Gregory stated that this is the first time that a large institution has been set up as a definite place for the all-around study of home and home problems, where a continuous program of information and instruction is carried on. Mrs. Gregory extended an invitation to all members of the Women's Committee to visit the Home Center.

A brief talk on an international movement for the betterment of homes was made by Miss Dorothy Dignam, who has just returned from abroad.

Miss Isabell Davie told of the uses being made of the "More Power to the Home!" booklets by Women's Committees, Home Service Directors, Commercial Managers and others. She reported that about 150,000 of the booklets had been distributed.

* * *

Miss Sophia Malicki, Chairman of the Women's Committee, and Miss Helen Norris, Member-at-Large of the Women's Committee, will attend a meeting of the Electrical Association for Women at Newcastle-on-Tyne, England, in July. Miss Malicki, who is affiliated with the Middle West Utilities Company, Chicago, will speak on "The Modern Development of Electricity As It Affects Women." Miss Norris is Dean of Women of the Commonwealth Edison Company, Chicago.

* * *

Mrs. Hazel Roberts of the Wabash Valley Electric Company won the highest honors in the prize essay contest conducted by the Middle West Utilities Company in 1928, according to a late issue of *Power News* published in Indianapolis by the Interstate Public Service Company and the operating subsidiaries of the Central Indiana Power Company. A District, a Company, and a President's prize were offered for the best papers by employees on the subject, "What Our 1928 Public Relations Program Has Meant to Me." Mrs. Roberts of Clinton, Ind., who is secretary to C. M. Poor, Vice-President and General Manager of the Wabash Valley Electric Company, won all three prizes. The President's prize, given for the best paper written by an employee of any of the companies controlled by the Middle West Utilities Company, which operates in 29 states, was a trip to the National Electric Light Association Convention in Atlantic City this year. The Company prize is a trip to the convention of the Great Lakes Division at French Lick, Ind., in September. The District prize was $15 cash.

* * *

The Women's Committee of the Iowa-Nebraska Light & Power Company presented a skit entitled "Live and Help Live," by the girls' First Aid Team at the Middle West Division, N. E. L. A. Convention at Omaha recently. Members of the team are Miss Lydia Hild, Miss Vera Field of York and Miss Ellen Curran of Lincoln. The *Live Wire Newsette* is the name of the interesting little bulletin published by this group.

* * *

From a report of safety activities of the Southeastern Division Women's Safety Subcommittee, Miss Selma R. Cohn, Chairman, we learn that some exceptional work was done by the women following the hurricane at West Palm Beach. The women worked unceasingly to relieve suffering, assisting in the work of the First Aid Station established by the Florida Power & Light Company at its power plant. They also procured clothing and distributed it among members of employees' families. Miss Fletcher, in charge of the station, was given authority by the Red Cross to administer typhoid vaccine to company employees and hundreds of others in the city. Later, she was awarded a medal for giving her blood in a transfusion to the wife of an employee.

* * *

Mrs. Jane Pratt, Chairman of the Southeastern Division Women's Committee, reported that in the recent floods in the Southeastern states the utility women responded to an appeal which she made over the radio for food, clothing and money, in a manner which far exceeded expectations. Stations for collecting these donations were immediately established, and in less than 24 hours large shipments were on their way to the flooded section. These came from the larger communities. All of this work was done on Saturday and Sunday. Furthermore, the utility women contacted with the other women in their localities, through their club memberships, and started a movement among these women with like results.

* * *

Miss Esther Rockey, Chairman of the East Central Division, reports that the Women's Committee held regular sessions in connection with the Division Convention in Louisville beginning May 7. Miss Rockey sends out some very interesting letters to the local chairmen in her division as a means of stimulating interest in committee work.

* * *

The Women's Committee, Portland Electric Power Company, Portland, Ore., of which Miss Marguerite Butler is Chairman, entered six women in the Company Public Speaking Contest. There were twenty-one men contestants. Of the twelve persons receiving the highest rating, the women took first, second, third and eighth places. Two separate sets of judges graded the manuscripts and the delivery. Mrs. Gladys Robison won the first prize and will therefore represent the company at the convention in Seattle in June, at which she will compete with the winners from the other Northwest companies. Miss Louise Espey took second place; Miss Oleva Murphy, third, and Miss Alice Butz eighth.

* * *

In the Women's Committee Essay Contest of the Portland Electric Power Company, the subject of which was, "Pleasing Mr. and Mrs. Public," first prize was awarded to Miss Margaret Brady, second to Mrs. Coralyn Cathcart, third to Miss Margaret E. Fuller and the fourth to Mrs. Gladys Robison. Honorable mention was awarded to Miss Edna Harlocker and Mrs. Grace Parke. Twenty-two papers were submitted. Miss Brady's paper will be sent to the Chairman of the Women's Committee, Northwest Division, to be entered in competition with the winning papers from the other Northwest companies.

* * *

The Western District Women's Committee, Puget Sound Power & Light Company, made quite a record in a recent essay contest, every girl except one having submitted a paper. Miss Grace Morgan was awarded the $10 first prize.

* * *

According to the Women's Page of *Current Topics,* Miss Betty Ewing, editor, the First Aid class of the Topeka Women's Committee, the Kansas Power & Light Company, has been completed. Cash prizes were awarded by D. E. Ackers to the two teams giving the best demonstrations of the prone pressure method of resuscitation. The team winning first prize was captained by Miss Garnette Reynolds and the second prize team by Miss Dorothy Myer. First and second prizes were also awarded to Miss Nancy Potter and Miss Doris Armstrong respectively for the best first aid note books out of thirty-four entrants. Miss Elsie McMann is the State Chairman of Kansas.

* * *

The Illinois Power & Light Corporation Women's Committee at Granite City recently presented the playlet "How Jane Found Happiness" before the Matrons' Literary Club of Madison, Ill. The club's topic of the discussion for the meeting was "The Modern Home" and the playlet proved very appropriate for the occasion.

* * *

The Michigan Women's Committee Chairman, Miss Skulda Baner, of the Lake Superior District Power Company, Ironwood, spoke before the Ironwood Women's Club meeting in April, and also was one of the speakers at the annual Upper Peninsula District Federation of Women's Clubs convention at Negaunee, Mich., in May. At the Ironwood meeting Miss Baner selected "Color" as her topic of discussion and at Negaunee she spoke under the auspices of the American Home Department, on subjects pertaining to the beautifying of the home.

* * *

The Bulletin *Woco Sayso,* published by the Women's Committee of the Public Service Company of Colorado, has been incorporated in the new company magazine just issued by that organization. Miss Lorraine Anderson is the editor of the Women's Committee page, assisted by Miss Ruth Kraft.

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

The House Beautiful—June
- Lighting the Grounds—Fletcher Steele

House and Garden—June
- Progress with the Home Laundry—Elizabeth Hallam Bohn

Woman's Home Companion—June
- The Work of the World—Isabel Ely Lord
- Community Housecleaning — Anna Steese Richardson

Good Housekeeping—June
- Getting Good Refrigeration—Arthur J. Donniez

Delineator—June
- How To Launder Your Summer Wardrobe
- Color and Efficiency in the Kitchen

The Household Magazine—July
- The Home Plant Modernized—J. P. Martin

The American Home—July
- New Telephones and Cabinets—Vandy Cape

* * *

Oklahoma won the cup in the Efficiency Contest this year, which was conducted by the Southwestern Geographic Division, N. E. L. A. There were six points to the contest, as follows: Monthly Meetings, Attendance, Sale of Stock, Sale of Appliances, Public Contacts and Safety or First Aid Work. All committees, through the State Chairmen, reported monthly to the Division Chairman on the State Efficiency Cards. These cards were checked and all points figured from Oct. 1, 1928, to March 1, 1929. Miss Julie Pailet is the capable Chairman of this Division.

* * *

The Women's Committee of the Pacific Coast Electrical Association is publishing a bulletin—and it is a very clever little four-page pamphlet. All it lacks is a name, and the girls are anxiously searching for something appropriate. Mrs. Ruth E. Creveling is in charge of this Committee's activities.

* * *

Be sure to read all the splendid articles and news of other Committees in this issue of the N. E. L. A. Bulletin.

SPECIAL COMMITTEES

Growth of Street Lighting[*]

Street lighting is advancing at a rate which falls far below the increasing requirements of high speed traffic. Nevertheless there is some advance.

The Lamp Committee report for 1929 shows that the average lumens output of street series lamps for 1928 was 5.6 per cent higher than for 1927. This is one indication of the rate of advance.

Another indication is afforded by statistics of two central stations—one in the East and one in the Middle West—which show increases in recent years in kilowatt-hours sold for street lighting. These data are as follows:

	Increase in kw-hr. over those for 1922	
Year	*Eastern Co.*	*Middle Western Co.*
1923.......	10%	7%
1924.......	25%	9%
1925.......	40%	11%
1926.......	60%	15%
1927.......	76%	33%
1928.......	95%	83%

---

[*] Article submitted by Lamp Committee, Frank W. Smith, Chairman.

RELATED and other ORGANIZATIONS

Reorganization of American Committee, World Power Conference

DURING the last year the American Section of the World Power Conference has been reorganized on a permanent basis, and on July 1st will establish a permanent office and staff.

For some time it had been the opinion of many members of the Committee that if the United States is to take an appropriate part in the activities of the Conference, and if the American section is to serve adequately the international interests of the various branches of the power industry of the United States, a more permanent and effective organization would be necessary. Accordingly, on April 23, 1929, a group of individuals, representing the most important power, industrial and banking groups in the international field, were called together in New York to discuss the desirability of establishing permanent offices and staff, and the practicability of financing the undertaking. It was the unanimous conclusion that such an organization would be of undoubted value and that adequate financial support could be provided if Mr. O. C. Merrill, who had served as Chairman of the Committee since its organization in 1923, would be willing to resign his position as Executive Secretary of the Federal Power Commission and give his whole time to the work of the American Section.

Financial Support Guaranteed

On his agreement to do so, the necessary financial support was guaranteed for a period of five years, and permanent offices will be opened in Washington on July 1st. After the organization is under way and plans for participation in the Tokyo and Berlin Meetings have been completed, offices will likewise be opened in New York.

The permanent organization will have four specific objects in view: First; a more effective participation in the International sessions of the Conference. Since the meeting of 1924 in London, the American Committee has taken a comparatively small part in the several meetings of the Conference, due in part to the fact that no definite decision had been reached to organize for permanent membership in the Conference, and in part to the fact that the amount of time required for effective participation was more than could be given on a voluntary basis such as has hitherto existed. With a permanent office and staff better selection can be made of subjects and of authors, and there will be more certainty of representation at meetings of the International Executive Council. It will be particularly desirable to make adequate preparation for the Berlin meeting of 1930, which is likely to be the most important session of the Conference yet held.

Distributing Agency for Information

Second: To serve as an agency for collecting and distributing information on matters relating to power from the technical, statistical, economic, financial and legal standpoints. This will be done through organizing an interchange service with the National Committees of the forty-six participating countries. The permanent staff will also maintain close contact with the Bureau of Foreign and Domestic Commerce and will endeavor to assist that Bureau in making its information service of great value to the power industry. It is expected that this general service of information will later be enlarged by general or special investigations in foreign countries and by visits to those countries of members of the staff, thereby keeping interested persons and groups in the United States in touch with developments abroad.

Contacts with Other Countries

Third: The reorganized Committee should act as the medium through which the power industry of the United States makes its international contacts with similar foreign organizations. Since proposals are constantly arising for international organization of activities relating directly, or indirectly, to the power industry, it seems desirable that to the extent the United States participates in these organizations it should do so through the American Section of the World Power Conference.

Fourth: The Committee will act as a distributing agent in the United States of the Transactions of the various sessions of the Conferences and of any other publications that may be produced under the auspices of the International Executive Council. By handling all orders in a single consignment the minimum cost of transportation to the United States will be secured, and by importing in the name of the Committee customs duties are remitted and the inconveniences of individual customs declarations and clearance are avoided.

The first meeting of the World Power Conference was held in London in 1924. There were 1700 delegates in attendance, about 150 of whom were from the United States, and 39 countries were represented. This Conference dealt with the extent and character of power resources of the several countries and the degree to which they had been utilized; with the technical features of power production by water and by fuel, and of power transmission and distribution; with preparation of fuels and the design of prime movers; with utilization of electric energy in electrochemistry, electro-metallurgy, transportation, and for general industrial and domestic purposes; and with the social, economic, financial and legal aspects of power development and use.

The first meeting at London was a "plenary" session for which equal responsibility was taken by all participating countries. In addition "sectional" meetings have been organized on a more limited basis and with a more restricted program. One at Basle, Switzerland, in 1926, dealt with the physical relations between water power and navigation and the economic relations between water power and steam power; with international exchange of electric energy; with the use of electricity in agriculture; and with railroad electrification. A meeting in London in 1928 was devoted exclusively to fuel problems; such as cleaning, drying, briquetting and storage of solid fuels; composition, classification, preparation, storage and handling of liquid fuels, high and low temperature carbonization; and the utilization of solid and liquid fuels, gas and electricity for domestic purposes and in industry. A third European "sectional" meeting, confined wholly to water power, has just ended its sessions in Barcelona. A fourth "sectional" meeting will be held in Tokyo in October of this year in connection with the sessions in that City of the World Engineering Congress.

Countries Represented

The Constitution of the World Power Conference provides that it shall be constituted of the National Committees of the several participating countries and that the management of its affairs shall be vested in an International Executive Council, which shall act as the instrumentality for carrying into effect the policies initiated by the respective National Committees. Each participating country has one vote in the International Executive Council.

The following forty-six countries are now represented on the Council:

Australian Commonwealth
Austria
Belgium
Brazil
British Guiana

Bulgaria
Ceylon
Chile
China
Colombia
Czechoslovakia
Dominion of Canada
Denmark
Dutch East India
Esthonia
Finland
France
Germany
Gold Coast
Great Britain
Greece
Holland
Hungary
Indian Empire
Ireland
Italy
Japan
Jugoslavia
Kenya Colony
Latvia
Lithuania
Luxembourg
Mexico
Dominion of New Zealand
Norway
Nyasaland
Peru
Poland
Roumania
Russia
Southern Rhodesia
Spain
Sweden
Switzerland
Union of South Africa
United States of America

The American Section is made up of representatives of five groups. These groups are: (A) The leading national technical societies, such as American Society of Mechanical Engineers, American Institute of Electrical Engineers, etc.; (B) National industrial organizations, such as National Electric Light Association, American Gas Association, etc.; (C) Government departments and bureaus; (D) A group of individual members; and (E) A group of contributing members. The representatives of each organization in the first three groups, and a fixed number of elected members from the last two groups, constitute the Council of the American Committee.

The officers of the Council are a Chairman, Vice-Chairman and a Treasurer, elected every two years. Twelve Council members in addition to the officers constitute a "Board," which serves as the executive agency of the Council and of the Committee. Each of the groups above named will have three members on the Board. The present officers are: Mr. O. C. Merrill, Chairman, Mr. Henry J. Pierce, Vice-Chairman and Mr. H. M. Addinsell, Treasurer. The present Board members are as follows: from Group A, Mr. Calvin W. Rice, representing the American Society of Mechanical Engineers, Mr. George A. Orrok, representing the American Institute of Consulting Engineers, and Mr. Henry J. Pierce, representing the American Electro-Chemical Society; from Group B, Mr. Paul S. Clapp, representing the National Electric Light Association and Major Alexander Forward, representing the American Gas Association; from Group C, Dr. George Otis Smith, representing the U. S. Geological Survey, Mr. Scott Turner, representing the U. S. Bureau of Mines and Mr. O. C. Merrill, representing the Federal Power Commission; and from Group D, Mr. H. M. Addinsell of Harris, Forbes & Company and Colonel Hugh L. Cooper, Consulting Engineer. Appointments have not yet been made from Group E.

The increased participation of the United States on a broad basis in international affairs; the increased investment interests of this country in foreign electrical development; the extent to which the products of the American electrical manufacturers are entering into foreign trade; the growing complexity of foreign international organizations dealing with electrical matters; and the desirability of establishing a greater degree of cooperation in international economical relations all afford a field of unique service for a permanent organization such as the American Section of the World Power Conference.

The information which this organization can secure for its members and the opportunity which it affords to maintain contacts in the international interests of the industry, should be an inducement for all individuals and organizations affiliated with the National Electric Light Association to apply for membership in the American Section, in either Group D or E. Full information about membership and copies of the Constitution and By-Laws can be had on application to the Chairman, Edmonds Building, 917 Fifteenth Street, N. W., Washington, D. C.

Utilities Advertising Association Meeting

ABOUT seventy-five delegates attended the annual meeting of the Public Utilities Advertising Association, held in the Palmer House, Chicago, Ill., on May 14, in conjunction with the American convention of the International Advertising Association.

William H. Hodge of the Byllesby Engineering & Management Corp., Chicago, presided at the morning session, and H. M. Lytle of the Chicago Rapid Transit Co., presided at the afternoon session.

The address of welcome to the delegates was given by Samuel Insull, Jr., president of the Midland Utilities Investment Co., Chicago, Ill. Mr. Insull complimented the advertising men on their honest advertising effort, and said that the utility companies would benefit greatly from it.

J. C. Barnes of the New Orleans Public Service, Inc., and president of the P. U. A. A., then gave his President's address.

Following the reports of the treasurer, by Charles W. Person, the Koppers Company, Pittsburgh, Pa., and of the secretary, T. P. Pfeiffer, Byllesby Engineering & Management Corp., Chicago, Ill., these papers were presented: "Electrical Advertising—Yesterday and Today," by T. J. McManis, assistant manager, publicity department, General Electric Co., Schenectady, N. Y. "The Truth About Electrical Utility Advertising Expenditures," by William H. Hodge, vice-president, Byllesby Engineering & Management Corp., Chicago, Ill. "Selling Transportation with Advertising," by H. O. Crews, supervisor of publicity, Chicago Surface Lines, Chicago, Ill. "Outdoor Advertising for Gas Companies," by John F. Weedon of The Peoples Gas Light & Coke Co., Chicago, Ill.

The afternoon session opened with two papers on cooperative advertising. R. Bourke, manager, Electric Association of Chicago, discussed cooperative advertising in Chicago, and L. D. Gibbs, assistant head, public relations department, The Edison Electric Illuminating Co. of Boston, described a similar activity in his city.

Following reports of various committees, there was a discussion of "The Most Outstanding Developments of the Year in My Company's Advertising." L. K. Starr of the Georgia Power Co., Atlanta, Ga., told of a special street railway campaign, and Henry Obermeyer of the Consolidated Gas Co. of New York, talked on direct mail advertising for gas companies. L. F. Reigel, general sales manager, Virginia Electric & Power Co., Richmond, Va., explained the Stone & Webster monthly advertising contest and how it affects and stimulates the character of the operating company's advertising.

The last item on the program was an address entitled "Where Do We Go from Here?" by F. E. Eriksen, advertising manager, the Milwaukee Electric Railway & Light Co., Milwaukee, Wis.

The following officers were elected:

President, Louis D. Gibbs, the Edison Electric Illuminating Co., Boston, Mass.

First vice-president, Dana H. Howard, Commonwealth Edison Co., Chicago, Ill.

Second vice-president, Irving M. Tuteur, McJunkin Advertising Co., Chicago, Ill.

Third vice-president, R. S. McCarty, Philadelphia Co., Pittsburgh, Pa.

Secretary, R. E. Haas, Columbia Gas & Electric Co., New York, N. Y.

Treasurer, Howard F. Weeks, American Gas Association, New York, N. Y.

Camp "Co-op" Planned for August

CAMP COOPERATION IX, the the eighth annual conference of local electrical leagues will be held at Association Island, Henderson Harbor, N. Y., from Aug. 2 to 6, inclusive.

Held under the joint auspices of the Society for Electrical Development and the League Council, Camp Cooperation is used by local league managers as an opportunity to review and project business plans and principles essential to the furtherance of promotional and educational activities.

As in the past, invitations will be extended to league officials and representatives of central stations, manufacturing and other electrical concerns interested in promoting the market by cooperative means.

EMPLOYEE EDUCATION

Graduation Exercises of Light and Power Company Employees

Brooklyn Edison Company

TWO thousand employees of the Brooklyn Edison Company received certificates, diplomas and other awards the evening of June 25 in the auditorium of Erasmus Hall High School, Brooklyn, as the Educational Bureau of the Company brought to a close its most successful season.

Matthew S. Sloan, president of the company, and the only speaker of the evening, congratulated the employees and discussed the value of educational work to the employees taking advantage of it, to the company, and to the community.

After his address Mr. Sloan made the following awards: 2,272 certificates for the successful completion of single courses in the Edison School; 66 diplomas for the completion of five specified courses; and 18 prizes ranging from $100 to $10 for the best suggestions for improvement of the company's methods received during 1928. Forty-one per cent of the employees were enrolled in one or more courses this year, half that number receiving certificates, marking a substantial increase over 1927.

New Orleans Public Service

A GRADUATION which combined the festive air of a family party took place on June 21 in New Orleans, when the New Orleans Public Service graduated from its evening school more than 300 employee-students.

The graduates ranged from young men in their teens, who have been with the company a year or so, to gray-haired employees, whose service has extended for more than 40 years. The audience, occupying every seat and all standing room, included not only parents of the graduates, but in many instances wives and grown children.

The courses from which the students were graduated are all practical subjects and are offered to all employees. They range from Shop Arithmetic and Slide Rule to Utility Accounting and Practical Electricity, including several N. E. L. A. courses, and many dealing with specific needs encountered in the work of the company.

The class rooms comprise most of the eighth floor of the Public Service Building and are equipped with all necessary class room paraphernalia. The enrollment for the current session totaled 1219, or about one-third of the white employees of the company.—*H. M. Blain.*

New York Edison Company

GRADUATION exercises of the company schools conducted under the auspices of the Educational Committee of the Employees Association of The New York Edison Company, were held the night of June 18 in the auditorium of the Engineering Societies' Building, 29 West 39th Street, New York.

Nineteen prizes and 1,070 certificates of graduation were presented to 951 employees of gas and electric companies serving Manhattan, Bronx, Queens and Westchester county. The 951 graduates exceed by more than 100 the number receiving certificates a year ago. The principal courses of the company schools are technical, commercial and accounting, and this year the enrollment totaled 2,617. The schools are conducted for the benefit of ambitious employees, to enable them to fit themselves for promotion. The principal address was delivered by John W. Lieb, senior vice-president, New York Edison Company, who also presented the prizes.

CORRESPONDENCE

TO THE EDITOR:

For years the electric industry has sought the riddle of "what is electricity?" The answer is simple and has been generally overlooked. Will you do me the honor to publish the enclosed hypothesis?

1. All subdivisions of matter are relative and this is matter relativity.
2. Matter is divided into large bodies (planets), ordinary bodies, molecules, atoms, electrons, magnetrons (speculative), and so on, ad infinitum.
3. The science and study of large bodies in motion is astronomy, of ordinary bodies in motion is mechanics, of molecules in motion is physics, of atoms in motion is chemistry, of electrons in motion is electricity, and of magnetrons in motion is magnetism.
4. Small particles of matter moving rapidly through space produce the effect known as waves. These waves vary in length from extremely short to extremely long ones.
5. Unlocking matter appears as radiated energy of various wave lengths.
6. A wave is the sensory impression of the rapid movements through space of particles of matter, electrons for instance.
7. An electron is a subdivision of matter.
8. The electron is not electricity.
9. Electricity is not matter.
10. Electricity is the science and study of the movements and action of electrons in matter.
11. This whole problem is a question of matter relativity and the movement of unlocked particles of matter through space, giving rise to what we call waves. The wave is not the particle, neither is the particle the wave. A wave is not a thing, but the sensory impression of the movement of various sized particles of matter through space at various speeds.

C. L. KASSON,
3 Duke St.,
Mattapan, Mass.

TO THE EDITOR:

IN reading the article by "Amplifier" in the May issue of the N. E. L. A. BULLETIN, in which he states that the history of the electrical industry could be obtained and written (although a Herculean task) from the proceedings of the past conventions of the industry, the idea occurred to me that it would possibly be one of the best methods in which to acquaint or teach the public with the work the industry has already done and the work that they hope to accomplish in the future to write and publish such a history in some of the popular magazines of today. For example *The Saturday Evening Post, Red Book, American Magazine* and others.

The electrical magazines do not reach enough general readers for such a history or biography to provide much benefit to the public.

PAUL M. JOHANCEN,
Operator Swb.
Southern California Edison Co.,
Visalia, Cal.

WHAT OCCURRED LAST MONTH

Appliances

The case of the Merchant & Evans Company against the Philadelphia Electric Company, in which the plaintiff sought to prevent the defendant from selling appliances, particularly electric refrigerators, in connection with its utility business, on the ground that such sale was not within the corporate grant of the Philadelphia Electric Company was decided on June 7 in favor of the Philadelphia Electric Company by a Pennsylvania court.

* * *

Colorado River Project

On June 25 President Hoover signed a proclamation declaring that the states of California, Nevada, New Mexico, Utah and Wyoming have ratified the Colorado River Compact on a six-state basis within the six months' period required by the Swing-Johnson Bill, that the State of California has met the special requirements of that bill and that, as all the prescribed conditions have been fulfilled, the Swing-Johnson Bill is effective.

The terms of the Swing-Johnson Bill allowed six months for ratification of the Colorado compact by all seven of the Colorado Basin states, but provided that a six-state ratification should be sufficient after the passage of six months. As Arizona has not ratified the compact, it was necessary for the six months' period to pass before the bill could be effective with the compact ratified by only six states.

* * *

According to a dispatch in the New York *World,* Secretary of the Interior Wilbur announced in Las Vegas, Nev., that in making arrangements for development of the Colorado River he would first ask for bids on power development and, if satisfactory bids are not made, would proceed under the government development plan.

* * *

An Associated Press dispatch from Los Angeles, June 26, quotes Dr. Elwood Mead, Commissioner of Reclamation, as announcing that the Southern California Edison Company had offered to purchase a maximum amount of electrical energy to be generated at Boulder Dam.

* * *

On June 17 applications for preliminary power permits for a $200,000,000 project, including thirteen dams on the Colorado River between the Arizona-Nevada and Arizona-Utah borders, were filed with the Federal Power Commissions, by F. T. Colter, president of the Arizona Highline Reclamation Association, according to a dispatch from Phœnic, Ariz. Mr. Colter stated that the thirteen dams proposed would develop an aggregate of 5,000,000 hp., and would be located above the proposed Boulder Dam.

* * *

Consolidations

A recent announcement tells of the organization of the Commonwealth & Southern Corporation, which is to have a large interest in the common stock of the Commonwealth Power Corporation, the Southeastern Power & Light Company and the Penn Ohio Edison Company.

* * *

The Empire Public Service Company of Chicago has acquired the North Baltimore Service Company, the Rudolph Light & Power Company and the Wooster Electric Company, all of Ohio. It has also acquired the Toledo, Bowling Green & Southern Traction Company of Ohio.

* * *

The American Water Works & Electric Company of New York has gained a controlling interest in the Loudoun Light & Power Company of Purcellville, Va.

* * *

The United Gas Improvement Company announces purchase of a majority of the capital stock of the Erie County, Pa., Electric Company.

* * *

The Mountain States Power Company has purchased the Lander, Wyo., Electric Light & Power Company.

* * *

On June 18 announcement was made by J. P. Morgan & Company of the formation of the Niagara-Hudson Power Corporation, a holding company which will have interests in the Buffalo, Niagara & Eastern Power Corporation, Northeastern Power Corporation and Mohawk-Hudson Power Corporation. Offers are to be made to holders of common stock of these companies to exchange their securities for securities in the new corporation.

* * *

The New England Public Service Company has acquired the properties of the Lisbon, N. H., Light & Power Company and the Bethlehem, N. H., Electric Company.

* * *

The Pacific Gas & Electric Company of San Francisco is purchasing the properties of the Yuba River Power Company.

* * *

Announcement has been made of the formation of Inland Utilities, Inc., which will combine properties in Pennsylvania, West Virginia, Maryland and Virginia.

* * *

Earnings of Utilities

The Department of Commerce announces that gross earnings of public utility enterprises in April, exclusive of telephone and telegraph companies, as reported by 95 companies or systems operating gas, electric light, heat, power, traction and water service, were $190,000,000 as compared with $195,000,000 in March, and $181,143,683 in April, 1928.

* * *

Federal Trade Commission's Investigation

On June 4 the United States Senate adopted a resolution directing that the Attorney-General be furnished copies of the report of the Federal Trade Commission's investigation into newspaper ownership by power companies, together with the report of the Postmaster-General to the Senate on the ownership of the same newspapers "for such action as may be appropriate by the Department of Justice."

* * *

On June 5 Senator Phipps of Colorado, Chairman of the Post Office Committee of the Senate, introduced a bill to amend the present law governing newspapers' reports of ownership and circulation by providing that the Post Office Department, in addition to the names of stockholders, bondholders, or other security holders, may demand any additional information of the financial makeup of the newspaper which it may desire.

* * *

On June 12, at a session of the Federal Trade Commission, a statement by A. R. Graustein, president of the International Paper & Power Company, that his company had not given financial assistance to its subsidiary, the International Paper Company, in the latter's investments in thirteen newspapers, was entered in the record. A statement from the N. E. L. A. concerning payments made to educators for work in co-operation with the Association was also presented. A letter from C. G. Abbot, Director of the Smithsonian Institution, declaring that only 13 of the 1147 publications of the Smithsonian during the past ten years had been paid for by "outside parties," was also presented.

* * *

On June 13 witnesses before the Commission were Col. Ira C. Copley, former member of Congress and owner of a group of newspapers in California and Illinois, and W. J. Sylvester of Chicago, secretary and organizer of the Industrial Conservation Board, Inc. Mr. Copley, who appeared at his own request, asserted that he had no securities whatever in public utilities, and that there is not a dollar of the utilities' money invested in his newspapers.

Mr. Sylvester gave an outline of a program of activities to discourage government competition with private enterprise which has been contemplated by his organization. He declared that contributions for his organization had been received from some utilities.

* * *

On June 14 Josiah T. Newcomb, counsel of the Joint Committee of National Utility Associations, was examined by the Commission. He identified a number of memoranda and letters dealing with Boulder Dam, Muscle Shoals, the Walsh Resolution and other matters.

* * *

On June 14 a telegram from Paul S. Clapp, Managing Director of the National Electric Light Association, correcting an erroneous impression as to payments to educators by the N. E. L. A., left by the statement introduced on June 12, was presented.

* * *

On June 15 the Commission sent its Fifteenth Monthly Interim report on the inquiry to the Senate. This lists witnesses heard since the last report and mentions the progress of accounting work being done in the offices of certain holding companies and operating subsidiaries.

* * *

On June 19 the following witnesses were examined by the Commission: Thomas W. Martin, Birmingham, president of the Southeastern Power & Light Company and of the Alabama Power Company; Logan Martin, Birmingham, general attorney for those companies; Joseph F. McGowin, Mobile, financier; Ernest F. Ladd, president of the Merchants National Bank of Mobile; R. B. Chandler, editor of the *Mobile Press;* Victor H. Hanson, publisher of the *Birmingham News* and the *Birmingham Age-Herald;* and Abner Aldridge of Birmingham, president of two coal companies which are subsidiaries of the Southeastern Power & Light Company. Testimony concerned the financing of the *Mobile Press,* which began publication last April. Witnesses declared that no public utility money was invested in the paper, although loans, since repaid, of individuals interested in utilities, were made to Mr. Chandler.

On June 27, the Federal Trade Commission announced that it had adjourned hearings in its public utilities inquiry until September. A statement by the Commission announces that the hearings will be resumed after September 10, when rebuttal testimony will be introduced by representatives of the utilities. The statement says that the publicity and propaganda phase of the inquiry has not been completed. Work by the Commission's staff on material to be introduced in both publicity and financial phases of the investigation will be continued during the summer, the statement says.

* * *

Financial

According to a statistical survey issued by Stone & Webster and Blodget, Inc., new public issues of securities during the past six years totaled $45,803,000,000, of which $11,424,000,000 were securities of public utilities.

* * *

Hydro-Electric

On June 7, O. C. Merrill, Executive Secretary of the Federal Power Commission, submitted his resignation, to take effect July 1. He is to become head of the reorganized American section of the World Power Conference.

* * *

The Federal Power Commission holds that it has jurisdiction over the proposed water-power development at Cumberland Falls, according to an announcement made by its chairman, Secretary Good, on June 15, which tells of a decision of the Commission made at its June 14 meeting. The statement of the Commission includes an opinion rendered by its chief counsel, in which it is held that it is not within the power of the Commission to refuse a license to the Cumberland Hydro-Electric Company for construction of a water-power development at Cumberland Falls because of protests on the grounds of alleged prospective injury to the scenic features of the falls.

* * *

On June 17, the Federal Power Commission issued a statement on various cases involving authorization for permits to develop power, one project for which a preliminary permit was recommended is a proposed installation of 79,000 hp. on the South Platte River, by the city and county of Denver, Colo. Another recommendation is for a preliminary permit to the Virginia-Carolina Power Company for projects on the Roanoke River between Weldon, N. C., and Buggs Island, Va.

* * *

Dexter L. Cooper, Inc., has applied to the Federal Power Commission for a license covering the proposed tidal power development at Passamaquoddy Bay, Me. The plant calls for immediate installation of 464,000 hp. and ultimate installation of 1,000,087.

* * *

A party of English explorers, supported by the Royal Geographic Society and assisted by the Government of Newfoundland, arrived recently in New York City, after having completed almost a year of exploration and adventure in the wilderness of Labrador. They report enormous potential riches in timber and water power. The water power is said to be in a nest of great waterfalls, of which there are certainly four and possibly five.

* * *

Governor Young of California has signed a bill giving the State engineer power to supervise the design, construction and maintenance of all storage dams over 15 ft. in height. An appropriation of $200,000 is provided in the bill to make a study of more than 500 dams now in use in California. If any of these are found to be faulty, the State engineer is empowered to make such changes as will insure their safety. This bill was a result of the St. Francis Dam disaster.

* * *

On June 9, Secretary Wilbur announced the power and reservoir possibilities of the south and middle forks of the Salmon River, Idaho, will be surveyed by a party of engineers from the Geological Survey this summer.

* * *

The Washington Electric Company has applied to the Federal Power Commission for a license to construct two dams across the Columbia River at Rock Island by means of which 200,000 hp. of electrical energy would ultimately be developed, with an initial installation of 80,000.

* * *

Investors in Utilities

According to the annual public utilities survey made by Bonbright & Company, more than 3,000,000 investors have placed nearly $25,500,000,000 in the public utility business of the country, exclusive of steam railways. Of this about $10,300,000,000 is in the electric light and power industry.

* * *

Rates

On June 3, an agreement was filed in the Federal District Court in Boston under which the suit of the Worcester Electric Light Company against the Massachusetts Department of Public Utilities was withdrawn. The company had protested the order of the department for a five-cent initial rate. The company itself had instituted voluntarily a six-cent initial rate.

* * *

The New Bedford, Mass., *Standard*

says that a cut in the rates charged the city for electric current is announced.

* * *

The San Diego, Cal., Consolidated Gas and Electric Company recently placed in operation a new basic rate for residential and domestic electric service, which will bring three-cent electricity within the reach of the average user. The new rate is expected to increase the average residential demand through the use of additional electric appliances. Reductions are also made to high load factor power users, as well as in street lighting, commercial lighting and city power and light.

* * *

A new schedule of reduced electric power rates for large industrial and oil field power users has become effective in the Wyoming division of the Mountain States Power Company.

* * *

On June 4 the Nebraska Power Company announced in the Omaha papers that its new lower rates were in effect. The initial rate for domestic use is now 5½ cents.

* * *

The Hydro-Electric Power Commission of Ontario announces that 243 municipalities are to receive reductions in rates on current furnished by the Hydro.

* * *

On June 11 the California State Railroad Commission held hearings on rates of certain California utility companies, three gas and three telephone companies being represented. A number of other companies are to be heard from later.

* * *

Regulation

On May 28 the Massachusetts Senate passed the bill already passed by the House, which would permit municipalities to enter the electric business without first purchasing privately owned systems now serving them. This is the bill sponsored by the Massachusetts Department of Public Utilities as part of their campaign to influence utility companies to enter into contractual relations with the State for regulation of rates. Before passing the bill the Senate made four amendments. These have been rejected by the House, which appointed a conference committee to negotiate with the Senate.

* * *

During its recent session the Michigan Legislature passed, and the Governor of Michigan signed, a bill to encourage the construction of water-power projects, one provision of which is to the effect that, after 75 per cent of lands necessary for a water-power project have been purchased, condemnation proceedings may be started against owners of the remaining. Another bill which became law confers upon the State Conservation Commission authority to provide for the erection and maintenance of proper means for the free passage of fish through or over dams. Another bill provides for the creation of metropolitan districts embracing two or more cities, villages or townships, or combinations or parts of the same, for the purpose of acquiring, owning and operating parks or public utilities for supplying sewage disposal, drainage, water or transportation. The bill as originally drawn also included light and power, but this feature was afterward stricken out. Governor Green in signing the bill objected to striking out the provision concerning light and power.

* * *

On June 4 Governor Moody of Texas, addressing a new special session of the Legislature, advocated enactment of a law for regulation of public utilities in Texas.

* * *

Before adjourning June 9, the Massachusetts Legislature adopted a resolution creating a commission of seven members to investigate the activities of the utilities in Massachusetts. The legislature also passed the bill sponsored by the Massachusetts Department of Public Utilities, but in amended form, permitting municipalities to engage in the utility business without first purchasing the privately owned systems serving them. The Governor has signed the resolution and the bill.

* * *

The Wisconsin House has passed several bills affecting the utilities sponsored by the State League of Municipalities. One authorizes submission to the voters of a constitutional amendment permitting the State to go into the electric business. Another permits municipalities in rural districts to combine for the purpose of generating and distributing electricity. Another proposes a change in the constitution to remove from the existing debt-limitation any indebtedness created for the purpose of acquiring or constructing a municipal utility. The bills go to the Wisconsin Senate.

* * *

The President of the Massachusetts Senate and the Speaker of the House have announced appointment of the four members of the commission which is to investigate utilities in Massachusetts. The other three members are to be appointed by Governor Allen.

* * *

On June 19 six Republican Senators and Representatives in the New York Legislature were appointed as the Legislature's representatives on the special commission to investigate utility regulation in New York State. Governor Roosevelt is still to appoint three members of the commission.

* * *

On June 27, Governor Roosevelt of New York announced that he had appointed Frank P. Walsh and Professor James C. Bonbright of New York City, and David C. Adie of Buffalo, as members of the Commission to investigate utility regulation in New York State. These, with the six Republican Senators and Representatives already appointed, complete the personnel of the Commission.

Behind the Veil

(*Continued from page* 423)

den jar) may be charged, and from electric fire thus obtained spirits may be kindled, and all the other electric experiments be performed which are usually done by the help of a rubber, glass globe or tube, and thereby the sameness of the electric matter with that of lightning completely demonstrated."

Franklin made many notable observations, experiments and discoveries which have been amply reviewed in the celebrated work on electricity by Dr. Priestly. One of the most interesting has to do with the failure of European electricians in firing gun powder by the electric spark. Explaining his own method in his "Letters and Papers," he says that he sent a charge of electricity "through a small glass tube that had borne it well when empty, but when filled with water was shattered to pieces and driven all about the room. Finding no part of the water on the table, I suspected it to have been reduced to vapor. I was confirmed in that suspicion afterward when I had filled a like piece of the tube with ink and laid it on a sheet of paper, whereon after the explosion I could find neither any moisture nor any sully from the ink. This experiment of the explosion of water, which I believe was first made by that most ingenious electrician, Father Beccaria, may account for what we sometimes see in a tree struck by lightning, when part of it is reduced to fine splinters like a broom; the sap vessels being so many tubes containing a watery fluid, which, when reduced to vapor, sends every tube lengthways. And perhaps it is this rarefaction of the fluids in animal bodies killed by lightning or electricity that by separating its fibers renders the flesh so tender and apt so much sooner to putrefy. I think, too, that much of the damage done by lightning to stone and brick walls may sometimes be owing to the explosion of water found, during showers, running or lodging in the joints of small cavities or cracks that happen to be in the walls."

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Comparative Use of Electricity in Great Cities

INTERESTING comparisons of the use of electricity in the great cities of Europe with those of the United States have recently been made public by Dr. Adolph, general manager of the Berlin, Germany, City Electric Company.

While many of the European cities show a high proportion of wired homes, the average amount of electricity used *per consumer* is usually far below the figure commonly met with in the United States. In addition to this, the increased electrification of industry in this country shows a total use, when reduced to per capita figures, much in excess of anything found abroad. The proportion of wired homes in various cities in 1927 is given by Dr. Adolph as follows:

	Per Cent
Basle, Switzerland	100.0
The Hague, Holland	100.0
Zurich, Switzerland	99.3
Amsterdam, Holland	96.0
Copenhagen, Denmark	89.8
Stockholm, Sweden	88.8
Stuttgart, Germany	82.4
Paris, France	63.8
Budapest, Hungary	56.6
Berlin, Germany, about	50.0
* * * * *	
Chicago	96.3

The total annual sales of current for all purposes in these cities, when divided by the population, gives a good illustration of the extent of electrified industry and the degree to which the inhabitants are making use of electricity. As given by Dr. Adolph, the per capita sales of energy in various cities in 1927 was:

	Kilowatt hours per capita
Basle, Switzerland	640
Zurich, Switzerland	604
Stockholm, Sweden	295
Paris, France	279
Stuttgart, Germany	258
Berlin, Germany	252
Amsterdam. Holland	236
Vienna, Austria	210
The Hague, Holland	209
Hamburg, Germany	209
Copenhagen, Denmark	195
London, England	151
Budapest, Hungary	135
* * * * *	
Chicago	1088
Philadelphia	914
Detroit	884
New York	667

The American Home

IN the course of an address on "The American Home in Citizenship Training" delivered before the convention of the National Congress of Parents and Teachers, the Hon. Ray Lyman Wilbur, Secretary of the Interior, said:

"Labor-saving devices in the home, easily accessible automobiles in the garage, and good highways have to some degree made the home a distributing center for its members rather than an assembling point. Fortunately automobiles are large enough so that most of our families can go together in one. Fortunately, too, there is less drudgery for the mother, so she can be an active citizen herself and can if she chooses have more time for her children."

This might have been written by someone in the merchandising department of a light and power company endeavoring to explain the social advantages of electrical appliances for eliminating the drudgery of housekeeping.

Electric Altimeter New Safety Factor for Airplanes

ACCORDING to *Telegraph and Telephone Age*, Dr. E. F. W. Alexanderson has recently invented an altimeter for airplanes, using the familiar red, green, and yellow lights of ground traffic, and which shows the aviator exactly his height from the earth regardless of whether he can see land or not. It has already been satisfactorily tested and gives promise of making flying safe in rain, fog or at night. The device is based on the theory that the time interval required for a radio impulse to travel from a plane to the ground and back again to a receiving set on the plane might be practically adapted as a reliable altitude indicator.

The visual recording instrument is small and may be mounted on the cockpit panel in full view of the pilot. It consists of a motor on which ground distance up to 3000 feet or down to within 50 feet of the earth may be instantly recorded. In his experiments Dr. Alexanderson used an oscillating receiver, one of the type which sends out a wave which may be picked up on other receivers as a squealing note or beat. The echo or reflected signal was picked up on the same receiver which sent out the wave. He discovered that every time the airplane changed altitude by half a wave length a whistling note went through a complete tone cycle, from low pitch to a high pitch and back again to a low pitch. By counting the cycles of the tone it was possible to measure the altitude, the measuring stick being one-half the wave length of the antenna oscillator.

All-Electric Garage

A TWENTY-FIVE story garage, said to be the only one in existence which employs electric power for all automobile handling within the building, has recently been completed on East Forty-fourth Street, New York City.

There are six receiving spaces served by three elevators carrying two cars each. Each elevator platform is equipped with two electric parkers which tow the cars onto the elevators from the receiving spaces and take them off the elevators into their spaces on the storage floors.

The parker is a very low towing unit which runs beneath the car and engages with the rear axle housing by means of an adjustable coupler. It is controlled by the elevator operator.

The garage has an installation of 150 kilowatts for lighting and 800 horsepower for the operation of pumps, washers, elevators, door openers and parking motors.

THE BOSS OF THE STREET LIGHTS

In a little North Carolina town there is a Superintendent of Public Works whose duties cover, among other things, the operation with his own hands, unaided, of the electric light system, water works system, volunteer fire department, maintenance and repair, meter reading, replacing blown fuse plugs when some good housewife's flatiron acts up, and so forth.

Needless to say, our unsung hero has no great amount of time to devote to the study of either the Einstein theory or the fourth dimension and, in fact, has trouble enough in being on hand to turn on and off the lights at just the right time to suit all concerned. To the possessor of such talents and ingenuity as one must possess to fill his post successfully this did not present an insuperable problem. In his back yard is a hefty rooster of staid and dependable habits whose belief in the "early to bed and early to rise" habit is unshakable.

Here, then, are the problems and the elements of their solution:

A special perch was arranged for friend rooster pivoted at one end and so arranged that his weight would depress the perch a few inches to pull down on a cord to close the street lighting circuit regularly at dusk and to open it when old reliable leaves his perch at break of day.

To the best of my knowledge there is no device on the market today capable of taking cognizance of the early dusk on a rainy day or late darkness on a clear day or of the variable hours of dawn with the changing weather as does this old rooster.

—*L. H. Hardin, in Electrical World.*

THE REVIEWING STAND

Operating Code Manual

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-58, 28pp. Price, 40 cents; to members, 25 cents.

THIS Operating Code Manual presents in a convenient form all of the previous reports of the Subcommittee, outlining rules of operating procedure in both boiler and turbine rooms of steam-generating plants. As it is impossible to formulate one set of rules to fit all cases, this Manual makes no attempt to stress adherence to the sequence of the different operations, it being understood that modifications are necessary, depending upon the best judgment of the particular problems and upon the installed equipment in each individual plant.

The value of this Manual is not measured by the exactness with which the rules embodied are carried out, but rests, rather, upon the fact that these rules in their general make-up include all possible necessary phases of any particular operation.

The Manual is divided into two sections: the boiler plant and the prime mover plant. Under general operation of the boiler plant, the following subjects are covered: Boilers, coal-handling equipment, pulverized fuel, auxiliaries, fans, boiler feed pumps, feed water heaters and evaporators. The routine care and maintenance of boilers, boiler auxiliaries and instruments also is covered in the first section.

The general operation under Section 2—prime mover plant—covers turbines, reciprocating engines and auxiliaries. The routine care and maintenance of turbines and auxiliaries concludes the Manual.—*E. S. B.*

Types of Distribution Systems, and Methods of Effecting Changeover

Serial report, Overhead Systems Committee, Engineering National Section, N. E. L. A Publication No. 289-46, 28pp., 20 illustrations. Price, 40 cents; to members, 25 cents.

IN this report the study of distribution practices is restricted to the subject of the design of the individual feeder layout for one general type of system, namely, the 4000-volt, three-phase, four-wire system. In presenting this report the Committee believes that a general analysis of the various types of feeder layout and the advantages and disadvantages of the various classifications, particularly as to where their application is economical, will be of value. The application of the various types to actual systems is also discussed.

In the second part of this report various methods of changing over to 4000-volt, three-phase, four-wire system from two-phase and three-phase, 2300-volt systems are discussed. As the data in a previous report (Publication No. 267-15) indicated that a number of companies were considering such a changeover, this collection of data regarding the experience and methods followed by other companies effecting similar changes is pertinent. The report is based on a survey of ninety-five companies. Studies were made of the distribution systems of forty-eight of these companies operating a 4000-volt Star System.

Operating circuit maps are given, which illustrate in detail the important features of several typical circuits. These maps as reproduced in the report illustrate in a comparable manner the application of the various types of systems.—*E. S. B.*

Boiler and Turbine Room Instruments

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-59, 32pp., 37 illustrations, 3 tables. Price, 50 cents; to members, 35 cents.

BOILER and turbine room instruments as now offered by the various manufacturers show marked improvement in accuracy, reliability and decreased maintenance according to the findings of the Committee, which has studied this subject. In this report the Committee states there is still room for further progress in these directions, particularly as to flow meters and instruments for the measurement of the temperature of water, gases and steam where weighted averages are so necessary for obtaining true efficiencies.

Results are noted in this study that with the increasing size of boiler units, as well as generating units, the cost of an instrument installation has become a very small percentage of the total cost of the equipment. Consequently there has been a tendency toward the use of extremely elaborate instrument installations. In view of this fact, the report repeats a previous warning to the effect that the Committee believes it better to install too few instruments than to install more than can be taken care of by the operating organization.

The report is based chiefly on the statements of member companies and manufacturers, and is profusely illustrated. A bibliography is included.—*E. S. B.*

Training for Better Public Contact —Analysis of Public Contact Work

Serial report, Industrial Relations Committee, Public Relations National Section, N. E. L. A. Publication No. 289-44, 12pp. Price, 15 cents; to members, 10 cents.

THIS is the second report of a series of four being prepared by the Industrial Relation Committee's Public Contact Training Subcommittee on this all-important subject. This report outlines a method of analysis of public-contact work which brings to light the nature and range of contacts, and arranges this information in a suitable form to be used as the basis for the preparation of a training program.

This report deals only with an analysis of the work. The subject of suitable training methods is to be discussed in the third report of this series.

Inasmuch as there are very few departments in an electric utility which do not have at least some contact with the public, the subject being covered in this series of reports is one of real importance to all member companies.—*E. S. B.*

Public Speaking Committee

Serial report, Public Speaking Committee, Public Relations National Section, N. E. L. A. Publication No. 289-77, 12pp., 1 table, 2 illustrations. Price, 25 cents; to members, 15 cents.

THE Public Speaking Committee outlines its work during the past year in this report. In pointing out the importance of public speaking activities, both to the customers and to the employees, this Committee has made it its purpose to encourage these activities not only persistently and continuously, but also to encourage member companies to carry on this work in a systematic, businesslike way.

The report reviews the work of the Committee in developing a statement of its Policies and Plans, which is given in the report. A comparison of Public Speaking activities for 1928 and 1927 by geographic divisions and States is given in tabular form. This comparison shows that a total of 36,887 talks were given to a total audience of 4,629,926, or 5603 talks to 764,456 more people than were reported in the last previous report.—*E. S. B.*

Lamp Committee

Serial report, Lamp Committee, N. E. L. A. Publication No. 289-67 16pp., 8 tables, 13 illustrations. Price, 30 cents; to members, 20 cents.

THIS serial report presents facts and figures and reviews developments in the Incandescent Lamp field during the past year. The informative and interesting detailed information with respect to this important branch of the business is certain to be of interest to all member companies.

In addition to the statistics on lamp sales, average lumens, watts and efficiency of lamps, distribution by voltage. demand by sizes, street series lamps, and price changes, the report discusses lamp developments and the use of lamps of proper voltage. The use of lamps for sound pictures and the development in the usage of submerged or underwater lamps, also are discussed. The report also includes most interesting and favorable comments on the progress of airport lighting. Lighting demonstrations and special exhibits is another subject reviewed by the Committee.

A most interesting part of the report deals with the Fiftieth Anniversary of the Incandescent Lamp, in which the Committee adds to the universal acclaim its tribute of admiration and esteem for Edison, the genius, and for Edison, the man.—*E. S. B.*

Building the Load on the Farm

Serial report of Rural Electric Service Committee, N. E. L. A. Publication No. 289-61, 24 pp., 31 illustrations, 1 table. Price, 40 cents; to members, 25 cents.

IN this report the Rural Electric Service Committee presents evidence that an acceptable load for electric light and power companies exists and can be developed by intelligent effort on the 6,371,640 farms in the United States.

The survey on which this report is based covers almost every State in the Union. Listed in this report are the names and addresses of farmers using 3000 kw-hr. or more per year. A brief summary of the purposes for which the electricity is employed is also given in this list, which is classified according to States. Numerous illustrations picture electricity at work on various classes of farms.

This evidence of how the load is being built on the farm is a valuable contribution to the industry, and should be in the possession of every progressive company.—*E. S. B.*

The Use of Hydro-Electric Units as Synchronous Condensers

Serial report, Hydraulic Power Committee, Engineering National Section, N. E. L. A Publication No. 289-66, 16pp., 5 charts. Price, 15 cents; to members, 10 cents.

THIS serial report, edited from the Convention report of the Hydraulic Power Committee, National Southeastern Section, is a valuable contribution on this subject. The use of hydro-electric units as synchronous condensers is coming to be an accepted practice in the field of hydro-electric development. The Committee states that this practice, like so many other electrical problems, is the direct result of the ever-increasing demand for better voltage, better power factor and for better service conditions. All public utility concerns now recognize the necessity of operating their systems in such a way as to meet this ever-increasing demand.

The general experimental results and economic conclusions of a number of operating companies who have equipped their hydro plants so the units can be used as synchronous condensers is recorded in the report. The questionnaire which formed the basis of study, and which was sent to all southern hydro-electric companies who indicated that they were using their generators as synchronous condensers, is included in the report, along with five tables containing tabulations of the replies to the questionnaire.—*E. S. B.*

Foreign Developments

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-64. 36pp. 29 illustrations; 5 tables. Price 55 cents; to members 35 cents.

THIS Serial Report contains interesting statements by American engineers, among them Messrs. I. E. Moultrop, A. D. Bailey and G. A. Orrok. Several foreign engineers have contributed general statements, including Messrs. F. H. Rosencrants, W. H. Patchell, A. L. Mellanby, J. Mas Nieto and R. H. Andrews. A number of other prominent European engineers have submitted statements covering some detailed engineering developments. Abstracts from foreign journals also are included. The opinions expressed in these statements are quite specific and indicate the general trend of power plant development in foreign countries. —*E. S. B.*

Penstock Valves

Serial report, Hydraulic Power Committee, Engineering National Section, N. E. L. A. publication No. 289-72. 28pp. 19 illustrations. Price 40 cents; to members 25 cents.

A BRIEF review of current practice in the use of valves in penstocks is given in this report of the Hydraulic Power Committee. The investigation of this Committee has been limited to the types of valves which were located in a closed penstock or conduit leading from an open forebay or surge chamber to the hydraulic power units of a water power plant.

The data included in this report were submitted by seven member companies and five manufacturers. The report will be of interest to designers, manufacturers and operating companies as it is a most authoritative presentation of this subject.

The report includes discussion on the following: location of penstock valves; choicee of type of valve; loss of head in valves; use of valves as meters; power required to operate valves; cost; reliability in operation; leakage; emergency operation; operating mechanism, and details of design.—*E. S. B.*

Suggested Specifications for Overhead Line Materials and Methods of Construction for Low and Medium Voltage Lines

Serial Report, Overhead Systems Committee, Engineering National Section, N. E. L. A. Publication No. 289-45. 72 pp. 63 illustrations. Price 90 cents; to members 60 cents.

THIS report of the Overhead Systems Committee covers three years' work and is presented in three parts.

The first deals with the use of recommended practices suggested in 1924. New recommended practices and a review of materials is the subject of part two. Part three gives the methods of construction for low and medium voltage lines. Forty full-page drawings accompany the detailed suggested specifications. Thirteen photographs are reproduced showing typical installations of potheads, filled with either compound or oil in various positions on line arms or buck arms, and eight illustrations show typical transformer platform installations. The report also includes five full-page plates illustrating methods of construction using materials covered by part two of the report.—*E. S. B.*

Mechanical Reliability of Hydro-Electric Units—1927

Serial report, Hydraulic Power Committee, Engineering National Section, N. E. L. A. Publication No. 289-68. 20pp. 6 tables. 3 charts. Price 30 cents; to members 20 cents.

THE HYDRAULIC Power Committee presents in this report the result of its fourth year's study of this subject. In the collection, tabulation and analysis of the data no change has been made from the previous year's procedure. The data in this report are compiled from records contributed from 134 units as compared with 95 in the 1926 report. This indicates the encouraging increase which has been noted by member companies operating eligible units from year to year.

The information is set forth in detail in six tables showing the principal characteristics of hydro-electric units, 1927 data; mechanical reliability of hydro-electric units—1927; summary of operating records, hydro-electric units; analysis of outage hours, 1927 data; average outage time classified by years of installation, and analysis of causes of outage in per cent of total outage time. —*E. S. B.*

Guide to This Issue

SCIENCE AND PROGRESS IN THE INDUSTRIES, 469

John J. Carty

The dependence of industry and civilization upon pure science research.

COUNTRY WIDE ACTIVITY IN NATIONAL FOOD PRESERVATION PROGRAM, 472

An account of the developments of this cooperative activity.

COMPLETE SERVICE, 473

Martin J. Insull

The origin of the Public Relations Section, its work, ideals and accomplishments. Business is now giving the facts to the public in every way it can. The most successful businesses are those which do most to keep the public informed.

A PUBLIC RELATIONS YARDSTICK, 475

Rob Roy MacLeod

The Martin J. Insull prize paper for 1928-1929. Electric service is possible because of five factors: stockholders, management, employees, customers and plant. All are equally important; all have certain responsibilities. A definite plan is necessary to harmonize the efforts of all factors.

HOW TO INCREASE THE USEFULNESS OF THE ACCOUNTANT IN THE PUBLIC UTILITY INDUSTRY, 480

Claron D. Barber

The third H. M. Byllesby prize paper for 1927-1928. The Accountant must be prepared to meet more and more complex problems. He must shift and adapt his systems and methods to meet varying demands of business for information, for control and for analysis.

BEHIND THE VEIL: SCIENCE, DEMOCRACY AND FROGS' LEGS, 483

Ernest Greenwood

The fifth of a series which portrays against a social-historic background this evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

RESOLUTION TO MR. EDISON, 486

Text of Resolution by the National Electric Light Association, and response of Mr. Edison.

CONTEMPLATING RURAL ELECTRIFICATION, 487

Amplifier

What the electric light and power industry has been doing toward the promotion of rural electrification.

THE FUNCTIONS OF BUDGETARY CONTROL IN MODERN ELECTRIC UTILITY MANAGEMENT, 489

A report of the Budget Committee, Accounting National Section, B. S. Rodey, Jr., Chairman. The electric industry is in a position to apply budget principles to the best advantage in maintaining a balance between the ever-expanding functions of the business and in controlling all phases of its operations.

SUBSTATION CONTROL SYSTEMS, 492

G. R. Milne

A report of the Substations Subcommittee of the Electrical Apparatus Committee, Engineering National Section. The design of control systems, the measures taken to insure their integrity, their sources of supply, and the loads and extraneous attachments on the control bus are discussed.

AUTOMOBILE ACCIDENT CLASSIFICATION, 497

A report of the Accident Prevention Committee Subcommittee on automobile accidents, W. E. Sanford, Chairman. Proposal of standard chart for classification of automobile accidents with the view of reduction of traffic hazards by means of analysis of drivers' records.

PAPERS SUBMITTED IN PRIZE AWARDS CONTEST NOW AVAILABLE TO MEMBERS, 499

The association will loan upon application the papers entered in the 1928-1929 prize awards contest.

LIGHTS GOLDEN JUBILEE, 502

General news of Light's Golden Jubilee developments. The Jubilee in foreign countries.

OBITUARY, 504

BILL JONES IDEA, 505

G. I. Vincent

Personalized and immediate service to customers through reorganization of the order executing department, making customer instead of the job the unit.

THE PRESIDENT'S PAGE

Mergers and Combinations

THERE seems to be a badly divided public opinion in respect of the mergers of operating companies and the combinations and groupings of holding companies now going forward in our industry.

Some people assert that the "power trust" is getting the entire country into its grasp, and hold that the only protection for the public is to do something drastic to the monster. Remedial proposals range from increased restrictive regulation to government competition with our industry or absorption of it. Others view larger units and groupings of units of our industry as a logical development, paralleling similar developments in other lines of business. The extreme of these views is set forth by Mr. Ford, who wishes for one country-wide system to produce the ultimate of efficiency, economy and use of product.

It is, perhaps, natural that the events which bring out such diverse views should be arousing comment, for they have come about rapidly and they are fairly sensational in size and scope. The implication, however, that their consequences should be evil is not borne out by results so far ascertained, or by conditions and circumstances in the situation.

Taking them on their lowest basis, power and light companies are concerns in business to make money. They have a very large investment. They can make money, not by limiting their product—electrical service—but by selling it. They can sell it only by making it commend itself to customers as to quality, price, usefulness. Their constant effort then must be to make service better and prices lower so that they may sell more service.

So long as they do this, their size is no detriment to the public interest but rather an aid to growth, development and further usefulness to the public. The situation is simple, logical, with no catch in it. It is the duty of the industry to demonstrate this by results which will speak for themselves.

MSSloan

President.

N·E·L·A· BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service."

M. S. SLOAN, *President*

PAUL S. CLAPP, *Managing Director*

GEORGE F. OXLEY, *Director, Dept. of Public Information*

SAMUEL H. TAYLOR
O. A. WELLER

Subscription price of the N. E. L. A. BULLETIN, in United States, is $3.00 per year to members and non-members. Half price to colleges and libraries. Single copies, 25 cents. Foreign subscriptions, $4.00 per year to non-members.

Orders should be made direct to the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

The closing date for the N. E. L. A. BULLETIN is the fifteenth of the month preceding the month of issue. Material intended for publication must be in the hands of the editor by that date to insure publication the following month.

Manuscripts and correspondence relating to the N. E. L. A. BULLETIN should be addressed to the Editor, N. E. L. A. BULLETIN, 420 Lexington Ave., New York, N. Y.

The National Electric Light Association does not assume responsibility for nor necessarily endorse, or approve, statements made by individual contributors.

Code address of the National Electric Light Association is "Nelap," Bentley's code.

For the convenience of members arriving in New York after office hours or on legal holidays, the following telephone numbers connect with N.E.L.A. headquarters office:

Lexington	3300 3301 3302	Paul S. Clapp A. Jackson Marshall
Lexington	8592	George F. Oxley
Lexington	3310	Fred W. Herbert
Lexington	5059	C. E. Greenwood
Legington	3311	E. H. Greenwood
Lexington	5035	J. O'R. Coleman and Engineering Department
Lexington	3312	Editorial Department

FROM executives down, every man, woman and child in the electric business should have this thought firmly in mind, that he or she has a part in working out a vision so vast that no man can see it entire. As Mr. Edison has said, it is beyond our comprehension, just as the present development was beyond the comprehension of his early days.

Henry Ford.

International Good-Will

WHILE it was to be expected that the United States would respond in a most whole-hearted manner to the celebration of Light's Golden Jubilee, the plans that have been announced for its observance in foreign countries testify in a most agreeable way to the universal regard for Mr. Edison.

All of the countries to participate have themselves made very distinguished contributions to the development of electrical science, and for this reason their participation in the Jubilee celebration is all the more generous and appreciated.

Such international demonstrations are bound to have more than immediate significance, through the provision of excellent material for the culture of world-wide amity.

The electrical industry is fortunately situated to foster the cause of international good-will through the free interchange of experience in technical development, and the cultivation of friendships that develops from the personal contact of the delegates who journey to and from the several countries on missions connected with electrical progress.

The Way the Wind Blows

THE semi-annual supplement to "Government (Political) ownership and Operation and the Electric Light and Power Industry," recently issued by the National Electric Light Association, states that there are 1,440 cities and towns, with a total population of 2,999,615, where municipal operation has disappeared and the communities are now served from company distributing systems.

Of these 1,440 places, 14 are cities of more than 30,000 population, 19 are cities of 10,000 to 30,000 population, 40 are towns from 5,000 to 10,000 population, and 50 are towns from 1,000 to 5,000 population, while the remaining 866 places are hamlets of less than 1,000 inhabitants.

The records also show that 498 municipal systems, serving a present total population of 1,603,864, which at one time operated their own power plants, have sold or junked their generating plants to buy electricity wholesale from the systems of private companies. Of these 498 places, seven are cities of more than 30,000 population, 17 are cities of from 10,000 to 30,000 population, 36 are towns of from 5,000 to 10,000 population, 230 are towns of from 1,000 to 5,000 population. The remaining 208 are hamlets of less than 1,000 inhabitants.

It is unnecessary to be an expert mathematician to deduce from these figures the esteem in which municipal operation of electric utilities is held by most municipalities.

Talking-Movies

THE talking-motion pictures filmed at the Atlantic City Convention have proved a popular feature at every divisional and state Convention where they have been shown.

The *Electrical World* in commenting upon them, said: "The future use of talking motion pictures will undoubtedly revolutionize convention proceedings. . . . Their possibilities are almost unlimited, and the great rank and file of the electrical industry will be able to hear the messages of their leaders delivered in their own tones and with all their individual personality and forcefulness."

Since the reception of the movietone pictures has been so cordial it is very likely that other features of general interest to the industry will be filmed for presentation not only at sectional conventions but before meetings of company employees, clubs, and other organizations.

Reviews and Future Plans

THE annual reports of the Engineering National Committee are for the first time printed in the N. E. L. A. BULLETIN instead of being published as convention reports, as in the past. These reports, which are summaries of the work of the several committees during the past administrative year provide not only a reference work for the use of the present and future members of the interested committees, but to executives, and to other interested persons who might not have had ready access to the reports, they give a fair picture of the important activities of the Engineering Section and the problems which they are encountering and solving.

It is expected that the committee chairmen will prepare for publication in an early issue of the BULLETIN a synopsis of work projected for the coming year. It is believed that by thus publishing the immediate plans of the committees better cooperation, and better coordination of work can be achieved.

Of First Rank Importance

AS the magnitude of the industry increases it becomes just so much more important that contacts with the public be of the most cordial nature. The size of most companies, with the corollary of varied personalities of the employees, necessitates a certain codification of public relations policies for the general guidance of the company personnel.

Admirable examples of such workable policies are given in the articles by Messrs. MacLeod and Vincent in this issue. The maintenance of good Public Relations will always be a matter of first rank importance to the electrical industry.

Science and Progress in the Industries

By JOHN J. CARTY

THE unparalleled advances which have been made by the members of this Association in extending the benefits of light and power even to the most remote hamlets of the land, are due to many causes, scientific, economic, and administrative. You have made enduring contributions to the economic welfare of the country, which are destined as time goes on to bring about in our social and industrial life still greater improvements, the nature of which we can as yet only dimly perceive. Fifty years ago, service such as you are now rendering to the public was unknown; it did not then even exist. But today this service which you have organized is so vital that without it the present industrial structure itself could not exist. Behind all this lies a story of American enterprise, of administrative capacity, and of a public service effectively rendered, which is worthy of the admiration of all.

What History Will Show

The historian of the future, writing with that perspective and with that detached state of mind which comes with the lapse of time, will find in the achievements of the members of this Association material for one of the most interesting chapters in the history of American industry. While he will justly appraise the effectiveness of your organization, and the spirit of service which actuates your employees, he will show much better than can now be done how dependent is progress in your industry upon the advancement of science.

It has been said that, next to the verdict of history, the observations of foreign contemporaries are calculated to give a trustworthy estimate of the achievements, the progress, and status of a nation. There may be enough truth in this to afford some measure of justification for me, as an engineer outside of the electric light and power industry, in venturing to discuss some of the relations of science to the remarkable progress which you have made. I shall speak, therefore, as one interested in the advancement of science, but detached from your activities—commenting as an observer who has followed attentively the progress which you have made in your industry from the time of its inception.

General Carty, prior to his becoming Vice-President of the American Telephone and Telegraph Company in 1919 was Chief Engineer of that organization.

This address was made at the 52nd Convention of the National Electric Light Association held at Atlantic City, N. J., June 3-7, 1929.

Research in Applied Science

One of the outstanding factors in the success of the electric light and power industry is its encouragement and support of laboratories for research in applied science. In the operation of these laboratories, millions of dollars are expended each year, and thousands of men are employed, including engineers and scientists distinguished for their achievements in so many departments, including physics and chemistry. They have perfected generators, motors, transformers, and prime movers. They have made contributions to transportation, commerce, and industry. They have provided agencies for the advancement of medicine and surgery, and they have contributed in countless ways to the social welfare. Every individual, whether on the farm or in the office or workshop, whether at home or in a hospital or at church or in the theater, is receiving the benefits of these achievements. Whether traveling on land or at sea or in the air, our safety and comfort and ease of transport are dependent far more than is yet realized upon the work of your industrial scientists. Volumes would be required to show how their manifold products have transformed and enriched our daily lives.

But let me give a specific illustration which seems to be in a special manner appropriate on this occasion which marks the semi-centennial of the incandescent electric light, which was the invention of our great scientist and inventor, Thomas A. Edison. Let us go back only to the year 1907, which marks the introduction of the metallic filament lamp, and consider some of the progress which has been made in the electric lamp since that date.

By the year 1907 the improved carbon lamp, as the result of incessant scientific experimentation, had reached an efficiency giving an illuminating power of about 3 lumens (3.4) for each watt of energy employed. In that year, 1907, and as the result of profound research conducted by distinguished scientists in your industrial laboratories, a great forward step was taken in the introduction of the metallic filament lamp, which rapidly displaced even the best of the carbon lamps.

The tungsten filament lamp of 1928, which is the one now in general use, yields more than 14 lumens (14.5) per watt of energy. Thus it is more than 4 times (4.26) as efficient as the best carbon lamp of 1907, assuming in the comparison the same average size and the same hours of life.

Trustworthy figures show that in the United States alone, during the year 1928, the total expenditure by the public for lighting by means of the incandescent lamp was, in round figures, $600,000,000. If that same amount of illumination had to be provided by means of the best carbon light of 1907, then more than 4 times (4.26) as much electrical energy would have been required, and the bill for lighting which the public would then have to pay would be multiplied accordingly. The $600,000,000 would become $2,556,000,000. Were it not for the reduction in the cost in the generation and distribution of electric current which you have brought about since 1907, this figure would have to be increased by $300,000,000. From this it will be seen that the total reduction due to these items alone is now well over two billion dollars a year (2,256,000,000).

Improved Methods

This sum, almost incredible in amount, represents a cost reduction brought about by one of the products of the electric light and power laboratories—the modern tungsten filament lamp—and by the improved methods of generating and distributing current which your scientists have developed. These figures will grow larger each year, even though no further improvements should be made. They take no account of the savings due to the prices at which incandescent electric lamps and electrical machinery are now sold when compared with the prices of 25 years ago. Nor do they include any appraisal of the contributions which your industrial scientific research has made to the present unparalleled prosperity enjoyed by American industries.

These figures furnish the simplest method of emphasizing the progress which science has made in your industry in the generation and distribution of electric light and power. But taken alone they do not tell the whole story, for upon reflection it will be seen that without these reductions in cost a large proportion of the public now enjoying the benefits of light and power would be wholly deprived of the advantages which they now derive from your service. The remainder of the public which would still be carried on your books as customers, could not afford to use the electric current in such large quantities as they now do, and to employ it in such a great variety of useful and profitable ways.

The slowing down of the industrial and other activities of the country which would have resulted from such a curtailment in electric service, would connote an economic loss which it is impossible to state in pecuniary terms. Whatever it may be, the sum which represents the debt of society to your industrial scientific laboratories must be so large as to be almost incredible.

In endeavoring to appraise the value to the public of research in applied science conducted by your industry, I have employed a method which I have used in estimating in pecuniary terms the value to the public of applied science in the telephone art. On previous occasions I have given the results of these estimates, so that at this time I will only say that there, likewise, I have found that as a result of the scientific researches in the company laboratories, sums of money similarly great have been saved to the telephone users; while the service has been constantly improved and extended into every section of our country, and across the ocean, even now rapidly bringing the nations of the earth into speaking communication with each other.

Let me pause for a moment to mention the name of Alexander Graham Bell, the inventor of the telephone. It is only a few years since he passed away. If he were still alive, we can feel sure that he would be here upon this occasion to pay tribute to his friend and fellow-citizen, Thomas A. Edison, the inventor of the incandescent light, who is also the inventor of the carbon telephone transmitter, and the inventor of the phonograph. This unites his name in an especial manner with that of Bell. The one revealed the method of transmitting the human voice through the vastness of space, and the other, through the ages of time. As a long-time friend of Mr. Edison, and as one who so greatly admires his genius, I wish that I could adequately express my appreciation of his achievements. This I could hope to do if I could speak in the eloquent language that Bell himself would use. But it is not within my power to put in words the message which one of these immortals would give to the other. It gives me great satisfaction to be able to join with so many millions of others in honoring Mr. Edison and adding to their's my own congratulations and felicitations.

Practical Results

The scientific industrial research conducted in your laboratories is often called "research in applied science." Applied science must submit its findings to the criterion of utility. It must produce practical results, things that can be used with advantage, perform new services, or bring about new economies. It must continue to pay for itself and yield a profit. Otherwise it must cease. The figures which I have presented and the evidence which I have submitted, abundantly prove the extraordinary value of the researches conducted in your laboratories. Your applied science does pay for itself, and more. Your industry could not exist without it. You cannot allow it to cease, and you will continue to prosecute it with ever-increasing success.

But I have already said so much, and there is so much more that could be said, showing the importance of scientific research conducted for the sake of utility and economy, that there is danger of losing sight of another form of scientific research which has for its primary object neither of these things. I refer to scientific research conducted purely for the sake of extending the boundaries of knowledge, discovering the laws by which nature operates, and determining the principles of mathematics, astronomy, biology, chemistry, and physics.

Pure scientific research is conducted with a philosophic purpose, for the discovery of truth and for the advancement of learning. Investigators in pure science may be likened to explorers who discover new continents or islands, or hitherto unknown territory. They are continually seeking to push forward the frontiers of knowledge. Their work is conducted without any utilitarian motive, for as Huxley says "that which stirs their pulses is the love of knowledge and the joy of discovery of the causes of things . . . the supreme delight of extending the realm of law and order ever farther toward the unattainable goals of the infinitely great and the infinitely small, between which our little race of life is run."

The pure scientists are the advance guard of civilization. By their discoveries they furnish to the engineer and the industrial chemist and the other applied scientists the raw materials to be elaborated into manifold agencies for the amelioration of the condition of mankind.

Let me illustrate this by the work of Scheele, a Swedish scientist, who in 1781 made a fundamental discovery respecting tungstic acid. He furnishes a classic example of the motive and achievements of the investigator in pure science. Aside from his pioneer work in tungsten, independently of Priestly, he discovered oxygen. He also discovered manganese, chlorine, barium, and molybdenum. Truth, not utility, was his criterion, for in one of his letters, he said: "It is the truth alone that we desire to know, and oh, what joy there is in discovering it!"

Subtract from our present stock of scientific knowledge the body of truth which he contributed, and applied science as we now know it would be dwarfed, and it is impossible to imagine what would be the backward state of the industries based upon it.

Workers in Pure Science

Growing out of the discoveries of Scheele and inspired by his example, two of his pupils, the brothers d'Elhuyar, were the first to isolate and produce metallic tungsten. Were it not for the knowledge gained by these researches in pure science, the very existence of tungsten would be unknown. The tungsten filament lamp would be an impossibility, and the manifold benefits and economies which the public now enjoys as a result of its use, would not be realized. As to the effect of this upon your own industry, you yourselves can make the best conjecture.

Let me give some other examples of the results which have ultimately followed from scientific researches conducted only for the purpose of discovering new truths or principles.

In the early part of the last century, Hans Christian Oersted, Professor of Natural Philosophy at the University of Copenhagen, made the great discovery that an electric current flowing in a wire could move a magnet; and less than one hundred years ago, Michael Faraday, conducting researches at the Royal Institution in London, discovered that a moving magnet could generate a current of electricity and that one current could generate another. Joseph Henry, a Princeton professor, and later Secretary of the Smithsonian Institution, independently of Faraday, discovered the laws of current induction. He also made other fundamental contributions to our present stock of scientific knowledge.

This list could be extended at very great length, giving the names of thousands of investigators in the domain of pure science who have contributed knowledge which is indispensable to modern industry and to applied science in all of its branches.

But let us consider the incalculable benefits which the whole world has derived from the knowledge of scientific principles and laws contributed by only three of these great men—Oersted, Faraday, and Henry. If we did not have this knowledge, the electric telegraph and the electric light would be unknown; neither Bell nor anyone else could have invented the telephone; there would be neither dynamo nor motor, and your industry would never even have been thought of; your Association would not exist; and we would not at this time be celebrating the great achievement of Edison in the invention of the electric lamp.

The Future

I have stated in terms of money some of the debt which we owe to your own workers in applied science; but it would tax the powers of the human mind to estimate the prodigious sums which have been added to the wealth of nations by the contributions of the investigators in the field of pure science seeking only to discover the truth.

I have spoken of the past, and now let me speak of the future. There are countless practical problems now confronting mankind which never can be solved by the applied scientist in the present state of scientific knowledge. He must await further fundamental discoveries and new scientific generalizations yet to be furnished by the investigator in pure science. Unless the work of the pure scientist is continued and pushed forward with ever-increasing energy, the achievements of the industrial scientist, in the course of time will become more and more restricted. Already the applied scientists have perfected your dynamos and motors and transformers, so that they are working at 95 per cent of their theoretically perfect efficiency.

Stock of Knowledge

While without any increase in our present stock of knowledge in the realm of pure science, the applied scientists would find abundance of profitable work to do, nevertheless in the long run they can proceed no faster than the discoveries of pure science permit. It is of the greatest practical importance, therefore, that we should do everything in our power to encourage and support the work of the pure scientists who are to be found in all of our universities and scientific institutions. The discoveries made by these learned men have no immediate practical value, and could not therefore bring to them or to their institutions any pecuniary return. Unlike applied science, pure science cannot support itself. It must depend upon contributions of money from the public, from far-sighted patriotic citizens and men of affairs; from business and commerce and the industries which derive their prosperity or very existence from this field of human endeavor.

The possibilities of research in pure science are boundless, because the resources of nature are without number. Great as are the scientific accomplishments of our day, they are small compared to the possibilities of the future. Two centuries ago, Sir Isaac Newton, the discoverer of the law of gravitation, who ranks perhaps as the foremost scientist the world has ever known, expressed his faith in the infinite possibilities of science in these words: "I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me."

The scientific developments since the time of Newton so strikingly confirm this vision of the great philosopher that we can feel certain that, if pure science is properly supported, the discoveries of the future will be enormously great in comparison to those which have already been made. Future generations of Americans may look upon us with our present limited knowledge of the forces of nature, as we now regard the American Indian, who, cold and shivering in his scanty clothing, was ignorant of the coal at his feet, with its stores of heat and power.

Constitution of Matter

Although seriously hampered and restricted by the lack of funds, American investigators in pure science are pushing forward their work with courage and determination. Among the thousands of problems which occupy their attention, they are attacking the most fundamental of all—the ultimate constitution of matter, the structure of the atom, and the nature of the electron. On the summit of Mount Wilson in California, the astronomers are observing in the sun and in the stars and in the nebulae not only worlds in process of evolution, but what is most astonishing, the evolution of the chemical elements themselves. In laboratories at the base of the Mountain, chemists and physicists are attempting to reproduce, with increasing prospects of success, conditions which have been discovered in the depths of the universe. They are splitting the atom into its parts, and their work is filled with the greatest promise. From it I believe science will some day learn how to take the elements apart, and put them together again in new and most remarkable combinations. Already they have found that in the depths of space, hydrogen is being transmuted into helium, oxygen, silicon and iron. They have discovered that the material substance of the faint companion star of Sirius has a density of one ton per cubic inch; while a cubic inch of the material composing another faint star recently studied at Mount Wilson may weigh as much as seven tons.

I believe that in the course of time, if these investigations can be carried forward to success, our applied scientists will be able to provide new structural materials and metallic alloys, lighter or heavier, as may be desired, cheaper and more durable and capable of resisting corrosion. Researches such as these should be multiplied a thousandfold. They will give us the answer to the great problem of drawing upon new sources of energy, and of utilizing those already available with the highest economy and efficiency. No inquiries could go more deeply to the foundations of industrial progress than these, and none could hold forth such promise of continued prosperity and of such advancement in all human affairs.

If there were time to do so, I could show the necessity for conducting pure science research not only in those fields which I have already indicated, but I could explain why it is essential to prosecute such researches with the utmost vigor, in every department of science without any exception whatever.

Because it was convenient, I have stated some of the results of science in terms of money. But the value of science can best be measured in terms of human achievement, the mastery of the forces of nature, the elimination of poverty and disease, the prolongation of life, the advancement of learning, the growth of right living and sound thinking and of good understanding among men. Pure science research is indispensable to the attainment of all of these ends. According to the present vision of science, life must no longer be regarded as a struggle among men for a limited store, where one man's gain or one nation's gain must be another's loss. Under the banner of science, we are asked to join with our fellowmen working together in controlling and utilizing the bountiful forces of nature.

"Science," said Pasteur, "is the soul of prosperity of nations and the living source of all progress." American business and commerce and industry and the whole of the American public are being asked to give and to continue to give to pure science research, in our universities and elsewhere, that support which it so greatly needs. For all the benefits which it is conferring upon us, science asks only that we provide its zealous workers with an opportunity to multiply their efforts in our behalf. Upon the answer to this call depends the future prosperity of the nation.

Countrywide Activity in National Food Preservation Program

ACTIVE work in development of local Food Preservation Programs has been a feature of the past month in the National Food Preservation Program, the movement for public education in the need for proper refrigeration. Local Councils in a large number of cities in all parts of the country have completed their organizations, and requisitions for tie-up materials from a number of other points show that active work is also under way there.

One of the most pleasing aspects of this early activity in the Program is the unanimity with which all factors concerned in the problem of food preservation have joined forces in making the work of the Local Councils successful. Ice manufacturers and distributors, makers and distributors of ice-cabinets and all kinds of refrigeration machines, dairies, meat distributors and organizations and individual firms which are concerned with food distribution; public health agencies, women's clubs and civic organizations have all responded to the invitation of the National Food Preservation Council to participate in this movement.

Regional Directors have been, in nearly every instance, taking leaves of absence from commercial work in order to travel throughout their territories and perfect the local organizations. National Headquarters of the Program has also sent trained organization men into the field to assist the directors in this work, and aid the Local Councils in getting started to function properly. City chairmen have been very unselfish in devoting their time to this undertaking, and pushing it in their localities.

National Magazine Advertising of this Program is already in the hands of publishers, and will appear in a steady stream in September magazines, which will reach the public between August 10—when the September issue of Cosmopolitan reaches its readers—and September 12, when the second of the two advertisements in *The Saturday Evening Post* reaches the news-stands.

The magazines, in addition to the educational matter about food preservation, pointing out the necessity of keeping foodstuffs at an average temperature below 50 deg., and above 32 deg., fahr., will contain announcements of the $25,000.00 National Idea Contest. This contest, in which 835 prizes ranging from $10,000.00 down to $5.00 will be awarded, is expected to produce a greatly heightened interest in the subject of food preservation. To aid its work of education to the greatest possible extent, a book written by Mrs. Elizabeth Stone MacDonald, widely known authority on home economics, giving a detailed picture of the subject and explaining the contest, has been prepared. This booklet will be distributed by Local Councils, and local participating agencies, and readers of the national magazine advertisements will be referred to these local sources, and advised to secure a copy of this booklet through them.

The essays are to be headed, "Why 50 Degrees is the Danger Point," thus making each of those who sends in a reply a student of the requirements of proper food preservation. How many will be interested in this Program by the National Idea Contest may be judged by the records of past contests. The National Essay Contest of the Laundryowners National Association, two years ago, was participated in by more than 1,000,000 women, and those familiar with that contest declare that there were undoubtedly many more who made a study of the working of the laundry, and prepared to enter the contest, but did not do so.

Because this Program is receiving local publicity the results of this contest should be even more impressive. The influence of the contest in building public interest in refrigeration and food preservation, too, can be greatly enhanced by holding local contests, with local prizes, correlated with the National Idea Contest. Plans are being made by a number of Local Councils to hold such contests as part of their public activities in the September drive on public opinion.

The movement is one which should receive support, not merely because of its commercial possibilities, but because of its civic value. The problem of food spoilage, and disease and wastage brought about by careless methods of handling perishable food, is one of very serious proportions. The endorsements which have been received from national associations which are interested in the problem of supplying the nation's food stuffs—the latest of which is the United States Fisheries Association, Inc.—testifies to the vital need which is felt for education in this direction.

Complete Service

Ideals and Accomplishments of the Public Relations National Section

By MARTIN J. INSULL

JUST about ten years ago, a committee of the Investment Bankers Association reported to its convention as follows:

> **"In previous reports your committee has referred to the advantages which would accrue, both through the development of cordial relations between the utilities and their customers and through increased confidence of investors in public utility securities, from the dissemination of more complete and comprehensive information concerning the economics of the public utility business. A public fully and correctly informed will offer sterile ground for the arts and deceptions of the demagogue."**

As we look back, it is evident that, at the time this report was written, the relations between the operating companies and their customers were not entirely cordial; nor was there a complete confidence in public utility securities on the part of investors. The industry as a whole was not informing the public in a complete and comprehensive way about its business.

A Criticism of the Industry

This was a criticism of the public utility industry. It was not the first one, and in order to impress upon the industry that it was being criticised and to make that criticism, though polite, as severe as possible, the committee called attention to the fact that this matter had been referred to in previous reports.

While this report was not the only cause, it was one of the causes that made the industry give some serious attention to more fully informing the public about its business. By this and similar indications, the industry was brought to realize that, in its preoccupation with financial problems and urgent construction and operating responsibilities, it had been overlooking the important duty of keeping the public informed of its activities.

Toward that end, the National Electric Light Association, at the convention of 1920, authorized the formation of the Public Relations National Section. How necessary that Section was at that time is indicated by the Investment Bankers' report from which I have quoted. The Public Relations Section has proved its continuous value by the changed attitude of our customers and of the public in general toward our industry, and that of the investors toward the securities of our industry. You seldom, today, hear of any trouble between operating companies and their customers, indicating that "cordial relations" have been developed. The headlines of the financial pages of the daily press bear evidence to the "increased confidence of investors in public utility securities." The public as a whole has received "more complete and comprehensive information concerning the economics" of our business largely as a result of the work during the past nine years of the Public Relations National Section, the direction of whose activities now rest in the hands of those here today.

Mr. Insull, President of the Middle West Utilities Company, was President of the National Electric Light Association in 1920-1921 and served as Chairman of the Public Relations National Section during 1921-1922. This address was delivered at a meeting of the Executive Committee of the Public Relations National Section held at Chicago July 17

A Great Responsibility

You have assumed a great responsibility, because upon you rests very largely the success of a great industry. That success can only be assured by a favorable public opinion, which, if properly informed, cannot be anything but favorable toward an industry upon which the business and social progress of the nation so largely depends. It is the section which you direct that has the duty of so informing the public in every honest way that you can devise.

In devising and applying the various means of cultivating well informed public opinion, you not only broaden your own knowledge of the industry, but you are at the same time educating the army of men and women employes to a broader and better service to the public, which in itself tends to intensify that favorable public opinion upon which the success of the industry so largely depends.

Complete Service

We all agree that good service is the prime requisite. But service must not stop at the lamp socket or the motor. It must, in addition, carry with it a well-informed personnel that can intelligently answer the inquiries of the public—a personnel trained to understand that their gratuitous personal service to the customer is just as important to the success of the industry as the operating efficiency which it is the customers' right to expect. Not just a silent utility service, but a human service. Not a "public be damned" service, but a "public be pleased" service. There is no maudlin sentimentality about this. It is just good business. We are in business to succeed, not to fail. We cannot succeed unless we have the good will of our customers, the public, because the investor on whom we depend for capital with which to carry on our business is not going to invest in a business to which the public is antagonistic.

It was certainly evident from the report from which I have quoted that public relations work was necessary, and as the public in the natural course of events, is always changing, public relations work is and will always be necessary. We must never stop informing the public and educating ourselves and our employees in the fundamentals of our industry.

As to how successful our work has been, the effects on the public mind of the investigation now being carried on by the Federal Trade Commission is some indication. With the exception of the sensational press and in spite of their exaggerations of the occasional mistakes that have been uncovered and their disregard of all the great constructive work of the industry, very little interest has been displayed by the public at large in the investigation. Certainly the investors' confidence in the industry or its management has in no way been shaken. We cannot assume that this would have been the case had it not been for the informational work of this important Section.

How much criticism of faulty service do we hear? How much complaint or dissatisfaction at that all-important point of contact between the operating company and the public? How many instances do you know of complaints about rates by the people actually paying those rates? I see little sign of any quarrel in these relationships. What I do see is a fictitious struggle between a mythical "consumer" and an abstract "power trust" which does not exist.

A Big Job Requires Bigness

This is a strange and paradoxical situation but it must be dealt with. To a large extent, it is due to this—the public fails to connect up the local company, which it regards highly, with this somewhat mysterious electric industry that it reads about in the papers. Can't we show them the simple fact that the electric industry as a national institution is simply the sum of all the neighborly people who furnish their electric service locally? Its bigness is simply the bigness of our nation. You remember the famous remark of Speaker Reed of the House of Representatives back in the nineties. Somebody was shocked to find that Congress had appropriated a billion dollars. Speaker Reed answered simply, "This is a billion dollar country." Today it is a bigger country than ever. If people keep that in mind they will see no evil in the mere bigness of our business—they will realize that it must be big to do the big job it is responsible for.

Why Shouldn't Government Ownership Be Opposed?

A great deal of attention has been given by the investigators to the industry's opposition to governmental ownership and its informational work along that line. Why should not an industry responsible for so much of the money of the saving and thrifty people of the country defend that investment to the best of its ability against attacks by proponents of the government entering the business? Is there any other position that the men of the industry on whom the public rely for the safety of their investment could take, feeling that every effort towards government ownership and operation points toward a general scheme for the nationalization of the whole electric light and power industry?

It is certainly within the rights of the industry to assert its belief that government should do only such things as the people cannot do for themselves; that government has no business going into business, and that the continual encroachment of government in all lines of business will ultimately undermine this country's wonderful experiment in democracy. The very newspapers that criticize the electric light and power industry would be the first to loudly complain if the government went into the newspaper business, or even attempted to regulate its service and its profits. The unfortunate thing is that business as a whole stands idly by while the government goes into the other fellow's business, overlooking that theirs may be the next attacked. Has not the time arrived when all business should combine to make it thoroughly understood in this country that the proper function of government is to govern business, not engage in it, and that industry has the right to protect itself against such a course by any honest and truthful means that it can use? Should the leaders of industry be condemned for their efforts to protect from such attacks the capital for which they are trustees?

A Right and a Duty

The electric light and power industry should be opposed to government ownership and operation not only of its own, but of all other industries, and it has the right and it is its duty to take that position before the people in every legitimate way. This country has been built up on private initiative, ownership and operation until it has reached its present preeminent position as an industrial nation. Should it now, while other nations are turning toward its method of development, reverse itself and embrace government ownership and operation of industry which they, as far as they are able, are discarding?

Every effort should be made to efface from the public mind any misunderstanding with regard to the industry's activities in the schools and colleges. Our educational efforts in the schools have been purely factual and have dealt only with the physical and economic aspects of our business. They have been directed toward supplying the coming generation of business men and women with a better understanding of the public utility business. Our business differs from the businesses with which most people are familiar. It has a very slow capital turnover—once in five to six years—while many others turn their capital five or six times a year. For this reason it cannot supply increased facilities out of earnings and is, therefore, constantly in the market for its new money. It is a natural monopoly because the duplication of service would mean an economic waste of large proportions. People are naturally opposed to monopolies, and especially so if they do not understand that there are real economic reasons therefore. Toward the end that there may be future utility leaders educated in some of the fundamentals of the business, we have fostered courses in public utility management, economics and financing in some of the schools of commerce of our universities. As these great services must be carried on, surely this is in the public interest.

A Correct Public Understanding

Undoubtedly in a national informational campaign on any subject, some details unfortunately will creep in that can be criticized, and especially at a time when those opposed to it are looking for things to criticize. But there is nothing wrong with the fundamentals of the utility industry's effort to inform the public regarding its important position in the social and business life of the nation. In fact, one of the great dangers today is that certain lines of business are outgrowing public understanding because of their size alone. Such businesses can offset this only by using every means in their power to bring about a correct public understanding. It is this that the Public Relations Section should do for the electric light and power industry.

It is, perhaps, difficult to distinguish between information as a duty to the public and information as sheer selfishness. Both motives, as it happens, would in most cases lead a business to the dissemination of the same facts, for it is generally true that a business must take the same stand in stating what is best for the public as it would take if it were stating simply what is best for itself. All this means is that the business has so shaped its policies that its interests are consistent with the public interest.

Better Business Ethics

Fortunately, during the last thirty years we have seen a beneficent change in the ethics of business, our own included. The day of business for profit only and the spirit of "let the buyer beware" is largely a thing of the past. Today we have a much higher spirit of business—the spirit of service to the public, humanitarian treatment and fair wages for employees, good working conditions and provisions for old age and for dependents. The outcome of these changes has been public appreciation of the principle that capital invested in business—which, as a matter of fact, belongs to the public—is entitled to fair wages. The public now realizes that it cannot receive good service from a starved corporation. This has brought about a far better understanding between large business enterprises, their employees and the public. A mutual confidence has been built up.

Business must do everything possible

Martin J. Insull Prize Paper

A Public Relations Yardstick

By ROB ROY MACLEOD

"I wud the Laird the giftie gie us
To see ourselves as ithers see us."

AND, after all, we can build public confidence—good public relations, if you prefer—only when we are honest with ourselves; when we see ourselves as others see us. Character in an individual or an institution merits and receives respect. It is the result of searching out weaknesses and eliminating them.

Flattery is the most pleasing—and most useless—thing in the world. It serves no useful purpose, but, on the contrary, blinds us to our faults and weakens character. It makes us, like the ostrich, hide our heads in the sands of complacency, and failing ourselves to see our faults, believe that others cannot see them. Self-flattery is a false friend to an industry which is seeking better public understanding.

If this discussion seems inordinately critical, if it seems to older and wiser heads than that of the writer that it is too idealistic, please remember that it is critical and idealistic only in the hope that it may be a helpful contribution to the industry. The writer is fully aware that fools rush in where angels fear to tread.

So much for the preliminaries. Now let's roll up our sleeves and go to work.

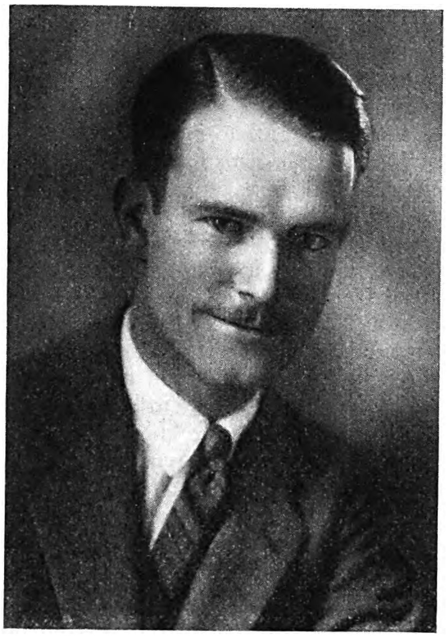
Electric service is possible because of five factors—stockholders, management, employees, customers and plant. All are equally important; all have certain responsibilities.

We shall, in this discussion, take up each factor in turn and consider its bearing on public relations. We shall set up an ideal—a yardstick by means of which each one of us can measure his own organization and determine how far short of the ideal it falls. Having found our weak spots, having seen ourselves as others see us, we can build character in our institution, build public confidence, build good public relations.

THE STOCKHOLDERS

Customer ownership was not a step toward better public relations—it was a flight of stairs.

Every company should be interested in the widest possible distribution of its securities among its customers. More than that, it should be active in securing that distribution. One who is financially interested in a company is deeply interested. Where his dollars are his allegiance goes—provided that everything possible is done to safeguard his dollars and make him proud of his allegiance. But the industry is too well sold on customer ownership for us to dwell longer on its merits.



Mr. MacLeod's paper won the Martin J. Insull prize award for 1928-1929. Mr. MacLeod is manager of the Publicity Department of the Buffalo, Niagara & Eastern Power Corporation. He was a graduate of Boston University in 1923, with the degree of Bachelor of Business Administration.

How may we secure wider customer ownership?

Investment departments should be maintained by the larger companies. Here Mary Tapp, the typist, and Joe Piccard, the laborer, may buy securities on the instalment plan. Here the uninformed investor may learn the difference between bonds and preferred stock. Here the widow with her small insurance fund may bring her investment problems and receive courteous, considerate treatment.

The investment department may render a splendid public service to the small and the large investor, particularly the former, by exposing the fraudulent stock promotion and bringing about the safe investment of funds in the fourth largest industry of the country. The small investors' dollars and favorable opinions are just as valuable as those of the wealthiest citizen. In fact, a large number of small stockholders is more to be desired than a small number of large stockholders for both financial and public relations reasons.

Smaller companies must use other means of spreading customer ownership. There are two leading methods—through employee campaigns and through cooperation with banks or brokers. When these methods are employed, strict control is necessary.

Employees, in a brief campaign, cannot be converted into full-fledged security salesmen. They can, however, be given the essentials and kept from waxing too enthusiastic in their statements. Customers should not, for example, be given the impression that a preferred stock with a fixed dividend will appreciate in value with the development of the company as an equity stock would. Misrepresentation, whether intentional or unintentional, can breed only ill-will.

Outside agencies, brokers or banks—sell securities for one reason only—profit. If they are to function as an investment department for the electric light and power company they should understand definitely the company's policy in customer ownership—straightforward statements of fact. Not even "shrewdness" is permissible. And a partial payment plan should be offered, by all means.

Very well, we have secured our customer stockholders. What are we going to do about it? Shall our entire contact with them be limited to a dividend check four times a year? Decidedly not.

With each dividend check we send a brief printed message. It may be the quarterly financial statement, the announcement that a new office, substation or store has been opened, the story of a large new industry added to the lines or any fact of interest to them.

Every year we send them our annual report, containing complete financial statements and an account of our stewardship of their property during the year. In this we display a map of our territory, we point out how sales have increased and earnings with them, we tell what we are doing to stimulate the development of our business, we tell about the part we play in human progress, and we reiterate our public policy.

Every month we send them a tabloid newspaper giving them the intimate details of what is going on in their company. A new line is built here, new equipment is added there, a tax bill of so many thousand dollars is paid, a lineman uses prone pressure and saves a child's life—and so it goes.

But that is not all. Every new stockholder who joins the family receives a personal letter from the president—not a mimeographed letter, but one written on the automatic typewriter and actually signed by the president—welcoming him, enclosing a copy of the last annual report and stating that he will receive the newspaper every month. Furthermore, he is told that criticisms and suggestions will be welcomed, and that questions in regard to the company will be answered promptly.

Now we come to the annual meeting. Our stockholders get the notice required by law, in all the glory of its tortured legal English. They also get a letter from the president, whether they live in our town or Timbuctu, urging them to attend the meeting. Of course, many of them can't come, and so they send in proxies. We acknowledge their proxies and thank them for the confidence which they have in us. We tell them that the action of the meeting will be described in the next issue of our newspaper.

At the meeting those who attend see the men who are responsible for the management of their property. The officers and directors become creatures of flesh and blood rather than mere names. The president, in a brief talk, does even more to personalize—to humanize—that mysterious thing we call the company.

Will our stockholders be enthusiastic? Will they give us that most valuable of all publicity—word of mouth advertising? Will they help us build sound public relations?

THE MANAGEMENT

The typewriter with which this was written was an ugly lump of ore. Man made it into a useful machine.

An electric light and power company is a corporation, "an aggregation of individuals, having the legal right to sue and be sued," as we were told in the economics class. Management makes it a glowing, living thing—a vital public servant.

Great are the responsibilities of management! It must coordinate the capital supplied by the stockholders, the efforts put forth by the employees and the physical facilities of the plant to provide service—good service at reasonable rates—to the customers. Management is the keystone of our arch.

To the management we must look for our public policy. From the management, to a large extent, the institution draws its character. Are the men at the helm broad-visioned, honest, community-minded, straightforward and trustworthy? So is the organization. Are the men at the helm narrow, shifty, selfish, subtle and undependable? So is the organization. The future of the electric light and power industry depends entirely upon the character of the men who control the destinies of the individual companies.

The ideal electric light and power company executive may easily be described. He is a man of vision. He sees his company as a contributing factor in the progress and prosperity of the communities which it serves. He takes an active interest in public affairs and is looked up to as a civic leader. There is no smirch on his record in either private or public life. He is not barricaded behind mahogany walls and guarded by a hydra-headed monster in the guise of secretary, yet everyone knows his time is not to be wasted on trivial matters.

He is absolutely reliable, and a promise which he makes is always fulfilled. He is courteous and considerate of everyone, yet he knows how to say no, and mean it. The policies he lays down and the orders which he issues are reasonable and just. He realizes the power which is vested in him and uses it for the good of his community and his company. His men are proud of their captain, for he knows how to praise as well as how to criticize.

No such man exists? Yes, indeed! This writer knows four such men in the industry from his own limited personal experience.

When management is composed of such men, the institution assumes its character from them. Such an institution merits and receives public respect and enjoys good public relations.

THE EMPLOYEES

Marvelous has been the increase in efficiency of steam and hydro-electric plants. Remarkable has been the development in the art of transmission. New machines, new controlling apparatus, new ways of doing things—the electric light and power industry in the last few years has written a vital chapter in American industrial history.

We have done wonders with stone and steel, with copper and concrete. The part which they play in our work is subject to engineering attack—we figure the stresses which they will stand on slide rules, we study their characteristics and calculate mathematically how we can use them to greatest advantage.

The human element in our industry—employees—cannot be reckoned with such nice precision. Our slide rule fails us; our mathematics are set at naught. The waste of man power—and it goes on in every industry—is tremendous.

Could we stimulate only one-half the latent brain power in the employees of our industry, we would unleash a stagnant resource fully as valuable as the water power of our country, its petroleum reserves, or its coal deposits.

What shall we do to reach this rich mother lode which lies buried in our own back yards? We must inculcate our public policy into every employee, inform him fully in regard to our company and our industry, make him our enthusiastic representative in all his public contacts and stimulate him to think constructively.

This is a large order, but we shall fill it because we know it can be done!

We must have an Employees' Relations Department—although in smaller companies it may be a single individual—as a clearing house for this important work. Here all messages from the management will clear, here employees' records will be kept, here accident prevention work will have its origin, here employees may bring their financial, occupational—yes, even marital—troubles. This department will be generally responsible for getting our message across to our employees.

In the construction, operating, engineering, accounting and similar departments, where employees have comparatively little contact with customers during working hours, we hold regular get-togethers for the foremen and other pivot men. We sell these men, and if we do it well they sell the men under them.

Cashiers, meter readers, salesmen, clerks and other employees who meet our customers daily have different problems and require different treatment. For them we conduct meetings at which officers and key men of our company appear as speakers and deal specifically with their problems. Perhaps some members of the first group evince such a lively interest that we bring them into the second group for more intensive training. Thus we discover a line foreman who can double his salary—and his usefulness to us—as a salesman.

We cover the same subjects with each group, but we go into greater detail with the second, for it contains most of our public contact. We outline our public policy, tell how we regard our job as a public service company. We explain how we are manufacturers, wholesalers and retailers, all in one at a single profit, and how we are closely regulated by the State. We stress the importance of courtesy and consideration in dealing with customers, and tell every employee that we expect him to live up to the company's policy. We prove the value of favorable public opinion, and show each employee that he must cooperate in our effort to secure it if he is to grow in our organization.

Public speaking classes are organized from the outstanding members of these two groups. At our first meeting the president tells the members that they have been selected to carry the company's message to its customers, and that they are to be trained as speakers for that purpose. Then at alternate sessions we explain financing, rates, generation and distribution, and the more intimate details of the company's operation, followed by a study of the art of public speaking. At the end of fourteen or sixteen weeks we have a trained corps of public speakers, thoroughly qualified to discuss our business before church, civic and business groups.

Today everyone dresses neatly—it is required by present-day standards, and our employees know it. Some, however, must wear uniforms and we must sell them the idea. We must convince them that our object is not to turn them into liveried servants, but to protect our customers from fraudulent meter readers and inspectors. We point out that a uniform is simply a mark of authority and that without it the traffic cop would risk life and limb as other pedestrians do.

Our Employees' Relations Department sees to it that every employee is also a stockholder. We offer employees a special stock plan, and we save twice the concession which we make in market price through the reduction of labor turnover. In combination with our group insurance plan, this makes every employee a firm believer in his company.

We have, of course, many other employee activities, designed to improve the power factor of our employees—make their output greater and their hot air radiation less. We hold social and athletic events, we publish a house organ and an employees' manual, which includes all the information given to the groups mentioned above, we stimulate study in N. E. L. A. courses and participation in N. E. L. A. committee work. Perhaps we award a trip to the N. E. L. A. convention to the employee who makes the best showing in the study courses; it gives him fresh enthusiasm and he stimulates his fellows upon his return with a glowing account of his experiences. Each new employee gets a letter of welcome from the president, presenting the manual and stressing our public policy.

Don't forget the women! In this discussion we refer to the employee as "him," but we must remember that there are also many "hers" in our organization. The women should be given the same information and the same opportunities as the men. Except in the public speaking classes, the women should be organized as a separate group. Women will not ask questions which will make them appear ridiculous in masculine eyes; in a group of their own sex they will ask about anything which puzzles them.

The subject of employee information is too large to be covered here in any detail. But our employees have such an important bearing on public relations that we must at least touch the high spots of a crude plan to put them in possession of the information which they should have. Every employee meets at least 100 people in a year. If he is enthusiastic about his company, if he disseminates accurate information, if he makes a good impression and creates a favorable public reaction, does it help us to build sound public relations?

THE CUSTOMERS

Our customers are human beings. Because they are human beings they have all the strength, all the weakness, all the attractiveness, all the repulsiveness, all the magnanimity and all the cupidity which our arboreal ancestors brought with them when they climbed down from the trees.

We must take a broad, tolerant, humane viewpoint in all our dealings with customers. We must remember—

"There is so much good in the worst of us,
And so much bad in the best of us
That not a single one of us
Can criticize the rest of us."

Dress, appearance, speech, education or manners in a customer must have no bearing on the treatment which he receives. The reception accorded the illiterate laborer and the cultured clubwoman must be uniformly courteous. Each has a circle of influence; each is a worthwhile friend.

Our employee training, outlined in the preceding section, makes this possible. Eight different classes of employees, comprising less than 50 per cent of our staff, have the great responsibility of representing our company in the eyes of our customers. They are the telephone operators, contract clerks, cashiers, adjusters (who may also be collectors and inspectors), meter readers, appliance salesmen, linemen, and trouble shooters. These must receive special training from their respective department heads, and their department heads must be thoroughly sold on company policy. Let's take up each class in turn.

Telephone operators must have voices that radiate a spirit of service. If the meaning of this is not clear, pick up your telephone, get central, and listen to her voice. The Bell System has done more to create telephone personality in its operators than any other organization. The company operators should know how to route calls to the proper departments, and not take customers on a telephone journey through our entire organization. If the line is busy, the customer should be told so, and asked if he will wait, not informed "linzbizzy," and cut off quickly. Employees in every department should answer with the name of their department, followed by their own name. Their name is not important? Of course it is! It adds a human touch. And it is not necessary to shout over the telephone; a well modulated voice is easier on the ears.

Contract clerks have a hard job—especially in the larger cities around moving time. Customers usually don't understand the procedure of making out contracts, but that is no reason to make them feel the superior knowledge of the contract clerk. Smiles have their place, but the place for the forced smile of superiority is in last year's files. The contract clerk should feel genuinely anxious to make the signing of the contract as pleasant as possible for the customer; that feeling will be telegraphed to customers by every action. Promises to have lights on at a certain time should not be made unless they can be kept. It is much easier to explain why the lights cannot be turned on a few hours after the contract is signed, than it is to explain a broken promise. Of course service should be turned on as soon as possible, but that is not up to the contract clerk.

Cashiers must be diplomats. They must know how to receive money graciously, and that in itself is an art. Cashiers must be carefully chosen and carefully trained, for their contact with customers is at the point where disputes are most likely to arise. It is hard to make bill paying a pleasure, but a cashier with a pleasing personality can do it. And while we are speaking of bills, we must dilate upon this contact of the accounting department with customers. Bills must be neat, accurate and well laid out or they encourage disputes. Inaccurate bills are intentional in the mind of the recipient; he has caught an attempt to "put something over on him." An erasure makes him suspicious. Requests phrased in the form of orders—"Bring this stub with you"—irritate him. The public relations department should be consulted when the bill form is adopted.

There should be some one person to whom bills will be referred by the cashiers when a dispute involves the computation of a bill—in larger companies this will be a department in itself. The adjuster must understand rates and the operation of a meter; many a bill can be justified in the eyes of a customer through this knowledge. He must be level headed and have his emotions firmly under control at all times. The explosive customer quickly quiets down when he finds the adjuster self possessed.

Closely tied in with this work are meter testing, credit and collections. When there is really justification for a meter test it should be readily promised, but it should not be used as a sedative for an irate customer. A good adjuster can usually tell from circumstances whether a meter is likely to be inaccurate—10 to 1 it will be slow—and if he is convinced that the meter is right, he must sell the bill to the customer. Delinquents are usually covered by the deposit—after a year it can be refunded to those who discount bills—but the last resort is shutting off service. Of course a disgruntled customer is the result, but people who dodge their bills are not likely to be a great influence in any group.

Meter readers are good will builders or a necessary evil, depending entirely upon their training. If they track mud over clean floors, make a racket when they enter a customer's home, indulge in petty thievery or pry into things which do not concern them, they are a disgrace to the uniform which they wear, and their chief should be held responsible. One plan, district representatives, encourages a high type of meter reader by offering greater salary inducement. Briefly, the city is districted and a man assigned to each block of 400 or 500 meters. He reads meters, makes minor appliance repairs, answers questions, collects delinquent bills, sells appliances and in general acts as the *customers'* representative with the *company*.

The appliance department as a whole is a vital point of public contact. It supplies the devices—we prefer to call them electrical household servants—which make possible the satisfactory use of our service. High-pressure methods have no place in the merchandising operations of the electric light and power industry. Doorbell ringing is a nuisance. This does not mean that we must hide behind the counters and wait for the domestic load to be presented to us on a silver tray. We can be aggressive without being offensive. We maintain a testing laboratory in which various appliances are tried and only the best offered for sale. We maintain a home service department which demonstrates appliances after they are purchased by customers—absolutely essential, for example, in the case of an ironer or a range—and conducts public demonstrations to focus attention upon the electrical way of doing things. We maintain a repair department, where appliances may be put in operating condition at small cost. We offer other electrical dealers an opportunity to tie in with our campaigns, thus reaping the benefits of our advertising and sales promotion work.

Trouble shooters, those knights of the day and night, are uniformly our best good will builders. People with lights out are glad to see them anyway, and feel it is their own fault that the lights are out. But we see to it that we get the most out of this favorable point of contact. Our trouble shooters are adequately equipped and arrangements are made so that calls can be handled rapidly. Men are uniformed, for most of their work is done at night and they must be readily recognized. They are courteous and well trained. They make the customer feel that he has not committed a crime; that it is a pleasure to help him out of his difficulty. If they can determine what caused the trouble, they tell the customer, and offer to have the repair department send for it.

Now we come to the linemen. We can't make a Lord Chesterfield out of a lineman, he has his own secret code and vocabulary. We can, however, convince him that he ought to harmonize his efforts with our public policy. He can refrain from commenting so frankly on the perverseness of a lag screw when working in a residential section with women and children around. In industrial sections, where only men are in circulation, he can give freer vent to his feelings—most of us play golf. He can stuff ends of wire in his pocket rather than throw them where the customer's lawn mower will pick them up. He can clean up after each job, and leave the spot as neat as he found it.

So much for our public conduct. Of course continuous, dependable service at reasonable rates must be presumed; we will discuss it further in the section on plant.

How are we going to tell people of our aims and of the work we are doing? We have every right in the world to raise our voices in the market place and tell our story to those who use our service. Further we have a duty to tell the facts of our business, for we alone know them—not through theoretical dreaming but through actual doing.

We enter the advertising columns of the press. There we reach the ear of our customer with our appliance advertising, show him what electricity will do for him and his family, sell him the idea of doing things electrically. An entirely different job is done by our institutional advertising. It sells him our right to exist as a business institution. We show him what we have done to safeguard continuous service, we show him how, by amassing vast sums of capital, employing keen management and encouraging employees we have been able to reduce the cost of electric service while the price of nearly every other necessity of life has mounted. Only too often we are approached for "hold up" advertising—advertising which is really a contribution under duress. Treatment of this problem requires courage. We expect to contribute to causes which deserve support, we cannot contribute to many causes which are really worthy, because of their number, but we refuse to pay graft for the personal profit of individuals. Some requests we grant gladly, others we refuse regretfully and state our reasons for doing so in a straighforward manner to which no reasonable person can take offense, the third class we turn down in terms which permit no misunderstanding—and everyone knows we are justified.

Several other forms of advertising may be used, but they are all based on newspaper advertising. Outdoor advertising—billboards—has its place, and the objection to it is more imaginary than real. Radio opens a new field, and we owe it support because of the off-peak load it has built for us. Bill enclosures or imprints, and other direct mail, offer facilities which we have largely neglected. Our show windows may carry either an institutional or a merchandising message, and so may exhibits at various fairs and expositions.

Distincly different from the advertising columns are the news columns of the press. The electric light and power company is a source of news and can make itself a place on the beat slip of every city editor. One of our officers addresses a meeting, his picture and an abstract of his talk appear; an employee bandages an automobile accident victim, another story; our quarterly statement is released, our budget for the coming year is announced, an employee completes 25 years of service—we could go on indefinitely suggesting sources of news.

There should be some one person in our organization to whom the reporters can come. He should be as free to tell them the cause of an interruption as to tell them the text of the president's speech. He should speak with authority and hold such an office that his statements will bear weight in the news. It should be our policy to submit news on its merits, and forget that we are advertisers in the paper. Newspaper training taught this writer that the advertising manager of a newspaper can get news items run only over the dead body of the city editor.

We have trained a corps of public speakers from our employees. Now we put them to work. Schools, church groups, chambers of commerce, luncheon clubs and social groups are hungry for speakers. We have speakers from many different departments of our company, all well qualified to discuss the work of our company and their own work in particular. We make this fact known, and our story is broadcast.

We may go even further than this. Motion pictures present our story in an attractive and universally understood form. We present a playlet which gets our message across, several such have been written. We cooperate with educational institutions, offering them our facilities and our trained men as instructors—perhaps in this way we discover new blood for our organization.

These are some of the avenues open to us in our progress toward better understanding with our customers. First we make it pleasant to do business with us, and then we become better acquainted by telling people about us in many different and very interesting ways.

Our customers are our public. In their opinions lies the very crux of our public relations problem. Their opinions should be favorable toward us—and will be if we follow some such definite plan as this.

THE PLANT

So far we have dealt with variables—human factors. Now we can discuss a fixed and definite thing—the plant. We can only do our best to make the human factors what we think they should be, but we can make the plant what we want it.

We must assume that our plant is in such shape that it will give the continuous service which customers have the right to expect. We must assume that our rates are reasonable and so constructed as to encourage the greatest possible use of electric service. Whether step or block, our rates should be designed to offer incentive to the freer use of service. When electricity cooks, refrigerates, washes, irons, sweeps, lights and does dozens of other tasks in a man's home, he is disposed to feel more kindly toward the company supplying it. We must also assume that our management is ready and able to expand facilities and aid community growth—demand must not be stunted by meager supply.

Buildings may be useful without being ugly, in fact, many commercial buildings are contributions to modern architecture. Office buildings of electric light and power companies are often the outstanding buildings of their communities. But let's look in the back yard. How are the plants and substations?

It is not always possible to have all our plants objects of beauty, but they can be neat. A little grass, some flowers and attractive shrub planting will work wonders with ordinary structures. If the buildings of our neighbors are shabby, so much the better. Our plant will stand out the more prominently. Substations in residential sections are generally given this treatment, but other property is often neglected. Poles and empty cable reels should be stored neatly and kept out of sight if possible.

We are citizens wherever we serve, and, like all good citizens, we should keep our property neat and attractive as a civic duty.

To interest our employees, we inaugurate a contest among the various stations of our system. We supply the garden tools, seeds and plants up to a certain amount. Following our annual inspection, the prize for the winning station is awarded at a dinner of the employees of that station.

Every building in which we have employees flies the company flag every day and the national emblem on holidays. The company flag is merely a banner or pennant bearing our trademark, and serves to call attention to our property—but property must be in such shape that we can be proud of it. The major stations we mark with electric signs.

We make our stations of public interest by naming them for individuals who have rendered conspicuous service—whether they be officers, directors, or employees. This helps to humanize our company in the public mind—John A. Smith Station replaced the "the steam plant," or "Station C."

We invite inspection of our generating plants by school children and groups of grown-ups. Once a year we have open house week, and use the radio and the newspapers to urge people to come and see us. Of course, if a company has a plant at a point of interest, such as Niagara Falls, open house is held every day of the year. Throughout the year we can make definite appointments with specific groups and take them through the plant without upsetting our routine. Guides need not know the technical story; most people are not interested in that, but they must know the story which we want to get across to our customers. Here, again, our employee public speakers come into play.

Distribution and transmission lines should be as unobtrusive as possible. Poles painted green fade into the foliage of residential sections. Steel towers painted aluminum or gray fade into the sky. Of course, in new sections, we run our distribution lines through the back yards, leaving the streets clear. Our public speakers will stress to school children the folly of climbing poles and towers.

Where excavation is necessary to install or repair underground lines, protection signs explain that it is a sign of community growth. When pavement is replaced, it is replaced smoothly.

Transmission lines which parallel the highway in the open country carry signs stating that they are part of our service facilities, thus impressing people with our vast investment in property.

Tree-trimming is the bugaboo of every electric light and power company. Where it cannot be avoided, it must be done by expert foresters, and some of our linemen have had this special training. Getting permission to trim is a difficult job, which should be handled by someone a little more tactful than a line foreman. The job itself, correctly done, will improve the appearance of the tree and make future trimming easier.

Our trucks should all be painted alike and in distinctive colors. Thus they are easily recognized and people are again impressed with the fact that their electric service company amounts to more than a meter in the celler and a cashier behind a grille. Of course, we require every crew to keep its truck in neat, commendable shape, just as we require station employees to take care of their buildings.

Drivers must not be road hogs. We tell them to keep far to the right with slow traffic, and when it is necessary to pass a car, not to crowd the other driver. We warn them against splashing people with water or mud, and tell them not to be too insistent upon taking the right of way. Good will may be built up by making our truck drivers observe the rules of common road courtesy.

These things we may do very definitely with our plant to make it play the part it should in building sound public relations. We must bring it up to the level to which we have sought to raise the other four factors.

CONCLUSION

Visualize a great symphony orchestra. Each member has his part to play; each is in tune with every other performer. The tympani may have only a few notes, while the first violin has a leading part throughout the composition. The conductor lifts his baton and a wonderful harmony of sound comes from the orchestra. Each in tune, each playing his part as it is scored, each contributing to the splendid performance of the orchestra. When the few notes of the tympani are needed, they are played in tune and in time. It is a *cooperative effort.*

Substitute an electric light and power company—a symphony of public service. Let's call the stockholders the percussion, the employees the strings, the plant the wood wind, the customers the brass, and the management the conductor. Each section must be in tune and each must play its part as it is written in the score. A discordant note, a section which fails to keep time, and our symphony is ruined.

H. M. Byllesby Prize Paper

How to Increase the Usefulness of the Accountant in the Public Utility Industry

By CLARON D. BARBER

IN introducing this subject, it is necessary to concede that the past ten years in the utility industry have been an era, preeminently, of engineering development. In most branches of the utility field, particularly the electrical industry, tremendous advances have been made in efficiency and economy of production and distribution in these ten years.

The credit for these achievements, of which interconnection and the growth of super-power systems, larger turbo-generator units, and powdered fuel combustion, have been a few high spots, is due the engineering and operating management. Such spectacular results in one division of the industry have tended deservedly to draw attention away from what might be called the business departments of the industry, including the accounting. Accounting is not a field in which spectacular results are to be expected, but if rapid development has taken place on the technical side of the business, it is well to inquire if the accounting branch has made proportionate progress. It is not an uncommon view among accountants that public utility accounting has not entirely kept up with the rapid pace at which the industry is moving.

Mr. Barber's paper won the third H. M. Byllesby Prize for 1927-1928 awarded last year at the 51st Convention of the N.E.L.A. Mr. Barber is a native of Illinois and a graduate of the State University. He has been with the Commonwealth Edison Company since graduation and at present is Supervisor of Cost Records in the Purchasing Department of that Company.

ALLOWING for the normal development in accounting which results from growth of larger business units, utility accounting has not shown a great deal of basic change during the last decade. The important exceptions to this tendency are the development and adoption of the Uniform Classification of Accounts in 1922, and the growing use of the Baltimore and other improved systems in customer's accounting. While the Uniform Classification of Accounts was officially the work of the National Association of Railway and Utilities Commissioners, the contributions to this classification by the National Electric Light Association and the American Gas Association were very substantial. Apart from these developments, however, the accountant has been pretty well in the background of the industry's advancement. Critics within and without the industry have voiced the rather bald sentiment that utility accounting is in a rut. Without conceding this, it must be admitted that the accountant is not occupying the place of importance or usefulness that he is today in many industries.

What can be done to increase this usefulness? In an industry as large as the public utility industry, in an industry representing over twelve billion dollars of investment and over two billion dollars of operating revenue, in an industry with the most complex business problems constantly before it, there is a vast amount for the accountant to do—there is need for professional accountants of ability and training. There are many individuals in the public utility field possessing these qualifications, but the number is, in comparison with the magnitude of the industry, proportionately small. If the industry were canvassed for accountants holding CPA degrees, or possessing the preliminary training for such degrees, the results would be surprising. Waiving, however, the immediate present, the industry does not seem to be attracting the junior accounting talent, which its future needs warrant. Few young men of recognized accounting training are entering the industry today, whereas thousands of engineering and technical graduates are entering the public utility industry each year. If the supply of junior accountants from the outside is inadequate, there is still the possibility of developing them, through experience, aided by outside training, within the accounting departments of the industry. There are obvious limitations to this method. Further, the case at present seems to be that the chief interest in accounting education and training is not from employees in the accounting departments. All this does not represent a tendency for the best interests of accounting in the industry. The industry must attract and develop its accounting talent. Paradoxical as it may sound, the first step in increasing the usefulness of the accountant to the industry is to increase the accounting talent the industry has available—with an eye to the future.

APART from this, and taking the accountant as he is in the industry, one step which would materially increase his usefulness would be the separation of the auditing, and the strictly accounting function. The general rule in the industry, though there are notable exceptions, is to place all accounting, excepting customers' accounting, under the auditor. In smaller organizations there is much to be said for this set-up, but in large business units it is not in line with good organization practice. The accounting function involves the orderly and systematic recording of business transactions in analyzed form. Its service is primarily to the operating management. The auditing function is concerned with the investigation and verification of accounting records, including the checking of receipts and disbursements, and the certification of the correctness of accounting charges. Its service is primarily to the corporate management.

These two are essentially different functions approached from essentially different points of view. Where the two are superimposed, one function is necessarily overshadowed by the other. As auditing is, from the managerial point of view, the most important, it submerges the accounting, particularly the plant accounting, function. The accounting system tends to be an auditing system. The plant accounts of most utility organizations, while excellent and correct records of expenditure, are not set up nor detailed, so as to be readily subject to analysis. The insufficiency of public utility accounts is attested by the minor weight given to accounting records in rate cases, which is to be regarded as an unfortunate state of affairs, and by the increasing tendency for utility companies to develop more or less complete property or fixed capital records. These latter are in a sense fixed capital accounts analyzed in their complete detail. The only objection to such records is their cost. In most properties more complete plant accounting methods would give most of the advantages of such records at less cost. Now, plant accounting is a function in itself. It should be handled as such, separate from the auditing. This separation is not a new idea—students of business organization have long favored this plan—and it is a set-up of growing popularity in the general business field. Where it is not held desirable to place plant accounting under a separate officer reporting to the vice-president in charge of accounting, the most recommended set-up, and all accounting is left under the auditor's supervision, the plant accounting should be handled by a distinct organization under a special accountant.

BUT whether or not the industry assumes this revised type of organization, its accounting system, the development of better plant accounting, including, where desirable, fixed capital records, offers a means whereby the usefulness of the accountant may be materially increased. The accountant is possessed with the direct business facts of the industry, he can see and analyze its every business phase. He is on the firing line of practical economics, and he is in one of the best positions to prove the efficiency, the integrity, the farsightedness, and the broad consideration for public interest which has characterized modern utility management. Clear, complete, readily understandable and verifiable accounting records and presentations of fact, should be of the greatest value to the industry in meeting investigation or criticism.

Another means of increasing the usefulness of the accountant is through the increased use of cost accounting in the industry. At present, utility cost accounting, with the exception of production cost, is in the initial stage of development. Production costs in both the electric and gas utilities are already on a scientific basis, though the possibilities are by no means exhausted. Distribution costs, and the costs of serving different classes of consumers and different service areas, are still in a rather nebulous state. The application of scientific costing principles to such problems might produce highly interesting results.

A branch of cost study in which much more could be done is the study of investment and material costs. The utility industry is unusual, in that it must regularly increase its investment. Cost analyses of the various items and classes of the materials and labor going into this increased plant would form the basis for better cost control. In purchasing, planning, and construction, there is a real field for cost analysis.

At the present time a good deal of cost work is carried on by various departments other than the accounting. Much of this has been necessary because the information was not available in the accounting department. The accounting departments are passing up an opportunity to be of assistance to the other departments; that is, to the industry as a whole.

A GOOD deal has been said in recent years about simplified accounting practice. The term has, however, been used so loosely and has been so often used as a mere catchword, that it is better used with extreme caution. True, simplified accounting methods are always desirable. They should be the constant aim of the accountant. No doubt there are corners that can be cut in the utility industry. The mechanism of utility accounting for the industry as a whole, however, probably is on a reasonably direct and simple basis.

A field in which there is more to be done is that of standardized accounting practice. Even in individual companies there are necessarily some inconsistencies of practice. For the industry as a whole, however, there is a good deal of variation in the methods of handling certain accounting problems. Chief among these is the handling of depreciation. The diversity of practice in the industry in regard to this item is surprising. Though there has been a great deal of discussion, there has not been the necessary investigation or constructive thought on this subject. At present the apparent inconsistency in meeting depreciation from company to company offers an opportunity for the adverse critic. The same holds true to a lesser extent of many controversial points of accounting. Any standardization should not, however, infringe on the discretionary field of management.

Labor is becoming a more and more expensive item in the industry. In this connection the accountant can be of service to the industry through the application of machine methods to accounting. Much has been done in this line, and, as in the engineering side of the business, it is necessary to put pressure on the manufacturer. It was long after the demand had been voiced for an electric billing machine adapted to customers' billing that a satisfactory one was actually available. But better machines will come, and much of the apparently lifeless routine of accounting can, if given time, be adapted for machine operation by the accountant. It is up to the latter to perfect the systems and methods that will make the next era the machine age in accounting.

In customers' accounting particularly the need for the most accurate methods and systems is a challenge to the accountant. No branch can do more to damage customer relations than the accounting and billing department. Whether through machine methods or improved systems and routines, or other means, the accountant can here perform a real service to the industry in making customers' accounting more exact, more error-proof, and more courteous.

TWO innovations which have entered industry in recent years and which offer certain advantages to the utility business are the thirteen-month year and the "Natural Business Year." The thirteen-month year is a method whereby records and accounts are kept on a basis of thirteen periods of four weeks each instead of on the traditional monthly basis. It offers the great advantage of making accounting data and costs directly comparable from period to period. It puts costing on a really scientific basis. At present it is quite impossible to compare results for a month such as February, which has twenty-three working day, with, say, March, which usually has twenty-seven. Many business firms keep their entire system of accounts and records on this basis.

The "Natural Business Year" is a plan whereby any industry takes as its fiscal year a period which reflects a complete cycle of the industry's activity and which ends during the season of least activity. In the utility industry this would mean a year which would close some time, as would be found best, during the off-peak spring or summer months. Such an accounting period would eliminate much of the strain and extra work which the present December 31 closing entails. It would move the closing period from the holidays and from the winter season of high activity and inventories. It would greatly facilitate taking the annual inventory, and would mean a large saving in costs. It would further reduce the expense and increase the efficiency of the outside audit. Consulting auditing firms are called upon by practically all the industries to make their annual audits on the basis of a year closing December 31. This work must be crowded into two or three months at most, and additional help which is often of less than professional standard must be taken on to meet these demands. At other times their staff of accountants is only partially occupied, and audits could be performed to much greater advantage. Both of these plans would require considerable adaptation of existing business methods in the industry. Both, however, represent a definite attempt to put accounting on a more scientific and useful basis and offer in themselves material advantages to the accountant.

EDUCATION programs are coming to be more and more used in business. In such a complex industry as the public utility industry education has a particular value. If the industry needs trained and more useful accountants, methods of education and training may be used very effectively to this end. Outside training in accounting courses of recognized schools of business, special courses developed in the industry, and extension courses, offers the accountant the general training he requires beyond the job training and the experience he should receive in the course of his work. But the accountants' training should go further—it should familiarize him with engineering and technical problems and with the general principles of the utility industry. It is even desirable that he receive working experience in the other important departments of his company. The accountant, if he is to be of the most value to his organization, must have a broad training as well as a specialized one.

Closely connected with education is that of interchange of ideas and experience within the industry. It is noticeable that accountants are less prone to meet on their common ground than are the technical men. For every article on accounting in the trade press there is a veritable myriad of treatises on engineering subjects. There is too little scientific accounting thought expressed today. This is an undesirable tendency. The accountant should be urged and should undertake on his own initiative to keep in better contact with his associates in the field.

The accountant's work is at present not overly well understood by the other branches of the industry, and hardly at all by the general public. The accountant is himself to blame. He has hidden too long in a veil of mystery engendered by such terms as Debit and Credit, Deferred and Accrued Charges, Net Worth, Net Quick Assets, and the like. At present the old statement that it takes an accountant to understand an accounting report is still too often true. Collectively, the accountants are probably the poorest salesmen in the industry, for they have failed to sell the idea of accounting. The accountant must come out from behind this screen—he must explain the aims and means of accounting and insure the recognition of the rest of the industry. He must explain and simplify his accounting reports so that they will be more readily understandable. A few companies, in their yearbooks, explain in simple terms the items under each heading of the operating statement and the balance sheet. This is a very desirable step, for it gives the stockholders and the public something they can understand. It is human nature that people are suspicious of that which they do not understand. With a larger portion of the public constantly becoming our stockholders, this is important. Another desirable step would be to split the fixed capital account into its main constituents. At present it appears on the published balance sheet as a large and uncompromising figure which does not possess a great deal of meaning. If the facts the accountant presents are to be grasped, he must present them in the simplest, most concise, yet complete manner.

IN conclusion, it may be reiterated there is much that can be done to increase the usefulness of accounting, and proportionately of the accountant in the industry. Since the war there have been radical developments in business methods, and the pace continues to be rapid. In the utility industry, with the tremendous growth that comes as a necessary thing from year to year, with the development of larger and larger systems, with the growth of holding company and intercorporate relationships, the accountant must be prepared to meet more and more complex problems. He must shift and adapt his systems and methods to meet the varying demands of business for information, for control, for analysis. He must, above all, be openminded. In these things and the extent to which he is able to make the contributions that have been indicated as possible, the future usefulness of the account to the industry will be measured.

Behind the Veil

Science, Democracy and Frogs' Legs

By ERNEST GREENWOOD

The fifth of a series of articles portraying, against a social-historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

ONCE more I am faced with the necessity of abandoning an orderly chronology if this series is to be actually what it pretends to be—a portrayal of the evolution of the electrical industry against a social-historic background. Last month I called attention to the statements by Henry Adams concerning the eighteenth century; the appearance of a new variety of mind; and the fact that the whole number of those who, like Franklin, acted as electric conductors of the new forces from nature to men, down to the year 1880 did not exceed a few score, and they were confined to a few towns in Western Europe. America, except for Franklin, "stood outside," and I agreed with Phillips Russell in his designation of the good Benjamin as the "first civilized American." Now I find I must present some sort of a perspective of the eighteenth, the nineteenth and the beginning of the twentieth centuries before proceeding with the discussion of the chief personalities instrumental in the birth and growth of this great public service industry which has brought about such astounding changes in the lives and habits of thought of men. Once more I shall draw heavily on Geoffry Parson's "Stream of History."

WHILE historical analogies are as dangerous as they are tempting, it is interesting to compare the eighteenth century with the twelfth and fifteenth centuries and the nineteenth with the thirteenth and sixteenth. In the first instance, we find similar creative outbursts, and in the second we find the nineteenth century developing ideas and movements originating in the preceding century, just as the thirteenth and sixteenth centuries developed ideas and movements originating in the preceding centuries.

The years 1700 to 1800 provide one of the most interesting periods in history, beginning, as they did, with an atmosphere of classicism and aristocratic charm and ending with the bloody French Revolution which broke every conventional rule of government. This century saw the rise of two new world powers, Russia and Prussia, and the destruction of Poland by partition. Science and invention, under the guiding hand of our "few score scientists," marched quietly forward laying the foundation for a new society and a new manner of life. The industrial revolution in England, beginning before the French political revolution and continuing long afterward, laid down the physical conditions under which the nineteenth century developed.

During the years 1800 to 1900, the application of what had gone before proceeded with such speed that material achievements outran man's ability to organize the society they produced. From the French revolution onward, the welfare of the average citizen became increasingly the center of interest. First civil rights, then political rights and finally education, wages and health became successively the object of governmental concern.

ALESSANDRO VOLTA

THESE two centuries had science and democracy as their basic forces. Of these, science was, perhaps, the more fundamental. The world became smaller and smaller as means of communication and transportation increased. "With the arrival of America, Japan and China on the world scene, the final stage of world history, the Pacific, succeeded to the Atlantic which had, in turn, succeeded to the Mediterranean."

We are told that pure science inspired the intellectual growth of this age and that applied science erected its physical background. Parsons says that "invention can be regarded as no more than applied science, yet it made its early advances independently of science. Printing from moveable type, one of the most important of all inventions, was developed without the aid of science in the modern sense. The mind of the early inventor was mechanical and imaginative, concerned not in general truths but in devices producing specific results. Since then invention has become increasingly related to science, as the acceleration in the process of invention records. The inventions or discoveries during all the centuries prior to 1700 are far less numerous than those of the eighteenth and nineteenth centuries; and the last decade shows a swiftly increasing list of wonders."

Digressing for a moment we note that the Grand Old Man of the light and power industry—the great pioneer who laid the cornerstone of its structure as we know it today—Thomas A. Edison, developed his multitude of inventions much after the manner of these early inventors. He has always been principally concerned in "devices producing specific results" and his methods have always been those designated as trial and error. He had to imagine and he had to create. He had to have patience, vision, industry and persistence. And after he had imagined his lamp, as Berton Braley tells us, "the light of the world was to hang by a thread. Indeed, by the ashes of a thread. Wherefore all the world must be ransacked for a fibre that would glow and continue to glow after it had been burned. The quest for the Golden Fleece was a mere jaunt by comparison to the search for a single filament. Finding a needle in a haystack was as easy as finding Cleopatra's Needle in Central Park when put beside this job of discovering the fibre for the incandescent lamp." But this is a story reserved for a later chapter.

HISTORIANS tell us that after the founding of modern chemistry by the Frenchmen, Lavoisier (1743-1794), the next great step was taken by John Dalton (1766-1844), an Englishman, who conceived "the first scientific hypothesis of the atom as a sub-division of the molecule." But the conception of matter as made up of small separate particles called atoms rather than uniform and continuous, was speculated upon by Democritus, one of the great Greek philosophers, in the fifth century B. C. It was restated by Lucretius. Now our scientists tell us that the atom is not the hard, indestructible thing which Dalton supposed it to be, but itself undergoes transformation.

The eighteenth century saw the invention of the spinning-jenny, the spinning machine, the steam engine, the power loom and the cotton gin. In every case the successful inventor was preceded by earlier men who failed by a narrow margin, and in many cases it is difficult to award final credit to any one name. This is just as true today as it was then. Only recently Mr. Edison's claim to the first practical incandescent lamp has been challenged, although the careful student of history must be convinced that, while the principle of this lamp was not new, Edison not only devised the first practical commercial lamp but he also invented the methods for the generation and distribution of the electrical energy by means of which it could be placed in general use.

In the nineteenth century came the invention of the steam-boat, the steam locomotive introducing the steam railway, the telegraph, the Bessemer steel process, electric light, the telephone, X-Rays and the automobile, while in the early days of the twentieth century came the aeroplane, wireless and radio broadcasting. These inventions fall into three general classes: they increase production in industry by substituting machine power for man power; they accelerate transportation and communication; or they increase health, convenience, comfort and luxury. Some, like the telephone and electric light and power, belong in all three categories. All contribute to the industrial revolution which began in England and which is still spreading around the world.

The industrial revolution which had its beginning at the close of the eighteenth century, had a dark beginning. Villages decayed, cities sprang up and unemployment was chronic. In addition, the English *laissez-faire,* or "let us alone," theory of government and economics permitted a terrible abuse of the factory workers. Men worked from 12 to 14½ hours a day as late as 1825, while children, some of them under five, worked in cotton mills from 5 a.m. to 8 p.m. The British Factory Act of 1833 cut the hours of children under 18 to 12 hours a day. A long line of protective legislation followed until the increased wealth produced by machinery is being increasingly shared with labor. Much of the credit for bringing this about must go to trade unionism.

The story of Great Britain's industrial revolution was repeated later in France, in Germany, in the United States and throughout Europe. Under the genius of Bismarck, the *laissez-faire* policies of England were rejected by Germany and governmental regulation provided the most enlightened aid—for worker and capitalist alike. France has remained a self-subsisting unit balanced between agriculture and industry, with the peasant still a powerful factor. America has reached the stage where agriculture is being passed by manufacture. Industry, itself, has now begun to enter the most advanced nations of the East.

THE arrival of democracy, in a political sense, was "marked by a series of explosions." The American Revolution was primarily a political one to throw off British sovereignty, and the government set up was a republic carefully safeguarded against radical change by a written constitution and a system of checks and balances among the executive, legislative and judicial branches. The whole was modelled after the British and colonial governments with a President substituted for a king but omitting a prime minister.

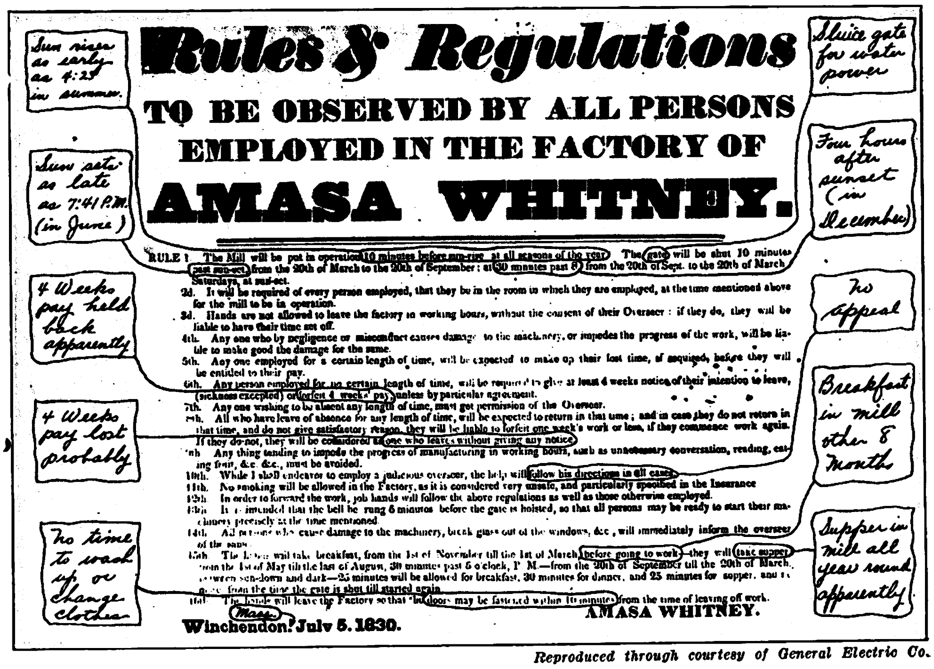
The French Revolution has only been surpassed in bloodshed and terror by the Revolution in Russia. During the succeeding 80 years France was torn between dictatorship or monarchy and radical democracy until the arrival of the third republic in 1870 brought about some semblance of equilibrium. In England, where representative government made slow but steady progress, democracy arrived in the wake of the industrial revolution with a minimum of violence. It has been said that England is the most democratic nation in the world, but this applies only to politics. "Thanks to her responsible cabinet system," says Parsons, "her government is more immediately responsive to popular will than is the American." Both America and France have outstripped England in social democracy. In this country the pioneer spirit which formed American character has kept the United States a land of friendliness and opportunity.

WHILE history records many important experiments in electricity and magnetism between the year 1752, when Franklin announced his kite experiment, and the year 1800, the most outstanding figure of this period from the standpoint of a history of the electrical industry is Alessandro Volta, an Italian natural philosopher and professor at the University of Pavia, and for whom the unit of electrical measurement, the volt, was named. In 1775, he announced his invention of the electrophorus, a sort of perpetual reservoir of electricity, but his crowning effort lies in the discovery of the development of electricity in metallic bodies and the production of the famous "Voltaic Pile." While the last mentioned discovery was made in 1796, it was not announced until the 20th of March, 1800, and then only in a letter to Sir Joseph Banks who communicated it to the Royal Society.

The voltaic pile consisted of an equal number of zinc and copper discs separated by circular plates of cloth, paper or pasteboard soaked in salt water or dilute acid, all being properly connected to develop a large quantity of the "electric fluid." Thus, says Dr. Dickerson in his address at Princeton College, "Volta gave to the world that new manifestation of electricity called Galvanism. In that form this subtle agent is far more manageable than in the form of static electricity; and by the use of galvanic batteries a current of low tension, but of enormously greater power, can be maintained with little difficulty; whereas static electricity is like lightning, and readily leaps and escapes on the surfaces on which it is confined."

"It was Volta who removed our doubtful knowledge," says Faraday in his "Researches." "Such knowledge is the early morning light of every advancing science, and is essential to its development; but the man who is engaged in dispelling that which is deceptive in it, and revealing more clearly that which is true, is as useful in his place and as necessary to the general progress of science as he who first broke through the intellectual darkness and opened a path into knowledge before unknown."

About the time that Volta announced his Voltaic Pile he constructed an electric battery, which was named La Couronne de Tasses (the crown of



Sun rises as early as 4:25 in summer.

Sun sets as late as 7:41 P.M. (in June)

Rules & Regulations

TO BE OBSERVED BY ALL PERSONS EMPLOYED IN THE FACTORY OF

AMASA WHITNEY.

Sluice gate for water power

Four hours after sunset (in December)

RULE 1. The Mill will be put in operation 10 minutes before sun-rise at all seasons of the year. The gate will be shut 10 minutes past sun-set, from the 20th of March to the 20th of September; at 30 minutes past 8 from the 20th of Sept. to the 20th of March. Saturdays, at sun-set.

2d. It will be required of every person employed, that they be in the room in which they are employed, at the time mentioned above for the mill to be in operation.

3d. Hands are not allowed to leave the factory in working hours, without the consent of their Overseer: if they do, they will be liable to have their time set off.

4th. Any one who by negligence or misconduct causes damage to the machinery, or impedes the progress of the work, will be liable to make good the damage for the same.

5th. Any one employed for a certain length of time, will be expected to make up their lost time, if required, before they will be entitled to their pay.

6th. Any person employed for no certain length of time, will be required to give at least 4 weeks notice of their intention to leave, (sickness excepted) or forfeit 4 weeks' pay, unless by particular agreement.

7th. Any one wishing to be absent any length of time, must get permission of the Overseer.

8th. All who have leave of absence for any length of time, will be expected to return in that time; and in case they do not return in that time, and do not give satisfactory reason, they will be liable to forfeit one week's work or less, if they commence work again. If they do not, they will be considered as one who leaves without giving any notice.

9th. Any thing tending to impede the progress of manufacturing in working hours, such as unnecessary conversation, reading, eating fruit, &c. &c., must be avoided.

10th. While I shall endeavor to employ a judicious overseer, the help will follow his directions in all cases.

11th. No smoking will be allowed in the Factory, as it is considered very unsafe, and particularly specified in the Insurance

12th. In order to forward the work, job hands will follow the above regulations as well as those otherwise employed.

13th. It is intended that the bell be rung 5 minutes before the gate is hoisted, so that all persons may be ready to start their machinery precisely at the time mentioned.

14th. All persons who cause damage to the machinery, break glass out of the windows, &c., will immediately inform the overseer of the same.

15th. The hands will take breakfast, from the 1st of November till the 1st of March before going to work—they will take supper from the 1st of May till the last of August, 30 minutes past 5 o'clock, P. M.—from the 20th of September till the 20th of March, between sun-down and dark—25 minutes will be allowed for breakfast, 30 minutes for dinner, and 25 minutes for supper, and no more from the time the gate is shut till started again.

16th. The hands will leave the Factory so that the doors may be fastened within 10 minutes from the time of leaving off work.

cups), and which consisted of a number of cups arranged in a circle, each cup containing a saline liquid and supporting against its edges strips of zinc and silver. At the upper part each zinc strip was connected by a wire to a strip of silver on an adjoining cup, the silver strip of the first cup and the zinc strip of the last cup forming the poles of the battery. It is said that 20 such combinations decomposed water, and that 30 gave a distinct shock.

VOLTA obtained permission from the Italian Government to go to Paris and lecture before the French National Institute. Napoleon, who had seized the reins of government and turned the "rule of the people" into a dictatorship, was a member of the Institute and attended Volta's second lecture, witnessing the decomposition of water. He proposed that a gold medal be struck to commemorate the discovery and that a commission be appointed to repeat all of the experiments on a large scale. Biot, the chairman of the commission, reported on Dec. 11, 1800, and in addition to the gold medal Volta received from Bonaparte the sum of six thousand francs in gold and the Cross of the Legion of Honour. This was the same Bonaparte who laughed at the idea of lighting with gas, calling it "a grand folly."

To Volta has been attributed the fact of having, as early as 1777, entertained the idea of an electric telegraph, although but little appears to be on record in relation to the matter. Fahie quotes a letter of Sir Francis Ronalds, alluding to an autographed manuscript, dated Como, April 15, 1777, and gives its translation by Cesar Cantu, wherein Volta states that he does not doubt the possibility of exploding his electrical pistol at Milan, through wires supported by posts, whenever he discharges a powerful Leyden jar at Como. If this is true then Volta was thinking about the principle of the telegraph long before Morse was born.

It was the experiments of Galvani (Aloysio or Luigi), an Italian physician, which led Volta to the discovery of the Voltaic Pile and of voltaic or galvanic electricity. The manuscript giving the results of these experiments upon the Electricity of Metals is dated Sept. 20, 1786. From papers in the "Bolognese Transactions" it would appear, however, that even before the year 1780 Galvani had made observations upon the muscular contraction of frogs by electrical agency.

It seems that one day his wife happened to be holding a scalpel against the dissected legs and parts of the spine of a frog, which lay in close proximity to the conductor of an electrical machine recently charged by one of his pupils. She noticed that whenever the dissecting knife touched the muscles they were violently convulsed, and, upon communicating the fact to her husband, he repeated and extended the experiment and found it necessary to pass the electric fluid through a metallic substance in order to develop the result originally observed. At first the frogs had been hung upon a copper hook that had been fastened to an iron railing, but he afterward substituted an arc composed of both metals, and with which he could readily produce the same results as were obtainable with an electric machine.

Galvani also made experiments to ascertain the effect of atmospheric electricity upon the nerves of frogs. He connected the latter to rods leading to lightning conductors erected upon the roof of his house, attaching ground wires to the legs, and found that the same convulsions appeared whenever lightning was seen and likewise when heavy storm clouds passed over the house.

THE results of his many interesting observations were first made public during 1791-92. He expressed the belief that the bodies of animals possess a peculiar kind of electricity by which motion is communicated through both nerve and muscle, positive electricity going to the nerve, while negative electricity goes to the muscle, and that the muscles represent the exterior and the nerves the interior of the Leyden jar, the discharge being similarly produced by the metal which communicates with both.

There are a number of other incidents which happened during this period and which are worthy of note before we pass on to the work of Sir Humphry Davy and his experiments with the electric arc. In 1753, Charles Morrison wrote to the *Scots' Magazine* a letter entitled "An Expeditious Method of Conveying Intelligence," wherein he suggested a practical manner of transmitting messages by frictional electricity. Commenting on this letter, Sir David Brewster said, in 1859: "Here we have an electrical telegraph upward of a hundred years old, which at the present day would convey intelligence expeditiously, and we are constrained to admit that C. M. was the inventor of the electric telegraph. . . . Everything done since is only improvement." Yet only a few paragraphs back I indicated that Volta, in 1777, first suggested it.

Looking about a little further, I find that in 1773 Dr. Louis Odier, a well known Swiss physician, wrote to a young lady as follows: "I shall amuse you, perhaps, in telling you that I have in my head certain experiments, by which to enter into conversation with the Emperor of Mogol, or of China, the English, the French, or any other people of Europe, in a way that, without inconveniencing yourself, you may intercommunicate all that you wish, at a distance of four or five thousand leagues in less than half an hour! Will that suffice you for glory? There is nothing more real. Whatever be the course of those experiments, they must necessarily lead to some grand discovery; but I have not the courage to undertake them this winter. What gave me the idea was a word which I heard spoken casually the

Resolution to Mr. Edison

DURING the Fifty-Second Convention of the National Electric Light Association held at Atlantic City, Thursday, June 6, was celebrated as Edison Day. The program for the morning session included addresses by Messrs. P. S. Arkwright, president of the association, Charles L. Edgar, John W. Lieb, Elmer A. Sperry, Thomas N. McCarter, E. W. Rice, Jr., and Berton Braley, all in honor of Mr. Edison.

Mr. Lieb, in the course of his address proposed that a resolution of felicitation and congratulation be forwarded to Mr. Edison at his winter home in Florida. Accordingly the following resolution was sent by telegraph to Fort Meyers on the same date:

RESOLUTION

Whereas, this year marks the fiftieth anniversary of the invention of the practical incandescent lamp by THOMAS ALVA EDISON; and

Whereas, the electric incandescent lamp is the foundation on which the magnificent superstructure of the Electric Light and Power Industry has been reared to undreamed of heights.

Now, therefore, be it RESOLVED by the National Electric Light Association which is in session at its Annual Convention in Atlantic City, N. J., by setting aside Thursday, June 6, as EDISON DAY in celebration of the Golden Jubilee of the incandescent lamp, the Association acknowledges the everlasting debt of gratitude which it owes to the genius and indefatigable industry of Mr. Edison, whose inventive mind envisaged not only the development of the incandescent lamp, but also a complete system of electric generation and distribution necessary to bring the benefits of these, and other epoch-making inventions of Mr. Edison to mankind, so that they have become part of the heritage of the Electric Light and Power Industry;

And, be it further RESOLVED that the National Electric Light Association express to Mr. EDISON its hearty congratulations and felicitations on this memorable occasion, rejoicing that it can pay him this homage and do him honor while he is still in our midst, with his gracious helpmate ever at his side, and while he is still actively living his full life, so replete with accomplishments, enriched with rewards and enjoying the love and esteem of mankind, all of which constitutes a marvelous contribution to the happiness, convenience and comfort of civilization, in which we are privileged to share. And in this Golden Jubilee celebration we join all the world in heralding the genius and great accomplishments of THOMAS ALVA EDISON.

P. S. ARKWRIGHT, *President*
JOHN W. LIEB, *Honorary Chairman of Meeting*
C. L. EDGAR, *Chairman*

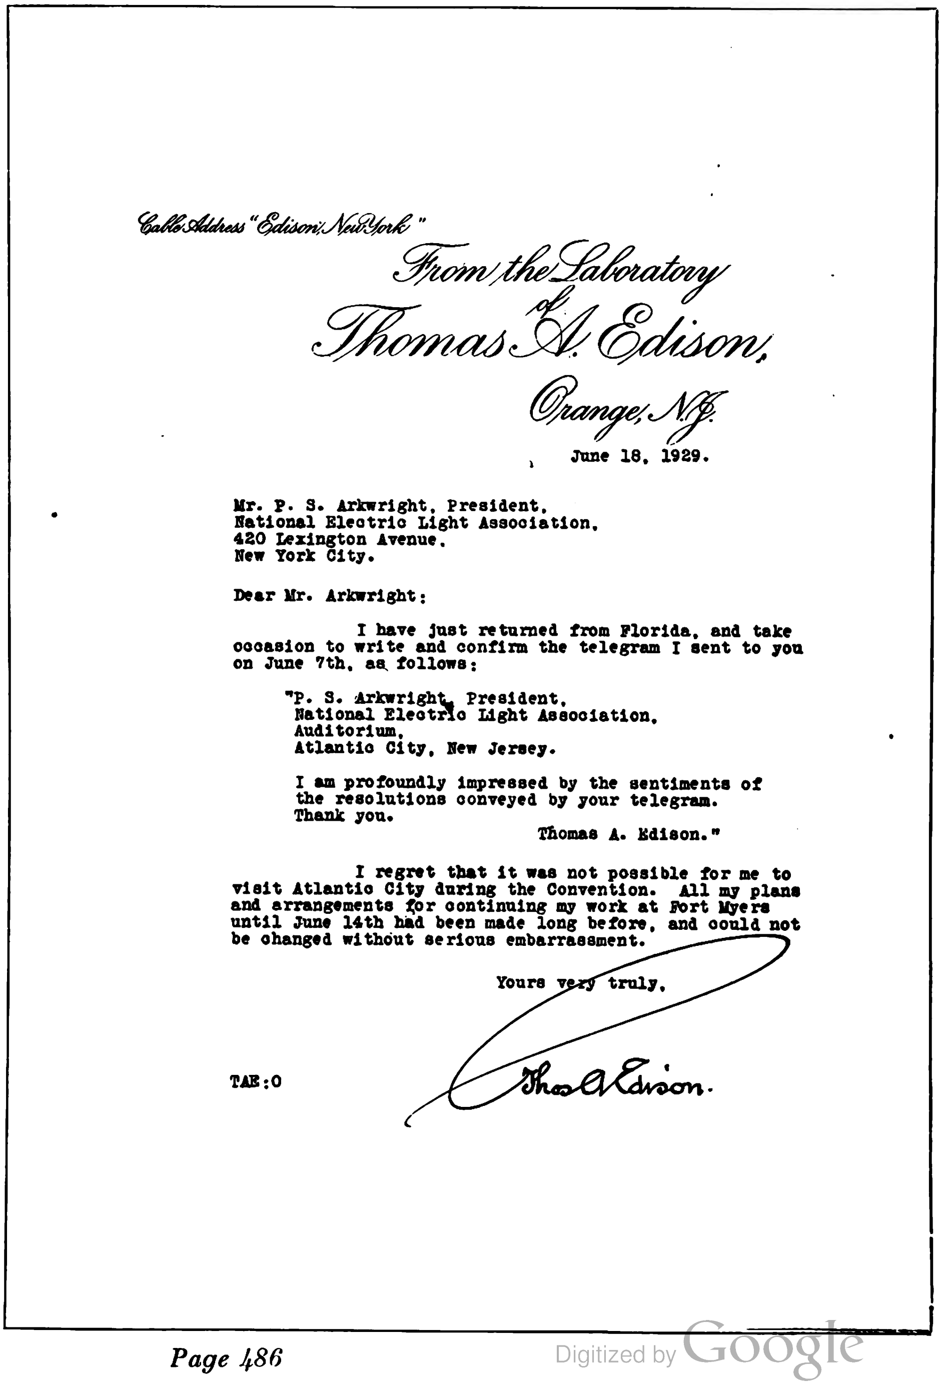
June 6, 1929

Mr. Edison in return wired his appreciation of the resolution, and upon his return to New Jersey addressed a letter of confirmation to Mr. Arkwright, which is reproduced on this page.

The addresses mentioned in the first paragraph have been reproduced by this association in a very handsome book of forty pages whose dedication reads: "On June 6, 1929, a great industry assembled in Convention in Atlantic City, paused to do honor to a distinguished American citizen—Thomas Alva Edison.

"To him who laid the cornerstone of the structure which it represents, this book, containing the words of appreciation spoken on that day, is dedicated by the National Electric Light Association in grateful acknowledgment of its obligation to him and his accomplishments."

A copy of the book has been sent to each member company of the association.



Cable Address "Edison, New York"

From the Laboratory of Thomas A. Edison, Orange, N.J.

June 18, 1929.

Mr. P. S. Arkwright, President,
National Electric Light Association,
420 Lexington Avenue,
New York City.

Dear Mr. Arkwright:

I have just returned from Florida, and take occasion to write and confirm the telegram I sent to you on June 7th, as follows:

"P. S. Arkwright, President,
National Electric Light Association,
Auditorium,
Atlantic City, New Jersey.

I am profoundly impressed by the sentiments of the resolutions conveyed by your telegram. Thank you.

Thomas A. Edison."

I regret that it was not possible for me to visit Atlantic City during the Convention. All my plans and arrangements for continuing my work at Fort Myers until June 14th had been made long before, and could not be changed without serious embarrassment.

Yours very truly,

Thos A Edison.

TAE:O

Contemplating Rural Electrification

By AMPLIFIER

NOT SO VERY long ago a writer on various subjects connected with industry and national economics dealt at some length with what he called the "obligations of the electric power industry." He expressed the opinion that the industry and its employees must be considered in the light of social values. He believes that under existing rate regulatory laws a stable income is guaranteed to the light and power companies and because of this alleged fact interprets the obligation which he sets up as meaning the electrification of rural and other areas that give little promise of high returns; and a variety of other things with which, for the moment, I am not concerned.

ALL of which goes to show how far afield an economist can go when he is concerned only with his own theories and starts dealing with a national institution with which he apparently has no direct contact. Had he written this line (I almost said "wisecrack") 15 years ago, there might have been some semblance of a practical suggestion in it. To write it today, considering what the light and power industry has done in the way of rural electrification—much of it not only not giving promise of high returns but not giving promise of even a decent capital wage—marks the writer as one who knows little, if anything about his subject.

I have before me a booklet entitled "Sixth Annual Report to the Committee on the Relation of Electricity to Agriculture" by Dr. E. A. White, Director of the Committee, and published from its headquarters in Chicago. It is not easy reading and I do not blame the average economist or newspaper writer for not digging into it. On the other hand it is a rather remarkable document and anyone who believes that rural electrification is one of the obligations of the electrical industry, and wishes to advertise that belief, can hardly afford to overlook it if he or she is intellectually honest. Though the report itself may not have been available until recently, the facts which it contains have been available for some time and are worthy of at least a footnote; even in an article or book which sets out to prove that the so-called "power trust" is deliberately avoiding its obligations to society.

What are these facts? Do they show that the light and power industry has no interest in the extension of its lines in any direction except those which will guarantee a definite and satisfactory return on the capital invested or do they show that it is going far and beyond any reasonable effort to serve those whose daily lives are outside urban territory? In other words, has the industry been trying to serve the farmer or has it been sitting back, waiting until its hand might be forced, so to speak, by some governmental order? Let us see.

Not so very long ago it was my good fortune to have a long talk with "Doc" White, who made this report to the committee. He was pleased to say that he thought I was agriculturally-minded, which I accepted as a compliment inasmuch as on a farm I would probably make a good subject for a comic strip. This, however, is not important. What is important is the question as to whether or not the average farmer is electrically-minded and if so, in what direction—the actually physical operation of his farm, or the living conditions in his home, or both.

DOCTOR WHITE believes he is electrically minded, but a perusal of the report leads me to believe that the light and power industry has had to expend considerable effort to make him so. I find, for example, that very largely due to the efforts of the Rural Electric Service Committee of the National Electric Light Association, a Rural Electric Short Course is being given by a number of Agricultural Colleges. The most curious thing about these courses is that they are not directed at the farmer, as one would naturally expect, but at representatives of the light and power industry. In other words, the industry set about to have its own men well grounded on the application of electricity to farm operations so that they, in turn, might discuss the subject with farmers intelligently.

This means—and now I will quote from the report—that "the Rural Service men employed by the light and power companies constitute a most potent group in developing appreciation of the possibilities of electric service in agriculture when considered from the standpoint of the farmer, the company rendering the service, or the manufacturer of equipment. These men, through the distribution of literature, public addresses, prepared articles, equipment demonstrations, and personal contact with individuals, constantly keep new developments before the farmers of their territory." In 1928 there were no less than 385 of these men devoting their time to rural electrification work, and this number is being increased rapidly.

BUT educational effort has not stopped with short courses for light and power representatives. According to the report, an Agricultural Extension Service, working through county and home demonstration agents, will be found in many states. The part which this service may play in the rural electrification movement has been admirably expressed by Professor K. L. Hatch of the University of Wisconsin, who, in the course of an address, said in part:

"Our extension service believes that it is as much a part of its job to educate farmers in the value and use of the electric current as it is to show them the value of better dairy cows or to demonstrate the proper use of lime and fertilizers. Personally, I believe it is of far greater importance. As has already been pointed out, the adoption of better farm practices may easily accrue to the benefit of somebody else, while the adoption and use of the electric current on the farm must result first in improved living conditions on that farm. It may too, at the farmer's own choice, shorten his hours of work and give greater opportunity for leisure and enjoyment to himself and his family."

And so, as nearly as I can make it out, the first step in this so-called rural electrification campaign was to find a way to educate men in its problems, who in turn could educate the farmer to the economic and social benefits of electricity on the farm. This had to be done in the face of what must have seemed, a few years ago, almost insurmountable financial problems. It is all very well to say "electrify the farms," and it is a comparatively easy matter if it can be done as they do it in Ontario—at the expense of the tax-payers, whether they live on farms or in cities—but, when the light and power company sees only a market which will hardly pay the interest on the cost of the copper wire used in reaching the farm without any benevolent government subsidies, it takes not only faith and hope but a very distinct sense of obligation to society to give such projects consideration.

Yet, if one is to believe this somewhat ponderous and exceedingly documented report, the light and power industry has, for years, believed in rural electrification and has been willing to spend money and time and effort to find a practical way to bring it about. It seems to have first thought about it from the standpoint of the farmer. Second, it seems to have thought about it from the standpoint of its own investors and urban consumers. Third, it seems to have thought about it from the standpoint of society in general—national economy, if you please, or national welfare, or anything else you may choose to call the urge to make some sort of a contribution to things as they are in order that they may be a little bit better.

On January 1, 1924, only 175,000 farms in the United States were receiving any sort of electric service. This number has steadily increased until on January 1st, 1929, it had reached 500,000, or slightly less than 10 per cent of the total number of farms in the country. A survey made by the Committee on the Relation of Electricity to Agriculture, covering 31 states, shows that out of 3,911,024 farms 388,791, or 9.9 per cent, are now receiving central station service. No less than 16 of these states have over 10,000 electrified farms. In 17 states more than 10 per cent of the farms are electrified.

It is interesting to note that in all of these 17 states the percentage of farm tenancy—which is 38.6 per cent for the whole United States—is low. In the six West Coast States it ranges from 7.9 per cent in Nevada to 24.4 per cent in Idaho. The average of farm incomes for these six states is very high, reaching the index number of 257 for Nevada as compared to 100 for the United States. Undoubtedly the primary factor behind rural electric development in this group of states has been the irrigation pumping load which insured sufficient use of electric energy to justify the necessary expenditures for line construction and operating equipment.

Turning to the nine states ranging from Pennsylvania to Maine, the report tells us that "so far as can be learned, farmer initiative has been behind the extension of lines in this region." While these states may be considered as the most conservative agricultural region in the United States, the number of farms connected with "high lines" furnishes striking evidence of the value which the farmers place upon electric service. Here, again, we find the percentage of farm tenancy remarkably low, ranging from 3.4 in Maine, to 17.4 per cent in Pennsylvania.

In Ohio and Wisconsin, which represent the Middle West in the 10 per cent or over classification (states where 10 per cent or more of the farms are electrified), it is again found that the percentage of farm tenancy is low. This seems to have some special significance. According to Doctor White "it might be inferred that, while not mutually exclusive, farm tenancy and electricity are not compatible. It may be that electricity will become an important factor contributing to the decrease in tenant farming." In all of these 17 states, either dairying or poultry raising (usually both) is an important agricultural industry and in many of them vegetable growing or fruit raising is also important.

Just how the farmer values different types of electrical equipment is interesting. In attempting to present a national picture, Doctor White finds that electric lights seem to come first in importance. Next are small appliances, among which the electric iron seems to be the most popular. These are followed by washing machines, water systems, electric ranges and cooking appliances, refrigerators, radios, room heaters, water heaters and ironing machines. It is interesting to note, in this national picture, the high percentage of equipment which has to do with the improvement of living conditions in the home. In other words, the farmer is quite as much of a social person as the urban dweller and thinks of his daily life in terms of his home and directs his efforts, first of all, to an improvement of conditions there.

Of course, in specialized types of agriculture, such as dairy farming, poultry raising and vegetable growing, other types of equipment take the place of some of those in this list in importance. For example, more electrical energy is used for irrigation pumping than for all other electrically performed agricultural operations, including household uses.

Providing the farmer with equipment which will use enough current to make the electrification of his farm financially sound has been something of a problem. In the February number of the Bulletin I quoted a friend of mine, who has a completely electrified farm, as saying: "Many farmers who today are prosperous because of electrification combined with scientific methods of farming were as good as bankrupt a few years ago. In order to turn them into profitable customers the light and power company may have acted as banker in the purchase of equipment. This is simply another phase of the financial problem which sometimes may be expensive but which, as I understand it, cannot be reflected in the rates." This is true. The light and power industry must make it possible for the farmer to consume enough kilowatt hours a year to make the investment required to reach him with the power lines worth something, and at the same time it must see to it that the use of the equipment and the electrical energy is profitable to the farmer.

A financial analysis of the effects of the use of electricity on the farm presents a great deal of difficulty. A well known professor, after examining a manuscript of a bulletin on farm management, is reported to have said: "It proves that farming is a business where a man can start with nothing, lose money every year on operation, and die comfortably well off." Which is only another way of saying that until recent times farming profits have come from increment in land values. Today it is evident that profits in farming must come from operation and not in land holdings.

The report sets forth, however, a concrete illustration based on five farms in what is known as the Red Wing Project in Minnesota. In 1924 these farms had a gross revenue of $17,366.41. After deducting operating expenses, making adjustments for stock purchases, deferred bills, etc., these five farms seem to have produced, in the way of net revenue, $6,876.70. In 1925, this increased to $9,769.85; in 1926, to $10,630.70; and in 1927, to $12,446.62, which is an increase over 1924 of 81 per cent. However, no charge was made in these figures for loaned electrical equipment to the value of more than $16,000.00. Figuring interest and depreciation at 12½ per cent on this equipment, and deducting slightly over $2,000 for this item from the 1927 revenues, we can reach the conclusion that the increase over 1924 was something over 50 per cent. Evidently electricity on these five farms paid its way, including the additional cost of an improved standard of living.

Concluding this section of his report, Dr. White says:

"While the above is far from a complete financial analysis of these five farms as going institutions, it does clearly show the possibility of making electric service pay its way, including the additional cost of an improved standard of living.

"Stripping this proposition to its barest fundamentals, in the light of present information it is evident that the extension of electric service to the farm will involve the farmer in additional financial outlay for wiring and equipment as well as the necessity of meeting a monthly bill. Unless he is able to meet these from accumulated capital or present income, some way must be found, through the use of electricity or otherwise, to increase his present net income sufficiently to meet the costs which electric service entails. This is one of the immediate problems facing agriculture."

Getting back to my original thesis,

(*Continued on page 498*)

The Functions of Budgetary Control in Modern Electric Utility Management

A REPORT OF THE BUDGET COMMITTEE, ACCOUNTING NATIONAL SECTION, N. E. L. A., B. S. RODEY, JR., *Chairman*

A BUDGET system, which is thoughtfully designed to meet the needs of management in laying plans for future activities and in watching the results that follow as these plans are carried out, is generally acknowledged as being helpful, if not indispensable, to present day business management.

This is not true because of any magic inherent in the word "budget." But it is true because many of the methods which have been found to be effective in dealing with management problems have been developed around or as a part of budget procedure, and made easier because of the acceptance of budget principles. The electric utility management offers no different problem in this respect than any other business—for the truth is that all kinds of business have their fundamental principles and operations in common. Because of its rapid growth the electrical industry, particularly, is in a position to apply budget principles to the best advantage in maintaining a balance between the ever-expanding functions of the business and in controlling all phases of its operations.

Factors of a Sound Business

To illustrate, let us consider the following topics in relation to budget procedure:

1—Sound organization.
2—Carefully thought out plans for the future.
3—A coordinated effort and understanding among all functions of the business.
4—A follow-up by management to gauge results and apply corrective measures where neecssary.
5—Undertakings in balance with financial resources.
6—Correct thinking.
7—Acquiescence in budgets.
8—Psychological values.
9—The economic cycle.

All these considerations enter into the business conduct of soundly managed and successful enterprises, and whether or not a budget system as such is recognized as being a factor in their success, it is, nevertheless, quite generally true that operation under a well designed budget system provides the management with information and a method of approach, which may be used to instil in the minds of the whole organization, from bottom to top, an enthusiasm and respect for operations in accordance with sound business practice.

The Budget Committee desires to express its acknowledgment to Mr. C. E. Weger, Budget Director, Henry L. Doherty & Company, New York, N. Y., for his special efforts in connection with this report.

Good Organization

Let us consider first what influence budget procedure may have on good personnel organization. In the operation of the budget, one of the first things which must be accomplished is to assign definite operating or managerial responsibilities so that advance estimates may be prepared by each individual for the activities under his direction. There must be no overlapping of responsibility to result in confusion of understanding and lack of control. This means that particular individuals must budget certain results for which they alone will be responsible, and if the organization line-up does not make this clear, then it takes only a short period of operation under the budget to bring out forcibly the need for some rearrangement in the assignment of responsibilities. As a corollary this implies that the accounting procedure must be changed, if necessary, so that it will be possible to obtain from the records an expression of results which will be on a basis comparable with the estimates.

The sound organization of a group of men requires a coordinated effort and a justified confidence in each other's judgment based on their respective abilities made known to all. Accounting practice has done much to this end but even more do budget procedures disclose those executive qualifications of men which by anticipation and control get the most out of a property and insure its perpetuation under any and all conditions.

Good organization of an expending business requires continual changes in assignment and reassignment of responsibilities, a passing down of responsibilities to the younger, growing members of the personnel. Again budget practices play an important role in disclosing to the management that responsibilities are being assumed and carried on with due appreciation and ability.

Planning for the Future

That an exposition of the future possibilities of a business, expressed in the form of budget estimates, is an aid to management will be accepted almost without question. To have thought about and planned constructively for the future is in itself entirely worthwhile. This is particularly true when the detailed estimates which express these possibilities originate with the men who are in charge of each activity. The estimates are likely to prove most valuable when they are compiled from unit costs and unit quantities for both material and labor, so that a comparison with actual results may later be made. Such comparisons will naturally reveal any weakness in the original estimate to the end that subsequent estimates may be revised to approximate more nearly the results possible.

It will be said of many concerns that, owing to the peculiar and unusual conditions under which they operate, advance estimates are of little value in attempting to predetermine results by budget procedure. Of course, it is a fact that fundamental changes take place overnight to alter the basic economic balance. It may be granted in many cases that such changes cannot be foretold in a budget. However, it is a fact, too, that these exceptional special circumstances are in reality more an argument in favor of having a budget than otherwise. For the reason that if a budget plan has been laid out for the future, it requires but a short while to ascertain just what the effect of the new conditions will be, and the coordinating adjustments which may be required to again balance the budget can be worked out with the least loss of time and to the best interests of the company.

Coordination of Effort

It is a plain truth that opportunity is never any greater than the vision of possibilities, the conception of what the future has in store. A plan of taking full advantage of that future is a budget and we can only expect to realize on it if we concretely and broadly go about painting a picture of that vision. No matter how big or how successful a company may be, without having accepted this principle, its prosperity can be increased by adopting it.

The necessity for complete coordination among the various functions of a business will readily be granted. How to obtain this coordination, however, is a matter which still puzzles all and baffles many. A budget procedure can usually be worked out which inherently coordinates the several operating functions so that there will be a balance between the various activities. Since the plans and schedules have been worked out in estimate form on a coordinated basis in the budget, the various departments will automatically be in phase with one another as long as there are no basic changes after the budgeted plans were agreed upon. Further, when a basic change does appear, all departments can take cognizance of it with the least detrimental or the most beneficial effect. Moreover, each department will be bending its efforts consistently in accord with general company policies since these policies will all have been expressed in the budget estimates and be acquiesced in by the management. There can be no question but that each individual operating in accordance with the budget will direct his efforts and the efforts of the men under him into those channels which the budget indicates will be most productive.

Management Follow-Up

Management itself has a particularly important function in taking the initiative in developing plans and policies for future guidance and in providing the requisite personnel and financial resources to achieve its objectives. It is no less a responsibility of management to actively follow from day to day the results that are being secured, in order to see that these plans and policies are carried out, and that the results obtained are satisfactory.

A follow-up is one of the most vital of management considerations. Its value can hardly be overstated, yet there are many individuals in management jobs who do not appreciate this or who have not found the way to effectively carry this part of their management responsibility.

The budget process logically divides itself into three steps. First, the preparation of the original estimate; second, the comparison of the original estimate with the actual results; and third, revision of the estimate for the remainder of any period. It is the second of these steps that provides opportunity for an effective management follow-up through budget procedure.

The benefits which may be obtained from giving close attention to the comparisons of estimate with actual may be to a degree intangible, but they are nevertheless helpful and constructive. In the first place, the individual who knows that his supervisors expect to review periodically the showing which he has made in relation to the estimate which he originally set for himself, will take more interest in his estimates and more pride in his accomplishments than if no such follow-up is contemplated by him. In the second place, by reviewing these comparisons, the management is in a position to know the place in which satisfactory progress is not being made and thus immediate steps may be taken to effect some adjustment or to revise the estimates more nearly in accordance with the realization which is being attained. In the third place, the follow-up comparisons given to management represent the means for intelligently gauging the effectiveness of the individuals under his supervision. The man who takes pride in setting an ambitious estimate for himself and who can, in turn, be relied upon to carry out such an estimate, is a man that management cannot afford to overlook in making selections for advancement. And, on the other hand, eliminations may best be made from those who promise, but who do not perform.

Undertakings in Balance with Financial Resources

It is of great importance that our institutions always remain financially strong and sound. It follows, accordingly, that our undertakings should always give due consideration to the ability of the company to finance the capital requirements of all undertakings planned and on a basis that insures profitable operation over a long period of the future.

Here again the budget supplies a means of coordination to the executive responsible for finance, without which he should reluctantly assume the responsibility.

Most careful planning in advance of cash requirements is necessary to get capital at reasonably low cost, in fact, at times to command it at all. Experience has shown many of us that when we go to our banker for either temporary or permanent capital, his keen interest lies in finding out what our business has done and what its status is today, but the convictions that bring ample credit and cheap money, are convictions as to our ability to continue a satisfactory rate of earnings and control it under any and all conditions. Budget visions of the future fortified by budget comparisons of the past command the respect of capital.

While on the question of the cost or capital, let us not forget the importance of keeping down the cost of creating facilities with which to do business because fixed charges are not only a large item of expense, but they continue to accrue, in time of adversity, to the ruination of many an enterprise. Careful budgeting of construction operations and their follow-up as they progress can play a big part in keeping down fixed charges.

In other words, budget practice is a factor in reducing the fixed charges of our business at both ends. It helps reduce the amount of capital we need and by creating confidence in the minds of our bankers raises our credit and reduces the cost of the lesser amount of capital we do require.

Correct Thinking

A discourse on budgets would be incomplete without a word on the question of correct thinking. Many people who have not held executive positions look upon their daily duties as assignments that unfortunately have to be. In fact, they do not think; they merely do what they are told. We can well afford to spend some time and money to teacn this large group how to think and think correctly. The recognition of budget principles will help do this and will create an increment of increased efficiency well worth while both to the individual and the company of which he is a part. Economics and other business fundamentals enter into every man's daily work and to the extent that he learns to think of them and plan with them he becomes a bigger factor in perfecting his budget processes, enlarging his desires of performance and attaining better results.

"This is an age of realization, an age in which thought, not fortuitous circumstance dominates industry. Thinking can result only in progress. One cannot think himself into ignorance." A budget system compels thinking in terms of established facts, which tends to make the individual a student of his job with the result that more effective work is accomplished in a shorter space of time, with less supervision.

Acquiescence in Budget

It is advisable that the viewpoint of acquiesence rather than approval be taken by the management executives in considering the component parts of a budget prior to their assembly into the consolidated budget. This cooperative spirit of mutual interest is most conducive to continued initiative, permitting at all times the origination of additional considerations by either the departmental executive or the management executive. It also creates the best relationship under which the management can undertake to convince departmental executives of changes in their plans when general overall considerations have to take precedence over departmental desires.

Psychological Values

The psychological approach of both management and men to the job before them when this job has been previously analyzed and covered by a budget, pays dividends. Why? Because these men are all human and under the budget they realize that management, on whom they are dependent for progress, is cognizant of their ability to size up the problem before them and also of their comparative performance. All men have pride, ambition and capacity. They will not jointly with someone else belittle their own ability, and consequently, their budget estimate which is to be acquiesced in will be at least a creditable performance. Likewise, they will make every effort to perform in accordance with their own appraisal. This also is all equally applicable to the human qualifications of the management executive who has put his stamp of acquiescence on the budget of the business for which he is responsible to his board of directors.

Budget principles and budget procedure make this appeal to pride in our work, to a much greater extent than any other established business processes.

Courage is a vital part of success. It is a product of the inner-self and comes out as we get confidence in our ability to accomplish the things that we set ourselves to do. That necessary courage is further strengthened when we set ourselves to do with a knowledge of a coordination with our superiors both as to acquiescence in the goal we are striving for and a review of the progress we are making toward it.

The Economic Cycle

Economists are very much agreed that the economic cycle of the future will have a much narrower range than in the past. However, the reasons assigned, in many cases, seem to be only intermediate results of the real basic reasons. One of these basic reasons, and not the least important, is the adoption by business of budget principles and procedure through which to better control its present and future. There will always be periods of greater and periods of lesser prosperity, but the probability that such abnormal swings as were shown by the panic periods of the past could be forgotten if each unit of business that makes the economic cycle were under control within itself.

Conclusion

There are no written instructions or any uniformity of practice which may be used as unfailing guides for all companies. Differences in organization plans and in personnel make it impractical even for those engaged in the same industry to agree upon anything more than the fundamental principles. The reports of the Budget Committee in 1922, 1923, 1924 and 1925, may still be used as reliable sources of information concerning these general principles and the common practice of electric utility companies.

There is, however, one essential consideration in the administration of the budget in any business. Each individual and each function of the business should be responsible for budgeting its own results. Budgeting is not a function of one department or bureau, but it is the concern of all who contribute to the common result. A triumph for budgeting is a victory won by sound thinking and coordinated effort. But in the last analysis it is the attitude of the executive management which will very largely determine the size of the victory, because management alone is in a position to weigh the efforts of all departments and to pass judgment upon the results attained. If the management gives close personal attention to the budget and is entirely in sympathy with it there will no doubt result a coordination of effort, which will go a long way toward the predetermination of future results.

Thomas Alva Edison

An Appreciation

On June 6th, 1929, a great industry, assembled in Convention in Atlantic City, paused to do honor to a distinguished American citizen—Thomas Alva Edison. ▲ ▲ ▲

To him who laid the cornerstone of the structure which it represents, this book, containing the words of appreciation spoken on that day, is dedicated by the National Electric Light Association in grateful acknowledgment of its obligation to him and his accomplishments.

The Association has published in a handsome forty-page book the addresses made on the Edison Day program, June 6, of the National Electric Light Association. The dedication and table of contents are reproduced herewith. The book will be sold by the Association at 45 cents per copy in quantities up to 100. For greater quantities the price will be 40 cents per copy.

Substation Control Systems

A Report of the Substations Subcommittee of the Electrical Apparatus Committee, Engineering National Section, N. E. L. A.

By G. R. Milne

NOTE: The following article has been released by the Electrical Apparatus Committee in compliance with its policy of procuring early publication in the N. E. L. A. BULLETIN of reports which, on account of their brevity, can find space in this medium.

The committee believes that these brief reports will be found equally useful, in their appropriate degree, with the more elaborate serial reports.

All of the aspects of substation design are of current interest. The design of control systems, the measures taken to insure their integrity, their sources of supply, and the loads and extraneous attachments on the control bus are discussed in this report.

A STUDY has been made of the Substation Control Systems of member companies with a view of obtaining the trend in the types of circuit breaker control circuits and the source of supply for control of breakers. This study has been conducted under the direction of the Substations Subcommittee of the Electrical Apparatus Committee, Engineering National Section.

The types of control circuits have been classified with respect to the degree of supervision of the control wiring and whether breakers are trip-free under fault conditions.

The trend in control bus supply was studied to determine the number and source, the type of control bus, fusing practice and the control bus load.

Definitions

Due to the apparent difference in opinion on the meaning of the terms "trip-free" and "supervision," it seems desirable to give a clear definition of these terms as a basis of understanding of the control circuit classification in this report.

Supervision

Supervision in the sense used here is intended to apply to a circuit so designed that a break or poor contact at any point in the circuit, up to and including relay and control switch studs, will be indicated by the indicating lamps or some other warning signal. The method of supervising relay studs is illustrated by Fig. 8.

Electrically Trip-Free

An electrically operated circuit breaker is electrically trip-free when it is free to trip on any abnormal condition provided for, regardless of the position of the control switch, and will not reclose even though the control switch remains in the closing position. In this article where trip-free features are discussed, reference is made to electrically trip-free breakers.

Mechanically Trip-Free

A manually or electrically operated circuit breaker is mechanically trip-free when it is free to trip on any abnormal condition provided for, regardless of the position of the actuating of the closing mechanism by any means contemplated in the design of the breaker.

Switch Control Systems

From the replies received the following deductions are made. In regard to control circuits, most companies are not using supervision in the sense indicated above, the light indicating only the position of the breaker, the continuity of the fuses, and in some cases the continuity of the trip coil. Such important circuits as the trip wires of relays are teed to the supervised circuit.

Practically all companies reporting are using trip-free relays in the breaker closing circuits of their most modern stations.

The control circuits submitted have been divided into four general types based on degree of supervision and trip-free characteristics.

Type I.	Non-trip-free with no supervision.
Type II.	Trip-free with no supervision.
Type III.	Non-trip-free with partial supervision.
Type IV.	Trip-free with complete supervision of the trip circuit in closed and tripped position of the main breaker.

Twenty per cent of the companies reporting had Type I control systems which have no supervision of the operating equipment or wiring, the indicating lamps showing the position of the breaker only. This is shown in Fig. 1. No trip-free device is used, and it is possible to hold the breaker closed against a short circuit by keeping the closing coil energized.

Fifty per cent reported having Type II, which is trip-free, but which provides no supervision of the operating circuits of the breaker. Fig. 2 shows a typical solenoid type of breaker using a common wire to the indicating lamps, energized by a pallet at the breaker, one lamp being connected to the positive and one to the negative side of the control. While trip-free, this circuit will permit

SUPERVISION

DEFINITION:- A CIRCUIT IS SUPERVISED IF IT IS SO DESIGNED THAT A BREAK OR POOR CONTACT AT ANY POINT IN THE CIRCUIT WILL BE INDICATED BY FAILURE OF THE INDICATING LAMPS, OR SOME OTHER WARNING SIGNAL.

LOOP CONNECTION:- TO GUARD AGAINST LOOSE MECHANICAL CONNECTIONS, CIRCUIT WIRES SHOULD BE CARRIED DIRECT TO STUD CONNECTIONS OF RELAYS AND PALLETS AND SEPARATLY CONNECTED WITH LUGS OR CRIMP WASHERS SO THAT POOR CONTACT AT VITAL POINTS ON TRIP CIRCUIT WILL BE INDICATED.

pumping if the control handle is held closed. Fig. 3 shows a similar arrangement for a motor-operated breaker in which the motor action gives a time element of delay which makes the circuit semi-trip-free. Fig. 4 shows a modification of this circuit which gives supervision of the trip circuit.

Twenty per cent reported using Type III circuit which is not trip-free, but which gives partial supervision of the trip coil and pallet as shown in Fig. 5. The modification of this circuit, shown in Fig. 6, includes a trip-free relay and complete supervision of the tripping circuit in the closed position of the breaker only.

The remaining 10 per cent are using modifications of Type IV, which includes those arrangements which afford full supervision of the tripping circuit in both the open and closed positions, of which Fig. 7 is typical. This arrangement includes some supervision of the closing circuit, though it seems to be the general opinion that this is more complicated than is warranted.

Fig. 12
Direct Current Load

CONTROL SUPPLY SYSTEMS FOR A. C. SUBSTATIONS

Source of Supply

The control bus load is furnished by a combination of a motor-generator set and a battery. The battery is connected solidly to the control bus except for fuses and is continuously floated on the motor-generator set. The motor-generator set furnishes the continuous load such as indicating lamps and holding coils and the floating or charging current to the battery. Owing to the small capacity and drooping characteristic of the motor-generator set the large momentary current demands such as are required to close the larger circuit breakers are derived almost wholly from the battery.

The power supply for the motor-generator set in practically all cases was the house feeder. In five cases an extra bank was available in an emergency and in one instance a company reported an arrangement whereby one bank is fed from the primary and one from the secondary of the main station transformer. This refers particularly to 125 volt control usually involving comparatively large currents for the closing of circuit breakers and frequently some capacity to care for emergency lighting requirements.

The one exception to the above is the use of a 48 volt battery charged by a bulb rectifier, in a non-attended automatic substation. For 24 or 48 volt control which is commonly used when the service is light such as tripping only of circuit breakers or for the operation of supervisory control equipment, it is customary to float the battery on a rectifier usually of the bulb type regulating the floating and charging current by means of a rheostat.

Two companies reported batteries as the main source of the D.C. control in some of their stations; the batteries being charged daily or as required by the service imposed on them. The motor-generator sets usually varied from 1.0 to 10 kw. Where the larger size of motor-generator sets are used, undoubtedly a large floating load exists. For instance, the use of a 10 kw. set with the 120 ampere-hour battery would mean that it would be necessary to have a connected continuous load of 55 to 65 amperes in order to utilize the full capacity of the generator at any time. A 120 ampere-hour battery at the 8 hour rate floated on a 10 kw. generator under normal floating conditions and supplying a load of 20 indicating lamps will be operating at a load of only 3 per cent. The average size of battery for substations reported was 60 cell, 44 ampere-hours (8 hours), although use of 60, 80 and 120 ampere-hour batteries was also reported.

It has been determined that the 140 volt generators which have been designed particularly for floating 125 volt control batteries are capable of stable operation at the floating voltage of 129 at loads as low as 15 per cent of full rated load. Also it is not considered necessary to include any more than 25 to 50 per cent of the normal charge rate of the battery in the generator capacity in addition to the continuous load requirements. It is felt that the application of the proper size motor-generator set is of extreme importance if the maximum of life and reliability are to be obtained from the control battery.

Although some companies report that the battery is periodically given an overcharge to take care of unequal charging of the cells or a greater drain on the battery than which is replaced by the trickle charge, for the past several years the instructions issued by the storage battery manufacturers have included a statement that regular equalizing charges are not required with a properly floated battery. The necessity for equalizing charges with a properly floated battery will occur very rarely. Excessive charging of the battery has a marked effect on its length of service.

The above information has been tabulated and is shown in the accompanying tables, Fig. 9, 10, 11 and 12.

Control Bus

General tendency is to provide a single control bus to which all circuits are connected, but some cases were reported where two control buses were used, one located at the control board and one at the circuit breaker. This is especially true where breakers requiring heavy closing current are located at some distance from the board control bus and it would be uneconomical to run a separate heavy feed for each breaker. In a few cases of large substations, control bus circuits were arranged in two or three groups which were tied together through fused connections.

Fusing Practice

Circuit connections to the control bus as reported are made by means of fused knife switches except on the D.C. end of motor-generator sets, which are provided with an automatic switch, usually an air-circuit breaker, arranged to open on reverse energy or on failure of supply on the A.C. end of the set.

No general practice regarding size of fuses is obtainable from replies submitted. It is customary to fuse the main battery leads with a fuse rated the same as the one-minute rating of the battery down to 1.75 volts per cell. The purpose of these fuses is only for the protection of the wiring, as the battery itself cannot be harmed in any other way than to become discharged, even by a direct short circuit. Generally, provision is made in fusing for the possibility of closing two oil circuit breakers simultaneously.

Load on Control Bus

The continuous load on the control bus is relatively small consisting mainly of signal lamps. No use of A.C. supply for signal lamps is reported. In some cases additional load consisting of recording instruments, certain kinds of relays and in automatic substations M-G set control and supervisory control equipment are added.

Some companies believe it advisable to install a battery of sufficient capacity to furnish the maximum load requirement for a 12-hour period for all manually controlled stations, and for all automatic stations to provide for 24-hour protection, or to furnish the required load for the maximum time between inspection in non-attended automatic stations, particularly when located in isolated sections.

Intermittent load consists of opening and closing oil circuit breakers, emergency station lights, relays, alarm bells and automatic reclosing devices. As stated above, the closing current of two oil circuit breakers added to the normal load is generally considered the maximum intermittent load to be provided for, although some feel that there is a remote possibility of closing more than one breaker simultaneously where less than five breakers are installed.

Tripping currents are not considered a governing factor being relatively much smaller than closing currents except in the case of certain motor-operated breakers.

Certain emergency station lights are usually wired to an automatic or hand-operated switch arranged for connection to the control bus in case of failure of the A.C. supply.

Some companies report operating a few lights in vital locations from the control bus at all times.

Summary of Practice

The general tendency is to use "trip-free" relays in the circuit breaker closing circuits.

In regard to control circuits, the general tendency is not to supervise, as defined, either closing or tripping circuits in either the closed or tripped position of the circuit breaker.

The general tendency is to have one A.C. source, the house feeder, as the supply for the control system. A single D.C. control bus is supplied from a motor-generator set and storage battery, the battery floating on the motor-generator at all times.

The companies reporting showed a tendency toward the use of 125 volts as the voltage of the D.C. control bus.

Automobile Accident Classification

An Aid in the Prevention of Traffic Accidents

A REPORT OF THE ACCIDENT PREVENTION COMMITTEE SUBCOMMITTEE ON AUTOMOBILE ACCIDENTS, W. E. SANFORD, *Chairman*

EDITOR'S NOTE: Most electricity supply companies operate large fleets of automotive vehicles consisting of heavy and light trucks, passenger vehicles and very often motorcycles or motorcycle side cars. The safe operation of these fleets requires the same consideration of the hazards of roadway traffic that is devoted to the hazards that are peculiar to our business. In a sense, it is of special importance that electrical utilities should give this subject consideration, since in the nature of things, their vehicles are on the highways only in the fulfillment of various missions devoted to the public service and it is therefore especially appropriate that they should not be involved in any avoidable traffic accidents.

The following report has been prepared by a subcommittee on Automobile Accidents of the Accident Prevention Committee of the N. E. L. A., under the chairmanship of Mr. W. E. Sanford; this committee in preparing its report acted jointly with members of the subcommittee on Automobile Accidents of the Accident Prevention Committee of the Metropolitan New York Section, N. E. L. A.

THE primary objective of our work is the prevention of accidents, and if we admit that the human element is responsible for the greater part of the automobile accidents, it is evident that we must concentrate on educating *our* drivers, endeavoring before serious results can materialize to eliminate those who refuse to profit by the education.

While it is impossible to prophesy the possible results of an accident if the conditions were slightly different, yet it should be possible to judge a case according to fixed rules so as to set up a danger signal on the records when an unnecessary chance is taken.

The Classification Chart proposed and reproduced herewith, provides a standard form to accomplish the following purposes:

1st. By "Degree of Hazard" to indicate an average severity rate which would show the trend of the experience of the fleet of the individual organization, and provide a fairly accurate method of comparing the experience of any fleets, due allowance to be made for different traffic conditions encountered in the territory covered by the fleets under comparison.

2nd. By "Degree of Hazard," "Responsibility," and "Cause" classifications, to provide a means of tabulating the records of the individual operators so that the operator's record card will give a clear-cut story of the individual accident experience.

AUTOMOBILE ACCIDENT CLASSIFICATION CHART

DEGREE OF HAZARD

"A"—MAJOR HAZARD
"B"—MINOR HAZARD

RESPONSIBILITY

1—COMPANY DRIVER
2—OTHER DRIVER
3—PEDESTRIAN
4—THIRD PARTY
5—UNCLASSIFIED

NOTE: Responsibility Classification to be followed by a question mark when some contributory responsibility is indicated by the facts. As — "A" — R2? C2 (a). "A" = Degree of Hazard; R2 = Responsibility, Other Driver; ? = Some Divided Responsibility; C2 (a) = Cause; Failure to grant right of way.

CAUSES

1—POOR JUDGMENT

a) Following or Passing too Closely
b) Too Fast for Conditions
c) Backing Up
d) Leaving Curb
e) Inattentive Driving
f) Passing Turning or Backing Vehicles

2—VIOLATION OF TRAFFIC REGULATIONS

a) Failure to Grant Right of Way
b) Improper Turn
c) Overtaking on Wrong Side
d) Driving on Wrong Side of Roadway.
e) Disregard of Traffic Signals or Lights
f) Pulling Out of Line
g) Improper Parking
h) Reckless Driving
i) Intoxication

3—DEFECT IN MECHANISM OR EQUIPMENT

a) Brakes
b) Steering Gear
c) Faulty Lights
d) Other Defects

4—UNCLASSIFIED

a) Inexperienced
b) Physically or Mentally Unfit
c) Avoiding Pedestrian
d) Not Connected with Driving Ability

NOTE: See Definitions

NOTES AND DEFINITIONS TO AUTOMOBILE ACCIDENT CLASSICATION CHART

DEGREE OF HAZARD

"A" Major Hazard.
"B" Minor Hazard.

Class "A" to apply to all accidents indicating a potential serious hazard due to any of the following:

1. Loss of control due to any cause.
2. Speeds in excess of a safe rate for conditions as indicated by report (judgment to be based on reported speed qualified by mechanical damage and other evidence).
3. Any contact with pedestrians.
4. Carelessness or reckless driving indicated by the evidence.

Class "B" to include all accidents not covered by Class "A".

NOTE: The fact that property damage or personal injury claims are made should not prejudice the case against the driver when such claims are clearly unjustified. In considering mechanical damages, judgment should be based on the forces involved rather than on the cost of repairs.

It is thought that attempting more

than two grades of classification would only complicate the work without any particular advantage being gained. In the classification of accidents the value lies more in obtaining a fair average than in expecting a one-hundred per cent perfection in each individual case. It is therefore recommended that grades "A" and "B" be adopted. Grades to be determined by consideration of driver's report and all other available evidence.

RESPONSIBILITY

In some cases, the responsibility is very clear cut. In others, while the evidence may point definitely to one party as responsible, there is often evidence that there may have been contributory negligence on the part of others. To obtain an accurate record of a driver's performance, this condition should be indicated. Where two or three accidents have been experienced by a driver, even though charged to "Others Responsible," they should be carefully considered when this is apparent. (See specimen driver's record card.)

CAUSES

(More than one cause should be indicated if apparent)

It is important that Basic Causes be shown, rather than resultants such as "Skidding," "Loss of Control," etc., which are not causes of accidents.

To clarify the meanings, the various causes have been grouped under explanatory headings.

POOR JUDGMENT

1 (a) "Following or Passing Too Closely" is intended to cover cases of striking vehicle ahead at a sudden stop, striking stationary objects or vehicles or even a moving vehicle where other negligence is not apparent.

1 (b) "Too Fast for Conditions"—Closely related to 1 (a), is often the cause of skidding or other loss of control.

1 (c) "Backing Up"—Cases where driver does not assure himself that way is clear before backing.

1 (d) "Leaving Curb"—similar to 1 (c).

1 (e) "Inattentive Driving"—this condition must be judged by the evidence available, and covers day-dreaming, allowing attention to be diverted, etc.

1 (f) "Passing Turning or Backing Vehicles"—covers cases of trying to slip by a vehicle making a turn when the purpose of the other driver is evident. Where the turning or backing driver has not given fair warning and assured himself of a clear field, this would be charged to 1 (c) "Backing Up," 2 (b) "Improper Turn," etc.

VIOLATION OF TRAFFIC REGULATIONS

Covers violation of any local ordinance or State law.

2 (a) "Failure to Grant Right of Way"—primarily at an intersection; precedence in relation to intersection, speed and general conditions should be considered.

Name	Department	Date of Birth	Date Employed
John Jones	Storeroom	3-6-04	1-15-27

Driving experience at date of employment, 3 yrs.

Reference Number or Date of Accident	Remarks	Classification		
		Degree	Respon.	Cause
4-1-27	Struck elevated pillar to avoid taxi cutting out of line....	"A"	2(?)	2(f)
5-3-27	Struck in rear while standing in traffic	"B"	2	1(a)
7-1-28	Struck "L" structure to avoid pedestrian	"A"	3	4(c)
11-19-28	Skidded and struck parked car	"A"	1	1(b)

Specimen Driver's Record Card (4x6")

2 (b) "Improper Turn"—turning right or left at intersection contrary to traffic rules.

2 (c) "Overtaking on Wrong Side"—attempting to pass to the right of a vehicle ahead.

2 (d) "Driving on Wrong Side of Roadway"—driving on left side of a two-way traffic lane, on left side of center line in overtaking when opposing traffic is heavy.

2 (e) "Disregard of Traffic Signal or Lights"—disregard of officer, dummy signal, or automatic lights.

2 (f) "Pulling Out of Line"—cutting in and out of congested traffic lines; crowding other vehicle when cutting in.

2 (g) "Improper Parking"—Facing wrong way, too far from curb, failure to block or lock on grades, too near intersection, driveway or fire hydrant; etc.

2 (h) "Reckless Driving"—Habitual chance taking, even though excessive speed is not indicated.

2 (i) "Intoxication"—When driving is a violation of law in most States, but can be used in case of Pedestrian or Third Party as cause of accident if indicated.

DEFECT IN MECHANISM OR EQUIPMENT

Items need little definition except 3 (c) "Improper Lights" which covers—lack of lights, improperly placed, or glaring lights.

UNCLASSIFIED

4 (a) "Inexperienced"—an operator who has had little road practice.

4 (b) "Physically and Mentally Unfit"—Physically unfit to cover cases of poor eyesight, permanent defects, inherent weakness, exhaustion due to long tour of duty; etc. Mentally unfit to cover cases where severe nerve strain, family worries, etc., can be substantiated.

4 (c) "Avoiding Pedestrian"—striking other vehicles or obstruction in avoiding children or others on the highway.

4 (d) "Not Connected with Driving Ability"—To cover accidents in which the operator's driving ability is not involved.

EXAMPLES

1. Car "A" travelling south at 15 m.p.h., 3 feet from west curb; weather clear; daylight; street wide and good condition; little traffic, Car "B" travelling north at 25 m.p.h., crosses over and strikes Car "A" head on. "A" is Company Car. Classification R2—C1(e).
2. Car "A" travelling south on main thoroughfare at 20 m.p.h. is struck between front and rear wheels by Car "B" travelling east at 20 or more m.p.h.; weather, light and street conditions good. Car "A" apparently reached intersection first but some doubt exists, and Company driver should play safe and drive 60% to 40% for others. Classification is R1?—C2(a). The question mark after R1 on the operator's record card indicates that some doubt exists, and is favorable to his record.

Contemplating Rural Electrification

(Continued from page 488)

which was, if I may be permitted to put it in words of one syllable, that folks who call upon the light and power industry to discharge its obligation to society by electrifying all the farms in the United States don't know what they are talking about, I wish to submit that the industry has been doing everything that it could possibly think of to this end for years. It has been educating its own people and it has been doing its best to inform the farmer. It has conducted all sorts of experimental enterprises to prove to the farmer that electrification is to his economic benefit and to prove to the light and power companies that the agricultural load can be made to pay in spite of the high cost of reaching the farmer and in spite of the financial help which they may be called upon to give him in the purchase of equipment until that equipment pays for itself. It has brought the situation to a point where rural electrification is proven to be a sound enterprise, except in a few unusual areas. It is with considerable confidence that I say that this movement will go forward with increasing speed, and our doctrinaires need give themselves no concern about the matter.

Papers Submitted in Prize Awards Contest Now Available to Members

THE BULLETIN publishes below and on succeeding pages a partial list of papers entered in the 1928-1929 competition for the various prize awards offered annually under the auspices of the Association. Remaining papers will be listed in the next issue of the BULLETIN.

The Association will be glad to loan any of the papers listed upon application to the Secretary, National Electric Light Association, 420 Lexington Avenue, New York, N. Y. (With the exception of the prize winning papers. These are to be published during the year in the N. E. L. A. BULLETIN.)

Such requests for loans will be filled in the order of receipt.

The listing of papers according to the prizes for which they were submitted, or by groups as commercial, accounting, etc., was considered but this plan was given up as impractical, for the reason that many of the papers defied such arbitrary classification due to their wide scope, and a complete analytical classification would have made too great a demand on space.

This collection of papers represents not only the best efforts of many of the intelligent and ambitious young men and women of the industry but also the seasoned reflections, or case histories of the solution of problems of importance to the industry at large, by those who have already won positions of distinction and authority.

The reception accorded the publication last year of the 1927-1928 list of papers is responsible for the publishing of this year's list. Several hundred loans were made of last year's papers and occasional requests for them are still coming to Headquarters.

An announcement of the prize awards to be offered for 1929-1930 will appear in an early issue of the N. E. L. A. BULLETIN.

PRIZE WINNING PAPERS

Prize winning papers are to be published during the year in the N. E. L. A. BULLETIN *and will not be loaned in advance of publication.*

Doherty Prize

Everett W. Vilett	Public Service Elec. & Gas Co., Newark, N. J.	"Investment Merit of the Electric Utility Industry."

Light's Golden Jubilee

THE progress of the plans for the celebration of Light's Golden Jubilee indicates that this world-wide demonstration of appreciation and affection for Mr. Edison will far surpass that of any popular tribute ever rendered to any person.

In proof of the public interest in the celebration are the many newspaper and magazine articles being published, the desire to participate expressed by all types of organizations from governments to civic organizations, and the communications from thousands of individuals giving whole hearted endorsement. Another indication is the fact the special Jubilee postage stamp has been purchased eagerly wherever it has been placed on sale, and an additional one hundred and fifty millions has been authorized by the Post Office Department, making a total of three hundred and thirty million to be engraved.

Activities in New England

In New England a widespread observance of Light's Golden Jubilee will take place. Events will move to a fitting climax on the night of October 21, when the dedication of the Edison Museum and Edison School of Technology at Dearborn, Mich., will attract the attention of the entire civilized world.

The Associated Industries of Massachusetts, has started a cooperative program with the Edison Electric Illuminating Company of Boston to feature the jubilee at the October exposition of the former organization, where interesting displays of Edisonia will be made in connection with exhibits of Massachusetts products. The Boston Chamber of Commerce has indicated its interest in the jubilee and it is expected that a regular luncheon meeting will be held in October at which a distinguished representative of the electrical industry will speak to 500 assembled members and guests on the significance of Edison's works and achievements.

The cooperation of many other boards of trade, chambers of commerce, etc., is well assured throughout many parts of New England. The jubilee movement impetus has thus far been apparent chiefly in the light and power industry, on account of the naturally early interest of this industry in the matter.

Activities in the Central States

The states of the central part of the country, from Canada to the Gulf of Mexico, are manifesting an enthusiastic interest in the celebration of Light's Golden Jubilee. A characteristic of many of the plans and proposals under consideration for the public commemoration of the half century birthday of the incandescent lamp is the acceptance of no small partial responsibility for the success of the celebration by other organizations—business, civic and social service—than the electric utilities alone.

To the first suggestions made at the beginning of the movement last spring, and to the later plans for their participation in the affair, there have come wholehearted responses from municipal departments, from local chambers of commerce and business men's organizations, from service groups, such as Rotary, Kiwanis and Lions clubs, from bodies concerned and associated with the primary and high schools, boards of education and parent-teacher associations, and from many other bodies of civic or semi-public character.

Pacific Coast Activities

While plans for participation in Light's Golden Jubilee celebration have not definitely been formulated, each community on the Pacific coast is entering into the spirit of the occasion and will take its place along with the rest of the nation in commemorating the fiftieth anniversary of the invention of the incandescent lamp.

In some cities special committees have been formed, while in others the movement will be sponsored by electrical cooperative leagues or local electric clubs. Portland purposes the formation of a general committee, composed of the Mayor, president of the Chamber of Commerce and other prominent people to act as a sponsoring committee, and the newly organized Portland Electric Club will likely take over the major portion of the work.

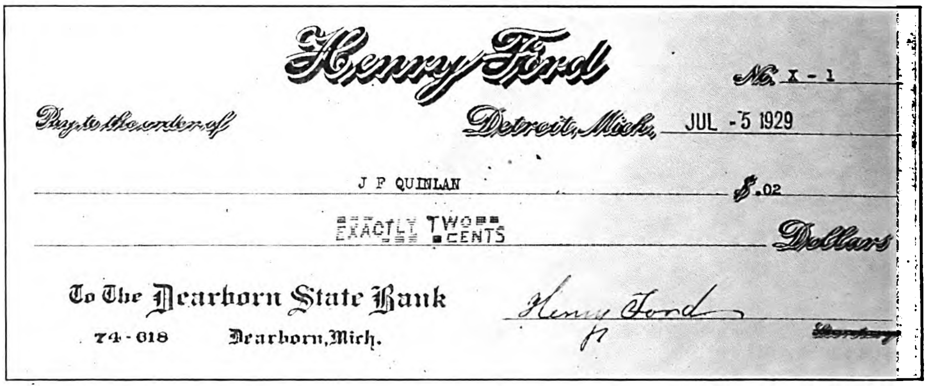
An impressive local demonstration is planned for Spokane, with attention focused on Spokane's position on the official lighted airways. Through various local channels Salt Lake will recommend intensive improvements in illumination standards and make suggestions for appropriate lighting in connection with Light's Golden Jubilee week. During that week some novel lighting effects are planned and meetings with electrical, industrial and social groups will be held.

Present indications are that Denver will make the celebration a civic affair, with the electrical industry aiding in working out plans. Some consideration has been given to an illuminated pageant. A committee has been formed in Seattle, but no definite plans have been made up to this writing.

The Industry's Part

On July 17, M. S. Sloan, president of the National Electric Light Association addressed a letter to member company executives in which he said:

> "I feel that the utility companies will want to assist in this broad national tribute to Mr. Edison by making the participation of each local community one that is in full keeping with the concept. The spirit of



Henry Ford

No. X-1

Pay to the order of

Detroit, Mich., JUL -5 1929

J F QUINLAN $.02

EXACTLY TWO CENTS Dollars

To The Dearborn State Bank

74-618 Dearborn, Mich.

Henry Ford

MOTOR MAGNATE LIQUIDATES UNUSUAL LOAN

THAT Henry Ford pays his debts promptly and considers small things equally as important as big things is evidenced by his personal check for two cents which he handed to J. F. Quinlan, executive secretary for Light's Golden Jubilee when Mr. Quinlan paid Mr. Ford a visit recently at Dearborn, Mich. It was necessary for the motor magnate, as reported in the June issue of the BULLETIN, to borrow two cents from the Jubilee secretary on the occasion of Mr. Ford's purchase of the first Edison Commemorative postage stamp to be placed on sale at Atlantic City on June 6. Mr. Ford promised at that time to repay in full.

According to Mr. Ford, this is the first personal check he has signed in five years. Mr. Quinlan has informed Mr. Ford that his checking account will forever be out of balance, for he does not intend to cash the check.

Light's Golden Jubilee, as expressed at the Atlantic City Convention, should be translated into every community in the country. It affords an opportunity for the public and the industry to express a tribute to Mr. Edison and an appreciation of his contribution to the electrical art. Already many cities and towns have plans in motion for participation.

"It is suggested that insofar as possible in each community a committee, made up of leading citizens, should be formed to develop plans and carry them through. It seems fitting that the utility company should take the initiative in promoting such a local committee.

"If you concur with the idea, may I suggest that you personally undertake the task for your community?

"I would appreciate your writing me your decision."

Responses to this letter have been pouring in which confirm the electrical industry's desire to whole-heartedly and actively participate in the celebration.

The July 20 issue of the *Electrical World* was a special Golden Jubilee number and covered in detail every phase of the celebration that has been developed so far. This issue of the *World* with the official Jubilee Book issued by Light's Golden Jubilee Committee and the "Suggestion for Local Participation," published by the National Electric Light Association should prove of great benefit in the organization of local celebrations.

Light's Golden Jubilee in Foreign Countries

ALTHOUGH at first considered as a strictly American celebration, many foreign countries are taking cognizance of Light's Golden Jubilee and are making plans for some observation of the event.

This change has come about since the convention of the National Electric Light Association, at which time the Jubilee was inaugurated. Many delegates from foreign countries were in attendance at Atlantic City and witnessed the ceremonies incident to the starting of Light's Golden Jubilee.

To give these foreign delegates a clearer conception of the purport of the Jubilee, a luncheon meeting was held at the Shelbourne Hotel on June 6 under the auspices of the Association, with S. E. Doane presiding. N. H. Boynton of Nela Park, Cleveland, explained in detail how various American communities were preparing to signalize the Fiftieth anniversary of the invention of Edison's electric incandescent lamp, and what literature was available to aid others in also celebrating the event.

It was suggested that until the culmination of the Jubilee on Oct. 21 at the great demonstration to be given at Dearborn, Mich., it would be appropriate and feasible for many cities including those in foreign countries to put in a celebration in honor of Mr. Edison accompanied by spectacular lighting effects.

Certain it is that as a result of the meeting many celebrations will be staged in South American and Japanese cities. Among the foreign delegates in attendance at the luncheon meeting were: Shizuo Katoh, Pres. Inst. of Electrical and Mechanical Technology, Tokyo; Ryotaro Takai, E. E., Tokyo Electric Light Co. Ltd., Tokyo; Yasauemon Matsunaga, Pres. Toho Denryoku Kabushiki Kaisha, Tokyo; Jiro Honda, Guaranty Co., New York; Daijiro Ide, Tokyo Electric Power Co., Tokyo; H. A. Chapman, Toho Electric Power Co., Tokyo; Allan Maughan and S. B. Cox, Australia General Electric Co., Sydney; Mauro Herlitzka, Compania Anglo-Argentine, Buenos Aires; Mauro Herlitzka, Jr., Compania Anglo-Argentine, Buenos Aires; C. E. Dorion, Empresa Guatemalteca de Electridad; G. E. Sands, Compania Energia Electrica Rio Porto Alegre Rio Grande do sul, Brazil; Harvey Diamond, Compania Chilena de Electridad, Santiago; S. Masson, Usinas Electricas del Estado, Montevideo, Uraguay; W. A. Haile, Emprezas Electricas Brasileiras, S. A. Brazil; Dr. Marinbo de Azevedo, Brazil; Dr. Samuel Claro, Chile.

Barnes Gives American Viewpoint on Ownership of Business Enterprises

TO Julius H. Barnes, former president of the United States Chamber of Commerce, fell the lot of presenting, on July 12, before the International Chamber of Commerce, in session at Amsterdam, Holland, the American viewpoint concerning private and public ownership and operation of business enterprises. In the course of Mr. Barnes' address, which was followed with much interest, he said:

"In the field of public utilities for light and power service there is the same record of extraordinary efficiency in development and in administration. A vast interconnecting network reservoir of electric power, both coal-generated and hydro-generated, has resulted in distributing peak loads so economically as to reflect in lowered charges, rates being now lower than the pre-war basis.

"Governments may imitate the practices of private enterprise and here and there may occasionally register some advance, but in the great fields of transportation, communication and electric utilities the significant accomplishments are in overwhelming measure the product of private enterprise. These three monopolistic public services are regulated by public bodies protecting the public interest through continuous and flexible control of charges and practices, always subject to appeal through the established courts as high as the national Supreme Court itself.

"In the light of the enormous expansion of all industry resting on these three basic facilities and in the light of the steady rise in average living standards of all our people, there are few indeed in America who do not today realize that it is more important to have adequate and efficient service than it is to force an unwisely low level of charges that might check expansion and improvement. The policy of public regulation instead of public operation has justified itself a thousandfold in these services themselves, while the benefit of such services can be clearly indicated in the expansion and growth of all industry."

At the close of the discussion the congress, by resolution, declared that "private initiative and private operation of enterprise constitute the most effective instrument to assure the progress of industry and to increase general prosperity." To the formal resolution the American delegation added this comment:

"In increasing productivity, advancing living standards and developing the most widespread prosperity, the American delegation has been asked to outline the steps that have led to the most significant results of modern industry in American experience. We find it due to the following factors:

"1. Machinery aiding the worker and supplied by large capital ventures, making each worker more efficient.

"2. Increased wages and reasonable hours, increasing the value of that productivity by increasing the worker's buying power.

"3. Ownership of the industries in part by the workers by means of stock investments, giving the workers a financial interest in the prosperity of the company.

"4. Capital flowing in freely, unafraid of any possible government competition."

Thomas E. Murray

THOMAS E. MURRAY of New York died July 21 at his summer home in Southampton, L. I. By his death the electrical industry lost a distinguished inventor, to whom, it is said, more patents were granted than to any other man save Thomas A. Edison; an engineer of large achievement, and a light and power company executive who had much to do with the growth and success of the New York Edison Company and the United Electric Light & Power Company, its close ally.

As a builder of power plants also Mr. Murray had a record of unusual activity and accomplishment. His total installation of 2,168,380 kw. is probably larger than that of any other man in the industry.

Mr. Murray was born at Albany, N. Y., Oct. 21, 1860.

In 1898, after a successful record with public utilities in Albany, the late Anthony N. Brady brought Mr. Murray to New York to effect the physical merger of the electric lighting systems in Brooklyn, and shortly afterward Mr. Brady also intrusted to him the task of consolidating the electric lighting properties in Manhattan into the New York Edison Company, of which property Mr. Murray became second vice-president and general manager. He was senior vice-president at the time of the merger last year taking on the Brooklyn Edison Company, when he became vice-chairman of the board. He had also been president of the Yonkers Electric Light & Power Company and vice-president of the United Electric Light & Power Company. He founded the Metropolitan Engineering Company as well as the consulting engineering firm of Thomas E. Murray, Inc.

In the midst of these activities Mr. Murray found time to patent hundreds of inventions a large proportion being electric protective devices.

In his more recent years Mr. Murray gave considerable attention to electric welding and obtained a large number of patents covering his work in this field. Other devices covered by his patents cover such varied lines as steam boilers, the water-wall furnace for steam boilers, which has revolutionized boiler design; copper radiators, high-tension electric switches and fuses, electric protective devices, cinder-catching device for eliminating nuisance from stacks, automatic stoking device, pulverized-fuel equipment, refrigerating machines, reactance coils, concrete duct systems, electrically welded valves, fittings and pipe joints, coal hoppers, hydro-electric elevators, steel-plate flywheels, trench motor shells, axle housings and household appliances.

Mr. Murray for two years was president of the Association of Edison Illuminating Companies. Among the many honors he received were the honorary degrees of doctor of science, conferred on him by Villanova College, Pennsylvania, and doctor of laws by Brooklyn College. He was a member of the A.I.E.E. and other electrical and engineering associations.

Samuel M. Kennedy

SAMUEL MACAW KENNEDY, retired vice-president of the Southern California Edison Company in charge of business development and public relations, who gave up active work in 1927 because of ill health, died on Thursday morning, July 18, at his home in Alhambra, Cal. Funeral ceremonies were held at the Church of the Saviour, San Gabriel, on Saturday morning.

Mr. Kennedy was actively interested in the work of this association and served on a number of important committees. He achieved a national reputation because of his pioneer championship of the cause of good public relations.

Mr. Kennedy was born in Toronto, Canada, in 1863, and was educated in the Dominion. After some business experience in Europe, he became assistant to the president of the United Electric Power & Gas Company, Los Angeles, in 1900. This company was absorbed by the Southern California Edison Company in 1903, when Mr. Kennedy was made head of the commercial departments. In this post his original and progressive methods in commercial organization and business development not only contributed largely to the tremendous growth of the Southern California Edison, but also did much to stimulate the development and earning power of the electrical industry on the Pacific Coast. In 1920 he was made a vice-president of the company.

In addition to many contributions to the trade press on the subject of public relations he was the author of three publications written to serve this cause —"The Man in the Street," "Service" and "Winning the Public." The first two of these were in the form of essays and booklets. The third, published as a book in 1920, took rank at once, because of its comprehensive treatment of the subject and its direct and racy style, as a classic in its own line.

Mr. Kennedy had the misfortune to break his hip and arm as the result of a fall about three and a half years ago, and he never completely recovered from the accident. Besides his connection with the Southern California Edison Company, he had been vice-president of the Santa Barbara Suburban Railway and the Pacific Gasoline Company and a director of the Alhambra Savings and Commercial Bank. In addition to having been an active worker in the National Electric Light Association, he was a member of the A.I.E.E. and A.E.S.

William S. Andrews

AN APPRECIATION

WHEN a veritable martyr to science in the person of William Symes Andrews, consulting engineer of the General Electric Company, and an early assistant of Thomas A. Edison, passed away at his home, 1018 Park Avenue, Schenectady, N. Y., the afternoon of July 1, 1929, the world at large lost one it will be difficult to replace. Endeared as he was to scientists and technicians for his many contributions to theory and practice, he was equally endeared to all whose privilege it was to really know him, as a man of lovable character, sterling integrity, seeing the good, and only the good, in every situation with which he was confronted. Handicapped by many afflictions for several years and for many months confined to his bed because of these afflictions, all the direct result of his earlier efforts for the advancement of science, his constant thought was that of gratitude to God, and to those who ministered to his requirements, that his lot was not as bad as it might have been. To those familiar with his condition it would be difficult indeed for any but natures such as his to conceive reasons for gratitude, but Mr. Andrews saw them and never failed to express them. The superlative spartanism he exhibited throughout his illness, in fact throughout his entire life, will long remain a cherished memory.

Mr. Andrews contributions to the electrical industry, as well as to science in general, were numerous. He was one of the loyal band of workers who assisted Mr. Edison in the early electric light experiments at Menlo Park, N. J., as well as in the practical development of the electrical industry resulting therefrom. Had he lived until December next he would have celebrated his Golden Jubilee with the industry he did so much to perfect. That he did not is a loss to science, and to those priviledged to call him friend.—F. A. WARDLAW, *Secretary, Edison Pioneers.*

Bill Jones Idea

The Human Touch in the Relations of Utility to Customer

By G. I. VINCENT

Vice-President, The Syracuse Lighting Co., Inc.

THE sole aim of all the thought and effort devoted to our public and customer relations problems is the making of satisfied customers. Contented customers mean good-will and prosperity for the utility company. What will make a customer contented, or, in other words, what should the customer think in order that we can expect him to be contented?

Keeping in mind that we are not discussing the relatively few in our communities but the great body of our customers to whom we apply the generic term "The Man on the Street," can we not say that if he is to be our contented customer he would think somewhat along the following lines:

The Contented Customer

He would have confidence in the utility. He would expect to receive his service at a fair and reasonable cost. He would like to know that in his contact with the employes of the utility, whether it be personal, by telephone, or mail, he would be met with friendly courtesy. He would like, above all things, to know that when he required service in his household he could not only secure it when he wanted it but that the required work would be well and completely done.

We cannot ascertain through the Chamber of Commerce or the Rotary Club whether our customers have confidence in the utility. Someone has said that the wise utility manager could find out more what his customers think of his business by visiting in the local fire houses than from all the business organizations in his community put together. If the utility is to enjoy the real confidence of its great body of customers it must be developed largely along indirect lines.

Speaking generally, the customer is receiving his service at a reasonable cost. It is highly probable that more equitable forms of rate will in the course of time, if not immediately, develop a better attitude of the customers toward the utility.

What chance has the most courteous and carefully trained employee to make friends with a customer when he first must explain why, because of yards of red tape, the customer cannot receive his service when he wants it?

It is to this phase of customer relations that Syracuse has given much thought without at all losing sight of the other fundamentals. As should be quite clear, the belief prevailed that unless this were properly developed to the contentment of the customer, accomplishment along the other lines would be seriously handicapped. This belief led to the adoption of "The Syracuse Idea," sometimes referred to as "The Bill Jones Idea."

The idea is now six years old so again it will be clear that it was inaugurated at a time when the promptness and completeness of service of the average utility was not at all what it is in most of them today.

> **Success many times results from the adoption of a plan or an idea that has been satisfactorily worked out by some other concern in a similar business. Our electrical industry is young, and we can profit by injecting new ideas into our operating, public relations, accounting and commercial departments.**
>
> **"Service Suggestions" offer a method for accomplishing this.**
>
> **"Service Suggestions" have proved of great value to the executives, heads of departments, and employes who have carried out the ideas.**
>
> **I believe that "Service Suggestions" should be read regularly by all who have their company's interest at heart, and who are personally ambitious. Doing this is bound to produce the acquired successful result. J. E. DAVIDSON, *President, Nebraska Power Company, Omaha, Nebraska, Past President N. E. L. A.***

Speeding Service

About the time of starting the plan, or shortly after, there was broadcasted to the industry the statement that one of the large utilities had succeeded in speeding up their residential customer service to the point that the average elapsed time from the giving of the order until its completion was twelve working hours. A little arithmetic and the application of a little probability will indicate how many of the customers must have waited overnight for their service. When Syracuse started its then new idea it was doing at least this well.

The business of The Syracuse Lighting Co., Inc., is electric and gas service, together with the selling of coke and appliances. Industrial electric and gas promotion is also active and efficient. The population served is about 200,000.

The problems confronting the company were:

1. To speed up the residential service.
2. To combine the residential electric and gas service, because in the customer's mind there was no difference.
3. To create a more intimate human contact between the customers and the company.

The company was at that time following the usual practice of concentrating the order taking at the main office and all order for service, whether telephone, verbal, or written, were received at this point. For verbal orders trained employees were delegated to receive the various kinds of orders, that is, service orders at one point, trouble orders at another, discussion of accounts at another, duplicate bills at another, credit at another, and so on ad infinitum. Clever writers and speakers have pictured the customers' first day under this system and it is useless to repeat it.

After the order was received it was sifted through various checking and counter-checking departments and finally sent by a messenger either to the electric or gas department where it awaited its turn to be dispatched to the particular employee trained to do the particular kind of work. Looking back on it, it does seem ridiculous that a customer coming to the office for what was in his mind—one order—would have to make contact with three or four employees in the office and subsequently have three or four men at different times arrive at his home to execute the work.

But at that time such a system was the accepted one. Naturally, the plan could not stand unchallenged after real thought had been given to eliminating lost time, even though the orthodox method of order taking and executing was followed.

Is it not a reasonable statement that even the most ox-like mind would not be contented with such service for something that is no longer a luxury but a necessity in his household activities?

Essentials of the Plan

It is not necessary to review all the studies that were made extending over nearly a year before the new plan was definitely inaugurated, but in general it was decided:

1. That the verbal order taking for all kinds of service would be concentrated at one point in the office, all checking and searching eliminated and the order transmitted instantly to the proper department.
2. That all telephone orders should bypass the order taking department entirely.
3. To reorganize the order executing department, making the customer instead of the job the unit.

Discussing the last first, it was believed, in spite of much adverse opinion, that it would be entirely possible to train the right kind of personnel to do all kinds of residential customers' service. It was obvious that it would be necessary to equip this personnel with transportation and carefully designed tools and material stock so that any order could be executed. Regardless of a customer's ignorance of his requirements, what he really wanted could be done for him. It was also clear that changes would be required in the installation standards in order to fit in with the fundamental idea of instantaneous service.

Instead of operating the entire territory with a corps of specialists it was divided into districts, now twenty-five, and in each district was placed a man working out from headquarters and receiving most of his orders by telephone at intervals of one and one-half hours during the day. Light automotive equipment is used with the bodies designed to carry the necessary electric and gas meters and other stock which was found by careful study would be required.

Verbal orders received at the office are transmitted by telautograph to the operating department. The telautograph repeats in the credit department where the order is instantaneously checked for credit. It also repeats in the operating department which can start execution at once. Any questions as to credit are disposed of while the order-taking employee is still in contact with the customer.

Telephone orders for service go directly to the order executing department and are relayed out by telephone at the one and one-half hour intervals. The telephone order is the only application that is taken, as the only reason for the application is to secure the customer's full name correctly. If this cannot be understood over the telephone the service man is instructed to secure the application and determine the credit responsibility.

The service representative does work other than that called for by the order. For example, if his order calls for turning on gas and electric service he will adjust the gas appliances if necessary. He will deliver and put in fuses or instruct the customer how to install them. Anything else which needs attention or which the customer requests is taken care of. He is frequently stopped by customers who see him in the neighborhood and asked for service which is cheerfully given. During moving peaks a large percentage of the orders for turn-offs and turn-ons never appear at the office at all until after execution.

Only the high spots of this system, which, after six years, is functioning so smoothly that we hardly realize its existence, can be covered in this brief article. Three fair questions may be asked:

1. Have the customer relations been improved?
2. How much does it cost?
3. What do these high-speed all-service representatives do anyway?

I called to-day at your request and was unable to gain admittance.

Will you please advise us when it will be convenient to you for me to call again?

____
SERVICE REPRESENTATIVE
THE SYRACUSE LIGHTING CO. INC.

______________ 192______________M

Front and back of a card used by service representatives

The first question can be answered by asking another. If the average customer has come to know a pleasant, well-trained representative of the utility who renders service more promptly and completely than he receives even from the competitive businesses, will the customer not think more favorably of the utility?

As to our second inquiry, while more work is done for the customer, the transportation cost, which is one of the big items in modern utility customers' work, is obviously less than by the ordinary method. If a careful allocation of costs were made by superposing the standard method on the Syracuse idea it would be found that the standard method is the more expensive one.

There is an interesting development in the cost of this service in that the representatives are compensated through a good base wage plus participating premiums for quantity and efficiency. The group also gives much valuable aid to the sales department. When it became necessary to market coke produced by a new coal gas plant this group was used as a sales organization and marketed the entire output all to the domestic trade for which they were well compensated, but at a selling cost greatly below that of an average coke sales organization. Creation of a domestic market for a material like coke from nothing to over a million dollars' gross in slightly more than two years is an accomplishment which gives some conception of the value of this group as a selling agency.

What do they do? Well, among other things, these service representatives set, change, and remove meters and turn on and shut off service. They locate new electric service entrances and measure and collect for new gas services. They handle all kinds of appliance adjustment and other trouble orders. They deliver some merchandise and connect some gas appliances where only a few fittings are required. They are used to check up decreasing sales and do emergency work for the collection department. Inquiries as to high bills are investigated and disposed of. They develop sales prospects and do some selling when time permits. In fact, they do anything and everything for the residential and smaller commercial customers and also make emergency first calls on the large industrial customers. By a lap shift and a small night force, with Sunday and holiday shifts by turns, a complete service is available to our customers twenty-four hours a day every day in the year.

Why is the Syracuse system frequently called the "Bill Jones" idea? One time at a convention a man talked on utilities' customers service in its connection with public relations. He said that the little tiny utility whose manager, Bill Jones, was the whole works, never had any customer relations problem. Bill knew everybody in his little town by their first name and everybody knew Bill. His operations were hopelessly inefficient, but the self-serving demagogue would not have gotten a good start in his community. The speaker said that when, however, the little utility grew to huge size and marvelously improved efficiency, it lost its human touch and became a thing instead of a personal entity. A part of the Syracuse idea is to bring back this human touch in the relations of the utility to its customers. A special newspaper writer looking for a story about the time that the idea was being inaugurated dubbed the high-speed all-service representatives "Bill Jones." The name stuck. It was homely and probably undignified but folks seemed to like it.

Could the Syracuse idea be established in a much large utility? Undoubtedly it could, but the problem would be admittedly more difficult. The tieing in of a number of order taking and order executing departments presents an interesting but solvable problem. The greatest handicap would probably be found in breaking down departmental lines. The customers' all-service department must necessarily take over many departmental activities. It is essential that the chief executives must be thoroughly sold on the idea. These obstacles could be solved and overcome and the plan adopted for the betterment of service and upbuilding of customers' good will.

Electrical Research Statistics

August, 1929

Issued Monthly by Statistical Research Department of the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

H. A. Snow, *Chairman, Statistics Committee, Accounting National Section*
Wm. M. Carpenter, *Economist*
H. S. Bennion, *Director of Engineering, N. E. L. A.*
Merle Rainey, *Statistician*

The National Electric Light Association, a voluntary organization of companies and individuals affiliated with or interested in the electric light and power industry, organized to advance the art and science of the production, distribution, and use of electrical energy for public service.

The Association maintains a Statistical Research organization which collects, interprets, and makes available basic statistical information on the electric light and power industry. The publications and services of this department are available to all those interested, on request.

Current Statistics of the Electric Light and Power Industry

(As of May 31, 1929)

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	APRIL			MAY		
DURING MONTHS OF APRIL AND MAY	1929	1928	Per Cent Increase	1929	1928	Per Cent Increase
*Kw-hr. generated (net)	7,379,347,000	6,357,342,000	+16.1	7,597,585,000	6,645,113,000	+14.4

Basic Information on the Electric Light and Power Industry
As of May 31, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the Bulletin.

1. Value of plant and equipment	$10,250,000,000
2. Total generating capacity in kw.	28,129,000*
Steam	20,145,000
Waterpower	7,688,000
Internal combustion	296,000
3. Total number of customers served	23,853,000
Farm customers (as reported by 190 companies only)†	(335,338)
Domestic customers	19,454,000
Commercial customers	4,346,000
4. Population in electrically lighted homes (Electrical World)	81,500,000**
5. Percentage of homes which are served with electricity	66**
6. Miles of transmission lines (11,000 volts and above) (circuit miles)	150,000**

*Subject to revision. **As of January 1. †Included below.

More Service at Lower Rates

According to a statement issued by the Statistical Research Department of the National Electric Light Association, reviewing the use of domestic electric service, Mr. Henry Ford's ideal of providing more and more electricity for less and less money as set forth in an interview appearing in the *Electrical World* of July 20, has been followed by the electric light and power industry ever since the war.

In 1918, following the lifting of restrictions on the use of electricity during the period of war emergency, the average household in the United States used 272 kilowatt-hours per year. Since that time the use of electric service by this same average household has been steadily increasing. In 1920 the figure stood at 339 kilowatt-hours; in 1922 at 359; in 1924 at 378; in 1926 at 404, and in 1928 it had risen to 459 kilowatt-hours, which represents an increase of nearly 70 per cent over the figure of ten years ago.

Taking the United States as a whole, the average price of residential electric service has steadily declined. From 8.3 cents per kilowatt-hour in 1918, it dropped to 7.5 cents in 1920 and then progressively to 6.55 cents in 1928, although the cost of living and of all items entering into the construction and operation of utility service have steadily increased during the same ten-year period.

It is within the past twelve months, however, that this provision of more service at lower rates has received an additional impetus. An examination of the quantities which have appeared each month at the bottom of the tables of monthly statistics shows that the average price of domestic service—again taking the United States as a whole—has shown a further decline. Arranged in tabular form, the figures for average use, average price and the consumer's average annual bill stand as follows:

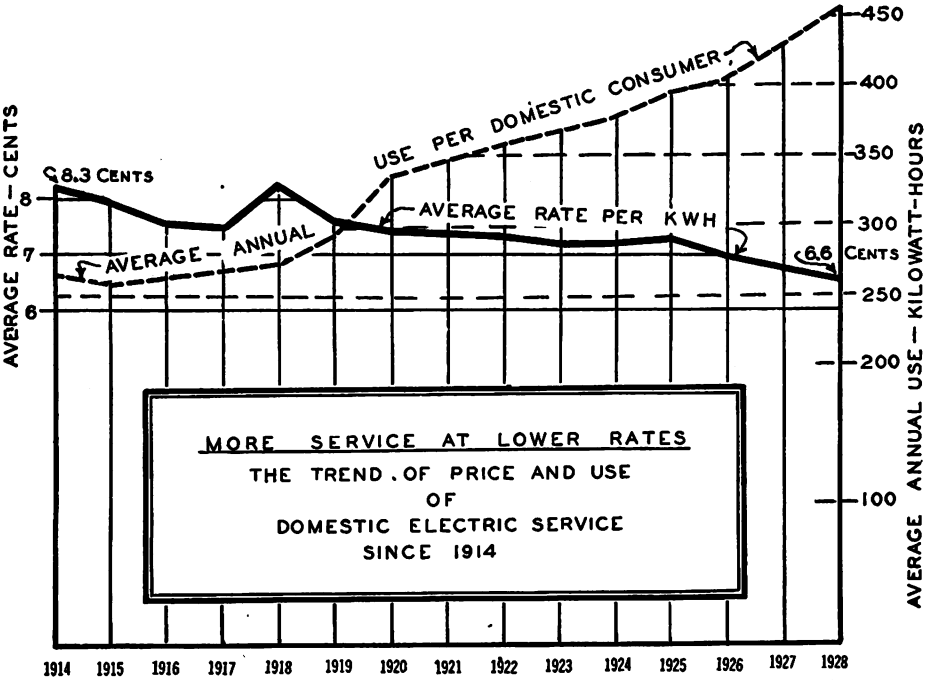
DOMESTIC ELECTRIC SERVICE

(For the United States as a Whole)

Twelve Months Ending:	*Average Use, Kw-hr.*	*Average Annual Bill*	*Average Price Paid per Kw-hr.*
Dec. 31, 1914	268	$22.25	8.3c.
Dec. 31, 1920	339	25.25	7.5
Dec. 31, 1922	359	26.50	7.4
Dec. 31, 1924	378	27.25	7.2
Dec. 31, 1926	404	28.26	7.0
Dec. 31, 1927	429	29.20	6.80
Dec. 31, 1928	459	30.10	6.55
* * *	* * *		
Feb. 28, 1929	463	30.28	6.54
Mar. 31, 1929	468	30.42	6.50
Apr. 30, 1929	472	30.40	6.44
May 31, 1929	476	30.46	6.40

During the recent Convention of the National Electric Light Association in Atlantic City, speaker after speaker stressed the importance of increasing the use of domestic electricity, this increase to be brought about by a reduction in price. Mr. Matthew S. Sloan, newly elected President of the Association, in an address entitled "Sales Increase or Rate Increase," said emphatically: "We must sell more kilowatt hours for each dollar of investment, making our equipment work harder and steadier and the place to sell more service, in my judgment, is in the home." Concluding his address he said: "It seems to me more than a coincidence that in every case I know of a reduction in domestic electric rates has been followed by increased use of service. There may be instances where this was not true, but they have not come to my attention. It was true in Brooklyn under conditions which covered a series of reductions over a period of several years. It has been true in up-State New York, in New England, in Middle West, and on the Pacific Coast. These companies which show the highest annual domestic sales also show the lowest rates. We have, therefore, in the experience of our industry, what may be accepted as a guiding principle in stimulation of sales service for domestic use. The way to increase such sales is to wisely and properly lower the domestic rates."

The attached chart shows year by year, since 1914 and up to Dec. 31, 1928, the increase in the average use per customer, coupled with the decrease in the average price.



National Electric Light Association Statistical Research Department

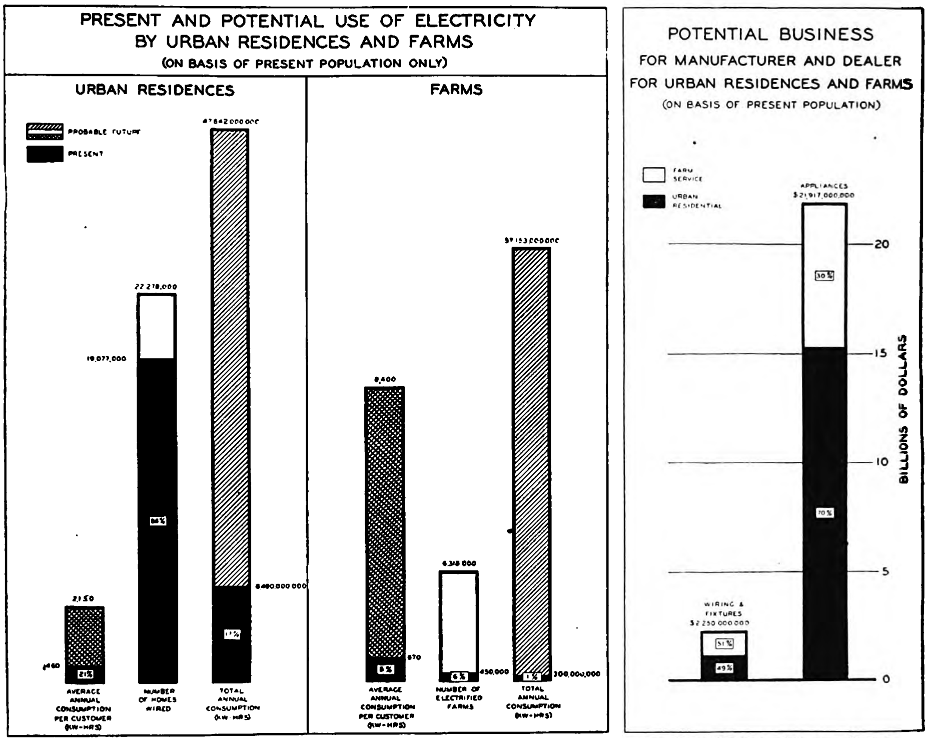
Potential Business Existing in Complete Electrification of Homes and Farms

NEARLY twenty-five billion dollars of potential business exists in wiring, fixtures and appliances for the manufacturer and dealer of electrical equipment in the complete electrification of homes and farms, according to the accompanying chart, recently exhibited at the Atlantic City Convention of the National Electric Light Association by the Statistical Committee.

At the present time, the average urban home takes only barely one-fifth of the amount of current which a fully electrified household can successfully use, while the average farm takes only one-twelfth of the electricity which agricultural surveys have demonstrated can profitably be put to work. In addition to this, there are still more than three million urban homes and nearly six million farms which at present have no electric service.

In order that the homes and farms of the United States may be able to use electric service to its greatest advantage, two and a quarter billion dollars worth of equipment is indicated in new wiring and fixtures, while a market of nearly twenty-two billion dollars is shown for appliances of all kinds ranging from heavy farm motors to flat irons and electric fans.

LOOKING INTO THE FUTURE



Statistics Committee, Accounting National Section N. E. L. A.

More Work from Less Coal

ACCORDING to a statement issued by the U. S. Bureau of Mines in its recent publication "Coal in 1927," "the production of fuel power has risen from 4,000,000,000 kilowatt-hours in 1902 to about 53,000,000,000 in 1928. The consumption of coal has increased during the same period, but in much smaller ratio. In 1902 the utilities used, in round numbers, 11,000,000 tons; in 1928 they used 41,300,000, an increase of less than 400 per cent against the 1300 per cent increase in power production."

In analyzing the conclusions outlined by these figures, the Statistical Research Department of the National Electric Light Association has grouped on the accompanying chart the trends in the consumption of fuel by the three largest users of coal in the United States; that is, electric power, iron and steel, and the railroads; as shown in the Bureau of Mines report. Everywhere that coal is used there has been a continued and progressive increase in thermal efficiency, as a result of expanding industry, larger units, and the cumulative results of twenty-five years of research and invention.

The iron and steel industry now produces the same amount of output with 32 per cent less fuel than it did in 1904, as the result of larger furnaces and better metallurgical and mechanical technology.

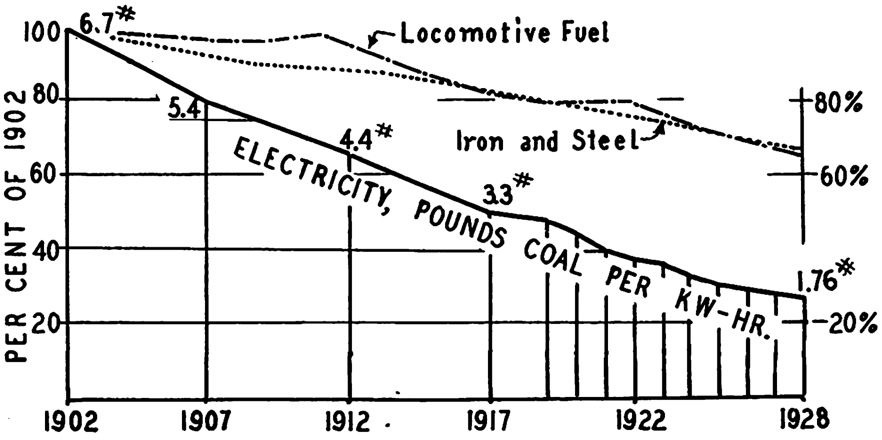
The railroads now obtain the same amount of work with 33 per cent less locomotive fuel than they did in 1904, reflecting the continued replacement of smaller and obsolete engines with larger and more powerful locomotives, the use of longer trains and higher speeds.

It is in the electric light and power industry, however, that the results of fuel economy have been most pronounced. In 1928 the same amount of energy was produced with 71 per cent less fuel than would have been required in 1904.

Great as these advances have been, there is still room for further improvement in bringing the average performance nearer to the level of what the best performance has already indicated as being possible.

INCREASING THE EFFICIENCY IN THE USE OF FUEL

SHOWING THE RELATIVE DECREASE IN THE AMOUNT OF COAL USED PER UNIT OF OUTPUT, BY THE RAILROADS, THE IRON AND STEEL INDUSTRY AND THE ELECTRIC LIGHT AND POWER PLANTS OF THE UNITED STATES.



(From "Coal in 1927" by the U. S. Bureau of Mines)

ENGINEERING SECTION

Alex. D. Bailey, *Chairman*   **H. S. Bennion**, *Director of Engineering, N. E. L. A.*

Annual Reports of Engineering National Section Committees

Editor's Note: Herewith are printed summaries of the activities of several of the Committees of the Engineering National Section during the administrative year 1928-1929. This information, in previous years has been presented in the form of reports to the National Convention. It is now felt, however, that because of the nature of the reports, and the greater and more diversified circulation of the N. E. L. A. Bulletin, that the reports would prove of wider usefulness if published in this medium. Reports of other committees will appear in the next issue.

Report of the Power Systems Engineering Committee

L. W. W. Morrow, *Chairman*

THIS COMMITTEE was organized in Philadelphia on October 10, 1928. It held two other meetings during the administrative year—one at Cleveland on January 11th, and one in Memphis on March 11th.

During the year the committee concerned itself with the general problem of developing a guide for the coordination of the utility system as a whole. The work was confined to discussions covering different phases of the problem.

At Cleveland several utility executives outlined in detail the complete executive plan used in developing their respective systems. Properties presented were: The Detroit Edison Company, the Ohio Public Service Company, the Southeastern Power and Light Company and the Kansas Gas and Electric Company. As was to be expected, the older and more compact properties had developed system planning to the greatest extent, but all the executives accented the need for this work and pointed out its advantages and disadvantages.

Following this presentation, there was developed material on the engineering planning of systems at the Memphis meeting. The engineering reasoning back of individual system designs and the plans for meeting future needs were presented on the following properties: Brooklyn Edison Company, The Detroit Edison Company, The American Gas and Electric Company and the Oklahoma Gas and Electric Company. These transmission and metropolitan systems offered a splendid cross section of the variety of conditions encountered in system engineering planning.

The Memphis meeting showed it to be impossible at this time to go farther with the fundamental system plan as regards its engineering phases without some studies on separate aspects or problems. It is possible to make a skeleton outline of the fundamental plan, but the committee believes it will require some time to arrive at any detail statements for general use in the engineering assembly of systems.

For the next year the committee recommends a continuation of the work on the fundamental plan and, in addition, the appointment of subcommittees to deal with basic engineering problems now encountered. The present subcommittees have been held inactive except for the subcommittee on High Load Density Distribution. This subcommittee, under the direction of Mr. S. M. Dean, has completed a great deal of work.

Some of the basic engineering problems in the industry, to be dealt with by this or other committees, are listed as follows:

Basic Power System Engineering Problems

1. System stability under all conditions and fluctuations of load is desirable. Abnormal conditions are being investigated and apparatus and methods are being developed. High speed switching and excitation, current limiting devices in neutrals, and split winding generators and transformers are some recent developments to improve stability.

2. The design of circuit breakers and associated equipment for the interrupting capacities and voltages now encountered on power systems is still a problem of primary magnitude. Several new ideas in breakers have been presented and the entire breaker situation is in a state of flux.

3. Lightning and its effects on apparatus and service continues to be an unsolved problem. Much laboratory and field work has been done, but much remains to be done. The entire insulation of a system is in process of serious study.

4. Continuity of service is desirable to secure at a minimum cost. There is need for better selective relay schemes and for better layouts and plans to reach a goal of 100 per cent service. Automatic throwover switches have improved conditions, and the network principle has been used effectively in some cases.

5. It is desirable to fix the total spare generating capacity on a system on a better basis.

6. Methods to control the frequency, the watt and wattless energy on large systems are inadequate and must be improved. Tap changing transformers, synchronous condensers, series capacitors, pilot wire governor control and other developments are improving the situation.

7. Better voltage regulation is desirable in all parts of a system. The cost of good regulation is high, especially on the widely extended distribution lines.

8. System grounding continues to be a difficult problem with many variations in methods and practice. This problem has many ramifications, but is of great importance.

9. Now that preferred system voltages have been approved, it is desirable to go further and fix Y and Delta arrangements between preferred voltage systems, so that both phase relations and voltage magnitudes will permit parallel network and interconnected operations. This problem is associated with grounding.

Conclusion

The major ideas and premises of the committee were carried out this year. One object was the development of a perspective whereby a utility system would be viewed as a complete assembly that required an economic as well as an engineering knowledge to develop. A second object was to get adopted the idea that system growth should be planned and that a planning department was a necessary function in the utility business. These two ideas have been stressed to the exclusion of details, and the way is now cleared for an attack on those major engineering problems whose solution must be had before a fundamental system plan can be made. Interest in the work of the committee is great and all members contributed to the development of the committee program.

Report of the Prime Movers Committee

ÉDWIN B. RICKETTS, *Chairman*

IN the serial reports of the Prime Movers Committee for the administrative year the Committee has, as in the past, endeavored to reflect the progress in design and operation of steam power plant equipment. While it is impossible in this brief summary to give an adequate picture of the many important phases of the development which have taken place, it may be of interest to record here a few of the trends which these reports indicate.

There has been no material change during the past year in steam pressures and temperatures. While several new plants or extensions are under way to be operated at 1400 lbs., the bulk of the new installations are for pressures of 400 to 500 lbs., and it is indicated that relative values of these two pressures are mainly dependent on local conditions. The rise in steam temperature seems to have halted at about 750 deg. Fahr., pending the development of new alloys for higher temperature service.

The size of individual boiler units has kept pace with the increase in size of turbo-generators. Several boilers having a maximum capacity of 800,000 to 1,000,000 lbs. of steam per hour will be in service before the end of the year, each of these boilers will be capable of serving upwards of 80,000 kw. of turbine capacity. The almost universal use of water cooled furnaces, particularly in connection with pulverized fuel firing, has very largely decreased boiler outages. One large station so equipped has operated for the past eight months with a service demand availability factor of 100 per cent, this record indicates that we may yet build power plants with one boiler per turbine.

The present limit of individual stoker capacity seems to be about 500,000 lbs. of steam per hour; while there is no indication, however, that the limit of capacity for pulverized fuel furnaces is in sight.

An extensive survey of the operating records of both single and two pass condensers has been made. This survey indicates no decided advantage for either type, it being indicated that, on the average, heat transfer of about 80 per cent of the makers guarantees are realized under operating conditions.

The operating history of large turbines has been brought up to date.

A slightly improved record is shown, but the improvement is not sufficient to be significant. This operating history which has now been kept for a number of years is of particular importance because of the light it throws on the availability for service of increased primary capacity.

Report of the Inductive Coordination Committee

H. L. WILLS, *Chairman*

IN connection with the December meeting of this committee, one day was given to joint session with the Development and Research Subcommittee, with the view of bringing before the members of the Inductive Coordination Committee the problems which confront the Development and Research Subcommittee, and at the same time bringing to the attention of the members of the Inductive Coordination Committee the great amount of work that is under way and the large amount of detail which must be handled by each project subcommittee; and, further, that the work of each of these subcommittees must, of necessity, be coordinated with the work of one or more of the other project subcommittees. This move was deemed to be essential at this time by reason of the fact that there is a continual demand and a growing unrest among the members of the Committee in regard to lack of information and technical reports which they feel should be forthcoming from the development and research work.

Development and Research

While the Development and Research Project Committees are not in position to send out very many specific, detailed reports, it is true, nevertheless, that officials of member companies with the N. E. L. A. can obtain any information with regard to the work of the several project committees. Whenever they are interested to the extent that they will make a specific request for such information, this may be obtained through application to Headquarters; and once the knowledge that this is true is more generally recognized, there will probably be less pressure brought to bear on these project committees for rapid completion of their work, which, in general, would be very detrimental in the long run, by reason of the fact that the problems submitted to each subcommittee must be worked out to the last analysis, and the results of their work will thereafter stand as the fundamental basis upon which principles may be set down with the assurance that the principles so evolved will be subject to very little change in the years to come.

Current Cases

One of the important lines of work that has been carried on by the Inductive Coordination Committee is found in our so-called Current Cases work. During the year we have followed up nine specific cases where one or more members of the Current Cases subcommittee have been able to assist in reaching more or less satisfactory conclusions of differences in the field.

Radio

Our Radio subcommittee has been active throughout the year, keeping in close touch with developments at Washington, D. C., protecting, as far as possible, the interests of the industry in radio communication for use of the power companies. The one important thought in this connection lies in the fact that in so far as this subcommittee has knowledge of the situation, the member companies of the N. E. L. A. in general have not taken advantage of the opportunities which have been given to them to utilize radio communication to the extent that would justify the Federal Radio Commission in setting aside for our specific and undivided use certain frequency channels in the radio frequency spectrum.

Automatic Train Control

Our Automatic Train Control subcommittee has practically finished its active work, and is now being held together with the idea that they will watch the general development of train control so that they will be ready as an organized body to take up any questions which may arise in this field which are of interest to the electric light and power industry.

Educational

Our Educational subcommittee has completed its analysis of the general subject of education along inductive coordination lines, and submitted a report covering a topical outline of the subjects to be treated in this course, and showing the more important details which should be considered under each subject.

To prepare this course it was the opinion of the committee members that one or more thoroughly competent men should be secured to devote all of their time and talent to its preparation. Lack of funds to accomplish this has brought the work of this subcommittee to a standstill.

Carrier Current Communication Systems

Carrier current communication systems are being put into service on the transmission lines of power companies in a great many places. In the development of these several systems of carrier current by the different manufacturing companies, it has been found that cooperative consideration as between the several manufacturers and the telephone interests and ourselves was necessary to avoid inductive interference with telephone operation, and also to obtain such coordination between the several systems as would make it possible to interconnect one system of carrier communication with another system of carrier communication in the same territory. Our subcommittee has accomplished a large amount of effective work in this regard, and has secured a general recognition of the fact that for the power companies to secure the maximum benefit which this system of communication permits, it is necessary that all parties at interest should work together to secure the best possible coordination.

Report of the Overhead Systems Committee

HAROLD COLE, *Chairman*

THE following is a brief report of the accomplishments of the Overhead Systems Committee for the past year:

Loading and Strength of Overhead Lines

The research work on the strength of overhead lines, together with the collection of information on loading which may be expected in various localities, continues to be probably the most important activity of the Overhead Systems Committee. This work has been in progress for three years now under the Chairmanship of Mr. W. G. Kelley, and has advanced to the point where we may expect to obtain some tangible results in the near future.

The experimental line which was erected near Ann Arbor to study the effect of wind on aerial line structures has been subjected to a considerable number of wind storms throughout the past winter and a large amount of records have been secured which are now being tabulated and worked up in such a manner as to make it possible to readily interpret results. The data has been so far only on one size of wire (No. 6 A. W. G.) loaded with an equivalent of ½-inch of ice, on a weatherproof covered wire. This summer the wire will be changed to No. 0000, with an equivalent of ½-inch of ice on a bare conductor. It seems quite likely that another winter season will give a sufficient number of winds of high velocity to collect all of the data necessary to determine the effect of wind upon structures of the kind we have set up, namely, wood pole distribution lines. Whether the results obtained can be used to determine the effect upon longer span lines remains to be seen.

A start has also been made during the past year on a study of Wind Gusts and the contract with the University of Michigan was extended to include this study. Special anemometers are being developed for the recording of wind velocities, and it is the intention to obtain simultaneous readings of velocities along vertical and horizontal fronts, so as to be able to determine the extent of gusts of high velocity which occur at any one time, and in general give a more accurate idea of the way each wind acts. The work which has already been done on the experimental line indicates that there is a considerable variation in wind velocities at different points at the same instant. In connection with this wind gust study it is proposed to erect a 260-foot steel tower on the same site as the experimental line for the purpose of obtaining the vertical variation in wind velocities.

The work of collecting information on storms involving both wind and ice loads has been carried on this year with much more satisfactory results than in the past. The assistance of the Geographic Divisions in carrying on the collection of this information has been productive of very good results, and the cooperation of the Weather Bureau stations has been very helpful. A considerable mass of this storm data is now in the hands of headquarters staff, and if this can be carried on for several more years it should be possible to draw up some general conclusions which would be very valuable.

The headquarters staff has also collected a great deal of information on the strength of existing overhead line structures by sending field men to various sections of the country. This method of collecting data also has the advantage of securing uniformly interpreted results which might not obtain if different individuals submitted reports.

Insulator Research

At the beginning of the present year a Subcommittee on Insulator Research was appointed under the Chairmanship of Mr. H. C. Sutton, to study the matter of the deterioration of high voltage porcelain insulators. This Subcommittee has had numerous meetings throughout the year, has visited many of the insulator factories and has talked to the engineers of various insulator manufacturers and college professors who have been doing research work on insulators. As a result of their investigations they are recommending the initiation of a research project to study the behavior of high voltage suspension type insulators under conditions which would accelerate the deterioration of porcelain. Because of the fact that the Engineering Department of Tufts College has developed very accurate instruments for measuring the dielectric losses, they are recommending that this work be done at that institution. Their hope is to increase the information as to the aging of high voltage porcelain and to develop a means of testing high voltage insulators so as to determine just exactly how much its insulating value has deteriorated. At the present time it is only possible to determine whether the insulator is totally unfit for service.

National Electrical Safety Code

The Committee has continued to stir up as much interest as possible in the National Electrical Safety Code with a view to being better prepared for securing the best possible results in the next revision of the Code. The interest of the Geographic Divisions has been solicited in this matter and their cooperation has been, in general, very gratifying. Nearly all of the Divisions have designated one of their members to cooperate with the Subcommittee of the Overhead Systems Committee, under the Chairmanship of Mr. E. J. Amberg, which is carrying on this work.

It is also the intention of Mr. Amberg's committee to start immediately on a Code of Principles which should govern the safe construction of overhead lines in all situations, and it is hoped that when the revision of the National Electrical Safety Code is made, it will be possible to obtain a Code which is much more nearly a Code of Principles and not so much a detailed specification for construction of lines.

Marking and Lighting of Transmission Lines

A subcommittee was formed early in this year under the Chairmanship of Mr. O. H. Bundy, to study methods of marking and lighting transmission lines so as to be able to recommend the best means of doing this in case it becomes necessary for member companies to undertake this work. Considerable information has been collected on this subject and a report will be prepared in the near future which will indicate where the best information can be obtained on this subject. It is felt, however, that power companies will not be required to mark or light transmission line structures except where they are located in the vicinity of airports, and that, in general, the expense of such lighting should be borne by the Government and not by the power company.

Committee Reorganization

Reorganization of the Overhead Systems Committee was put into effect the first of this year, and as now organized the Committee has four major subcommittees, namely — Distribution Lines Subcommittee, Transmission Lines Subcommittee, Materials and Equipment Subcommittee and Safety Rules Subcommittee. Each of these major subcommittees has a number of subcommittees to investigate particular subjects coming under their scope. In addition to these, there are two special subcommittees on Loading and Strength of Overhead Lines and Railroad crossings. Another improvement in the organization was the establishment of an Executive Committee which has held five meetings during the year, has relieved the main Committee of a considerable amount of detail work and has promoted prompt action on the part of the main Committee on all important questions of policy.

Railroad Crossings

A special subcommittee was appointed on this subject under the chairmanship of Mr. J. C. Martin at the end of last year. Since that time the subcommittee has made contacts with the representatives of the American Railway Association, has had a joint meeting with a subcommittee of their organization, and has started the formulation of a set of principles governing the construction of wire crossings over railroads.

Other Activities

The program of the meetings for the past year was designed to emphasize certain important developments in the industry which concern overhead line construction. The following is a list of the subjects to which special attention was devoted:

Preservative Treatment of Wood Poles—A talk was given on this subject describing the new method of treatment developed by the Western Union Telegraph Company called the Zinc Meta-Arsenite Treatment, at the Philadelphia meeting. Another talk on the subject of preservative treatment of pine poles was given at the Memphis meeting.

Construction and Operation of High Voltage Lines—Three expressly prepared talks were presented on High Voltage Transmission Lines, one at the Philadelphia meeting describing the Construction and Operation of the 220 kv. Conowingo Line and two at the Memphis meeting describing the methods of construction used on two different lines in the Middle West.

Rural Lines—At the Pittsburgh meeting, five specially prepared papers were given describing the methods of construction and practices followed in connection with the construction and operation of rural electric service lines.

Highway Lighting—At the Pittsburgh meeting three prepared talks were presented on the subject of Highway Lighting, which also brought out the relation of highway lighting to rural electrification. Considerable interest was shown in this report on an apparently neglected source of revenue for central stations.

Radio Interference from High Voltage Insulators.—A general discussion of this problem, arranged in cooperation with the Inductive Coordination Committee, was arranged for the Philadelphia meeting, and the representatives of various insulator manufacturers were invited to be present.

Service Restoration—At the Memphis meeting a very interesting group of papers were presented describing the methods of service restoration used by various large operating companies. This will be made the subject of a serial report.

Lighting Surge Investigation—Mr. F. W. Peek, Jr., of the General Electric Company, gave a very valuable and instructive talk on the results of investigations by his Company, to the members of the Overhead Systems Committee and others attending the Memphis meeting.

Report of the Meter Committee

E. E. Hill, *Chairman*

DURING the administrative year, 1928-1929, the Meter Committee consisted of 45 members. The membership was composed, as usual, of subcommittee chairmen, members at large, and Geographic Division representatives.

Cooperation with Manufacturers.

The general activities of this subcommittee have resulted in the further improvement by manufacturers of the accuracy of watthour meters, particularly at overloads; the completion of the development of polyphase watthour meters with bottom connected terminal chambers; the improvement in the accuracy and insulation of instrument transformers; and the development of a 2½ ampere meter for use with instrument transformers, which will result in measurements of greater accuracy. The committee has also arranged for the standardization of nameplate voltage ratings of watthour meters.

Correspondence Course for Electrical Metermen

The manuscript for the Correspondence Course for Electrical Metermen was completed during the summer of 1928 and was transmitted to the Educational Committee. The Educational Committee has succeeded in having printed at this time, most of the manuscript and we are advised by them that 912 copies of the course have been sold as of May 1, 1929. Many utilities are planning to use the course in their educational work for the training of their metermen.

Short Courses for Electrical Metermen

Mr. E. A. LeFever, Chairman of the Educational and Publicity subcommittee, has been active in handling this matter, as reflected by the number of short courses given in the several Geographic Divisions.

In addition to the 25 courses mentioned under Geographic Division reports, two courses were given in the Middle Atlantic Division, where no Meter Committee exists. These two courses were given at the Johns Hopkins University and the Virginia Polytechnic Institute.

Handbook for Electrical Metermen

The sale of the Handbook for Electrical Metermen has been proceeding normally.

Contact with the Accident Prevention Committee

The Meter Committee has worked with the Accident Prevention Committee in the matter of accident prevention and has prepared a review of the work related to accident prevention which has been done by Meter Committees of the National Electric Light Association in the past. We have also considered with the Accident Prevention Committee the matter of improvement in rubber gloves.

Contact with Regulatory Bodies

The utilities in various States have been supplied with information which enabled them to prepare requests to the regulatory bodies for the extension of periodic test intervals.

Outdoor Metering

There has been considerable discussion recently regarding outdoor metering. At the Memphis meeting the following statement was adopted as expressing the opinion of the National Meter Committee on the subject of outdoor metering:

> "For many years meters have been installed outdoors in localities where climatic and operating conditions made it feasible and desirable. Outdoor metering has also been adopted in rural communities and other more or less inaccessible locations where meter reading is difficult.
>
> "Prior to the development of the temperature compensated meters such practice

was not recommended in localities having wide ranges of temperature, but, with the modern temperature compensated meters, outdoor metering is entirely practicable wherever local conditions may warrant it. Such condition would in general obtain as follows:

"a. Rural line extensions.

"b. Summer resorts and transiently occupied homes.

"c. Places difficult of access.

"d. All locations where climatic and operating conditions make it feasible and desirable.

"The extension of the practice of outdoor metering should be governed by the economics involved. The Meter Committee, N. E. L. A., recommends that all manufacturers of outdoor meters or metering equipment conform to uniform standards of construction developed with the cooperation of the National Meter Committee."

Test Facilities in Terminal Chambers of Meters

The matter of incorporating test facilities in the terminal chambers of meters was discussed at the Memphis meeting and again at the Swampscott meeting. At the latter meeting the following statement was adopted as expressing the opinion of the National Meter Committee on this subject:

"(a) The test facilities should be included in the meter terminal chamber and not provided by the use of an auxiliary device.

"(b) There is no objection, if necessary, to increasing the depth of the terminal chamber, but the width and height dimensions as standardized should not be changed.

"(c) Consideration should be given to the possibility of constructing the terminal chamber in such a manner that the meter could be fitted directly in a conduit line.

"(d) The sequence of connections at the meter chamber should not be changed.

"On motion by Mr. Wadsworth, seconded by Mr. Currier, it was agreed that the manufacturers through Mr. W. H. Pratt of the General Electric Company should be requested to consider the matter of the production of a watt-hour meter with test facilities in the terminal chamber.

"It is the belief of the Committee that joint consideration of the problem is the best method to pursue in order that the final product may meet the varying ideas of the manufacturers and the users."

Sequence of Meter and Service Apparatus Connection

The following resolution was adopted at the Swampscott meeting of the Meter Committee:

"RESOLVED: That it is the consensus of opinion of the National Meter Committee that the National Electrical Code should permit the following sequences of service connections:

"(a) Meter—Service Switch—Fuse

"(b) Meter—Fuse—Service Switch

"(c) Service Switch—Meter—Fuse; and further that the National Electrical Code should not necessarily require the physical location of the fuse in the combined service switch and meter equipment. And further, that the meter and service switch and fuses need not necessarily be installed as a unit."

Completed Reports

During the Committee Year 1928-1929, five (5) serial report and two (2) code test reports have been published as discussed below:

1. Serial report entitled "State Laws Relating to Theft of Electric Current," N.E.L.A. Pub. 289-7).

The purpose of this serial report is to satisfy frequent requests for information concerning State laws relative to the theft of electric current. This report was compiled by the General Counsel for the Association, at the suggestion of the Meter Committee, Engineering National Section, N. E. L. A. It comprises the text of current laws of the several States in the Union and the Distric of Columbia, together with pertinent comments from court and commission decisions in leading cases. Although the Committee's primary interest is in laws relating to theft of electric current, enactments and opinions concerning the theft of other public utility service have also been included.

2. Serial report entitled "Low Tension Metering Installations." (N. E. L. A. Pub. 289-39).

The purpose of this serial report is to present the modern trend of low tension metering installation practice. The report points out that the trend of modern installation practice is to provide metal inclosures for all service boxes and metering equipment between companies' mains and the load side of meters. This is generally accomplished by inclosing the service wires in metal conduit installed so as to eliminate condulets and pull boxes, and inclosing the main switch, fuses, meter terminals, test facilities and connections in metal boxes or cabinets.

3. Serial report entitled "Summary of Public Utility Rules and Regulations for Electricity Meters." (N.E.L.A Pub. 289-40).

The purpose of this report is to show clearly the similarities and dissimilarities in the service rules so far adopted by State Commissions in the various States in the Union and the District of Columbia. Such rules and regulations have been adopted in twenty-one States and the District of Columbia. It is believed that this report will fill the needs of individuals interested in meters, and company executives throughout the country in studying these rules and regulations with a view of ultimately eliminating all existing differences applying to the same subject. The ultimate aim of the Meter Committee is, of course, to see the rules in all States standardized.

4. Serial report entitled "New Developments in Electrical Measuring Devices." (N.E.L.A. Pub. 289-47).

The purpose of this report is to bring to the attention of those interested the results of a recent survey made by the Meter Committee. This Serial Report is particularly of interest because during the last year or two important changes have been made in the design of watt-hour meters to improve their operating characteristics, particularly as applies to sustained accuracy at high overloads. The report also includes recent developments in demand meters, totalizing meters, curve drawing instruments and other electrical measuring devices.

5. Serial report entitled "New Developments in Auxiliary Testing Equipment." (N.E.L.A. Pub. 289-57).

The purpose of this report is to bring to the attention of those interested the results of a recent survey made by the Meter Committee. Realizing that many utilities have developed and built for their own use, many pieces of apparatus which may be of interest and benefit to others, a special effort was made to collect such material for this Serial Report. In addition, auxiliary equipment recently developed and put on the market by the several manufacturers have been discussed in this report.

6. Code Test Reports.

The results of Code Tests made on recent type meters of two manufacturers were published in the form of mimeographed reports for distribution to the Meter Committee membership. This type of report is prepared in comparatively limited number, as it is of value to the metermen only, whereas Serial Reports find a wider circulation and use.

Proposed Reports

In addition, the three major subcommittees have submitted the following tentative reports for final consideration by the whole committee.

(1) A Study of Meter Record Systems for Future Dating of Tests.

It is the purpose of this report to describe systems followed by utilities of small, medium and large size (as measured by the number of meters in service) for issuing test cards in accordance with a schedule prescribed by the utilities themselves, or by a regulatory body.

(2) A Study of Two Rate Metering.

It is believed that the Committee should compile available information and technical data regarding metering schemes which can be applied where energy is sold to a single customer at two different rates. Energy sold for refrigeration and heating can probably be sold at rates different from those which have been established for lighting and power loads. One of the major problems in the application of such rates, is the problem of metering.

(3) Retest and Inspection of Electrician's Rubber Gloves.

This report has been prepared to acquaint those interested with the methods used in retesting and inspecting rubber gloves.

(4) Watthour Meter Lubrication.

A continued study has been made of watthour meter lubrication and the results of this study will be included in the report.

(5) Accident Prevention.

A report which covers the past activities of the Meter Committee toward the prevention of accidents, has been prepared. It is believed that the report is of value as it presents a review of the Committee's activities during the past decade or so, and will afford operating men an opportunity to determine whether or not they are taking all of the necessary precautions, outlined at various times, to insure the safe conduct of their work. This is not proposed as a Serial Report, but as a Mimeographed Report to be circulated among the membership of the Meter Committee.

(6) Maintenance of Maximum Demand Meters.

Technical information and operating procedures related to the maintenance of demand meters have been collected. Reports of this character are issued periodically and later form a basis for material to be included in the Handbook for Electrical Metermen.

(7) Meter Testing Methods Which Produce the Greatest Number of Tests Per Day Consistent with Accuracy.

Maintenance expense for watthour meters amounts to a considerable sum of money. The Committee has been able to reduce these expenses materially, through the efforts of individual companies. The excellent work done by member companies in improving watthour meter performance has led regulatory bodies in various States to extend the periodic test interval, at the request of individual utilities, and has resulted in this saving.

It is proposed in this report, to outline methods which may be pursued and result in an increase in the number of tests performed by each tester, without loss in accuracy.

(8) Meter Department Organization.

With the changing conditions in the industry, the scope of many meter departments has been expanded to include other work than the testing of watthour meters. In many localities the installation of meters can be most economically carried on by the meter department. Metermen are found particularly fitted to conduct other routine testing operations such as tests and maintenance of relays, station instruments and domestic appliances of all kinds. This is proposed as a Mimeographed Report to be circulated among the membership of the Meter Committee, and for such other demand that may develop.

(9) High Tension Meter Installations.

A survey has been made to determine the practices of various member companies as regards high tension metering installations. This report was prepared to present the result of this survey, and to make recommendations wherever possible, to standardize equipment and methods for metering energy furnished at 1100 volts or more. The subject has been divided, as regards voltage rating, into three main sections, namely, 1100 to 6600 volts, 6600 to 66,000 volts and above 66,000 volts.

It is proposed to publish two serial reports dealing with this general subject. The first, dealing only with the selection of equipment and installation practices, and the second to consider the methods of test and maintenance of high tension meters and metering equipment.

(10) Test Procedure on Customers' Premises for A-C Watthour Meters

This report includes a number of rules and test procedures to be followed by meter testers on customers' premises. The information presented may be of use to some of the smaller companies, or some of the large holding companies operating a number of small companies for which it is desired to devise uniform rules and test procedures. Much of the data presented in this report is printed elsewhere, but for the above indicated purposes it has been deemed advisable to present this material in one pamphlet. This is proposed as a Mimeographed Report for distribution among the membership of the Meter Committee and for such other demand that may develop when it becomes known that such a pamphlet is available.

Work of the Geographic Divisions

One of the outstanding features of the year is what appears to be a great improvement in the organization and ability to produce work of the Geographic Division Meter Committees. As is often the case, work which is tangible, and can be described in a report of this character, is not necessarily the most important work which has been done.

Canadian Division

The Meter Committee, under the chairmanship of Mr. E. R. Spence of the Southern Canada Power Co., was recognized in this division as a representative body, competent to give advice in the matter of making rules and regulations within the provisions of the Electricity Inspection Act.

Much of this committee's time was expended in this important work in connection with the proposed government regulations.

Another activity was the consideration of the standardization of mounting bases for instrument transformers.

Eastern Division

This committee has undertaken to collect information and facts relating to the advisability and practicability of outdoor metering for residence installations. Another subject studied was demand meter records.

In addition, two short courses for metermen were given in this division at Syracuse University and the Drexel Institute.

The East Central Division Meter Committee has been active in the development of an oil for use on watthour meter jewel bearings.

The redesign of current and particularly potential transformers having better ratio accuracies and smaller phase angles was considered by it. The increase in the insulation of instrument transformers and the perfection of several types of demand meters were also discussed.

It has also assisted in the development of a bushing type transformer, suitable for use with high capacity oil circuit breakers to measure energy of transmission lines. It is in favor of the use of pilot lamps on the potential circuits of watthour meters because such lamps are a direct indication of the continuity of the potential circuit.

It has also studied the use of condensers as a means of correcting the effect of potential transformer phase angles upon meter registration.

In addition it has assisted in the production of a satisfactory type of power-directional relay for use in interconnection metering, and the standardization of the dimensions of current transformers.

Great Lakes Division

One of the major actions of this committee, was the establishment of four schools for electrical metermen in universities located in four States: Wisconsin, Michigan, Illinois and Indiana.

The committee has by test and investigation, with the cooperation of professors from two of the universities, found a satisfactory answer to the moot question of the difference between series, polyphase and single element method of testing polyphase watthour meters. The facts gathered would indicate that there is no practical difference between these three methods of test, provided the tests are properly made and the results are intelligently compared.

Middle West Division

A survey of the "as found" accuracy of watthour meter tests, made by the various utilities in the section, has been completed and the data are being tabulated and will be made a part of the Middle West Engineering Section report.

The committee also made a detailed study of metering combined single and polyphase loads on one watthour meter. This work was satisfactorily completed.

In addition, two short courses for metermen were given under the auspices of this committee at the Iowa State College and the Kansas State Agricultural College.

New England Division

Four short meter courses were sponsored: one in Maine, one in Massachusetts, one in Connecticut, and one in Vermont.

North Central Division

This committee succeeded in establishing the first meter school in the State of South Dakota. The school was held in the South Dakota College. Another school was held at the University of Minnesota.

Northwest Division

Among the many problems dealt with by this divisional committee are the following:

1. Realizing that safety work in meter testing is a very important item, this division has made a survey through a well conceived questionnaire to revive and stimulate safety ideas. Groups of questions were asked dealing with safety from the standpoint of (1) resuscitation and first aid methods; (2) operating methods; and (3) installation of safety devices and equipment.
2. Another subject given considerable attention by this committee was the calibration and use of rotating standards. The problem was handled by means of a questionnaire and resulted in the collection of considerable data. One definite tendency in this division is the calibration of rotating standards in the meter laboratory by men particularly assigned to this task, rather than by meter testers who use the standards in the field.
3. The subject of metering Neon sign loads was also discussed in detail by this committee.
4. The subject of metering large loads where the kilowatt hours at different steps of demand are required was also considered by this committee.
5. The subject of service entrance and meter loop requirements was discussed with a view of studying the various code requirements applying to service entrance and meter loops in small rural and suburban districts.

Pacific Coast Division

Three short courses were given under the direction of the Meter Committee: two in California, and one in Arizona.

New developments were investigated. Special tests and investigations of methods of measuring dielectric losses and determining sludging in transformer oils, were made. The effect of different wave forms on the accuracy of watthour meters was studied and reports were made.

Meter statistics were investigated.

The division recommends that the Meter Committee give more attention to the study and discussion of other electrical measuring devices, not confining all its time to the consideration of watthour meters.

Rocky Mountain Division

The Meter Committee in this division sponsored two short courses for metermen at the University of Colorado and the New Mexico College of Agriculture and Mechanical Arts.

Southeastern Division

The subjects listed below indicate the scope of the committee's activities:

1. A study of special metering, including kv-a hours, line loss, remote totalizing of demand, and I^2R metering.
2. Determination of the accuracy with which uncompensated meters may be tested with compensated standards.
3. Investigation and determination of the desirability of two rate metering as applied to the Southeast.

In addition, three short courses for metermen were given under the auspices of this committee at the Alabama Polytechnic Institute, the University of Florida and the North Carolina State College.

Southwestern Division

The work of the committee was centered about a study of current practices of operating companies with respect to metering procedure. Problems under consideration are:

1. Organization of Electric Meter Departments
2. Kv-a Rate and Metering
3. Primary Metering Practices—Outdoor
4. Fusing of Potential Transformers
5. Meter Service Switches
6. Demand Meter Installations and Maintenance
7. Standardization of Meter and Relay Testing Equipment
8. Testing Current Transformers

Three meter schools, one in Arkansas, one in Oklahoma, and one in Texas, were conducted. The desirability of establishing schools in Louisiana and Mississippi is being investigated.

Metropolitan New York Section

The following subjects were studied through five subcommittees:

1. The 2.5 ampere meter designed for use with instrument transformers.
2. Multi-element type DSW totalizing watthour meters for obtaining on a single meter the consumption of several feeders or machines.
3. Outdoor metering transformer units.
4. Various kinds of auxiliary equipment.
5. Phase-angle characteristics of type KF and type NA current transformers.
6. Correspondence Course for Electrical Metermen.

In connection with item No. 5, the possibility of dispensing with phase-angle determination on these transformers was discussed.

Work for the 1929-1930 Meter Committee

The following subjects should be given careful consideration by the incoming Meter Committee:

1. The development of a meter with which is included the necessary test facilities. This may be developed to have the test facilities wholly in the terminal chamber; partly in the terminal chamber, and partly in the meter; or the terminal chamber may be arranged to be fitted directly in a conduit line.
2. The development of a current transformer insulated for use on circuits not exceeding 250 volts between conductors, or 125 volts to ground. Such a transformer should be designed as small in physical dimensions as feasible. To make this possible its capacity may be limited to the burden of a single watthour meter. The ratio error should be limited to 1 per cent, and its phase angle should not be greater than 15 minutes.
3. Frequently the scope of the Meter Committee's activity is questioned. This occurs not only in National Meter Committee meetings, but is evidently also a subject of much discussion in the Geographic Division Meter Committees. Your chairman's personal opinion in this matter is that the charter of the committee is flexible enough to permit undertaking any task relating to measurement of electrical quantities, the installation of meters and related devices and the design of such apparatus.

   It is believed that the committee should not hesitate to act on a problem fearing that it may be outside of the scope of the committee.
4. The committee should carefully study installation methods. We have passed beyond the stage of using exclusively the so-called "meter service entrance switch." There are being developed equipment for the installation of meters in groups, and these developments should be carefully followed.
5. The possibility of reducing the number of sizes of meters manufactured and carried in stock by the utilities, should be given careful consideration.
6. The committee should consider with the manufacturers, methods that will make more difficult the tampering with registers. The construction of the register pointer as an integral part of the driving shaft would, if feasible, be a step in the proper direction.
7. A study of the performance of multi-element meters should be undertaken.
8. The possibility of placing limitations on the range of adjustments for watthour meters should be discussed with the manufacturers.

Report of the Underground Systems Committee

J. W. SYLVESTER, *Chairman*

HEREWITH is presented a brief report of the activities of the Underground Systems Committee, Engineering National Section, N. E. L. A., for the administrative year, 1928-29.

The meetings, of which three were held, in October, 1928 in Philadelphia, in January, 1929 in Pittsburgh, and in March, 1929 in Memphis, were exceedingly interesting as evidenced by the large sustained attendance. This varied from 96 in Philadelphia to 60 in Memphis, an average of 74 for the six sessions of the meetings.

The reports of the standing subcommittees, prepared and distributed in advance of the meetings to stimulate discussion, have been abstracted and are given below:

Cable Sheath Damage and Protection.

The arc-proofing of cables in manholes has become a standard practice and while there is no general uniformity relative to the material used for this purpose, all of the companies are generally satisfied with results that they are securing from their present practices. The second part of the report was given up entirely to a description of sheath corrosion encountered in Philadelphia within the past two years on their single conductor 75kv. cable. While definite conclusions have not been reached, indications are that this condition has been produced by chemical reaction of the green concrete aggravated by a combination of sheath and stray railway currents. In view of the fact that similar kinds of corrosion have been found by other companies on cables in other kinds of ducts than concrete and that cement lined and stone ducts have been in extensive use for many years without corrosive effects on the lead cables, it is evident that the corrosion found in Philadelphia is not inherent in concrete ducts.

Conduit and Manhole Temperatures.

The report covers in a broad and thorough manner the calculation of cable ratings, the constants used in such calculation, the method and records used in checking operating temperatures and underground transformer vault ventilation.

Cable Installation.

This report touched on installation of long cable sections, aerial cable, buried cable, the protecting of cable risers, an outline of an economic underground distribution system and an insulated pothead support. The economic feature of the secondary distribution system described was accomplished by the use of rubber insulated, unleaded cable on open wiring in the manholes with the same type of secondary service cables. Successful installations of cable sections approximately 1000 ft. in length were described. The pulling stresses on these long lengths have not exceeded the limits that the cable manufacturers and the operating companies have determined by tests are injurious to the cable insulation.

A-C Networks.

This report covered compilation of answers to a questionnaire covering the operating practices and experiences of the companies which have installed a-c networks within the past few years. Special consideration was given in this report to the burning off of secondary faults. From the operating experiences of the companies replying to the questionnaire, little difficulty has been experienced in burning off faults on secondary systems where the mains were tied in solidly. Most of the companies are using single conductor cables on their secondary systems.

Cable Joint Design and Construction.

Among the most important points brought out were the trends, along the following lines, pertaining to high voltage joints:

1. A decided preference for varnished cambric tape.
2. Plastic compounds above 20,000 volts.
3. Electrostatic shielding.
4. Stepping of insulation instead of pencilling.

The other subjects dealt with in the report were standardization of copper connectors, insulating sleeve and sheath bonding, lightning protection and a new design of splices and terminals.

Impregnated Paper Insulated Cable Research.

An outline of the status, duties and activities of this subcommittee, which is attached to the Power Transmission and Distribution Committee, A. I. E. E., High Tension Cable Committee, A. E. I. C., and Underground Systems Committee, N. E. L. A., was presented to and approved by the Underground Systems Committee.

The report of this subcommittee gives an outline of the researches which are being sponsored by the subcommittee, as well as those which are being conducted by the member companies, by the manufacturers and by the Electrical Testing Laboratories.

This extensive activity on the part of the industry, seemingly confirmed by the operating results of the past few years, lead to the conclusion that progress in the art is being made.

Inspection and Testing of Cables.

The report indicated in general a continued trend in the direction of improvement: the percentage of deficiency continues to decrease; dielectric strength so far as short time puncture tests are a measure is little higher than last year; insulation resistance, power factor and ionization factor are distinctly improving. Research activities in this field are investigations of the "nature of cable deterioration which finally results in failure, the causes of such deterioration and the development of methods of telling beforehand whether or not cable is going to be satisfactory."

Cable Operation.

This report covers the cable operation experiences for the year 1928 and indicates a decided trend upward in the operation of cables, joints and potheads. The improvement is more pronounced in cables operating at 20 kv. and above. Cable failures due to internal causes during the first and second years of operation have decreased markedly. Over two-thirds of the causes of cable failures are external, probably half of which could be overcome by greater care upon the part of the operating companies. No failures occurred in oil-filled single conductor and three conductor cables. Single conductor cable shows the lowest rate of failure due to internal causes, followed by three conductor shielded and three conductor belted.

Conduit and Manhole Construction.

This report described a number of construction jobs of an unusual character which have been carried out successfully by members of the subcommittee.

Conduit was laid under a canal in one case and on a bridge structure constructed over a ravine, to be occupied later by a sewer and eventually filled in to form a boulevard, in another.

An unusually congested situation making a difficult problem for conduit installation in the vicinity of a substation was successfully solved.

A novel application of the use of "well points" for draining wet sub-surface soils during conduit and manhole construction was effectively accomplished.

The construction of transformer manholes, which must be built under exceedingly bad soil conditions and the methods adopted to reduce annoyance to the public and property owners during such construction, were described at length.

A "Standardization of Fittings for Manhole Equipment" Subcommittee was formed for the purpose as indicated in its title.

A new development in the line of

three conductor 33 kv. oil filled cable was presented by one of the manufacturers. This included not only the theoretical side of the question, but the construction problems in connection with a recent installation in Chicago, the purpose of which is to "determine whether some of the advantages of the 132 kv. oil-filled cable can be applied to three conductor cable" for ultimate use at 66,000 volts.

A well illustrated presentation of the tests made by the Commonwealth Edison Company on the expansion and contraction of cables in oblong and octagonal-shaped manholes was made and the conclusions reached from these tests indicated that the former type, where the conduits enter the manhole at diagonally opposite corners, is preferable to the latter.

Underground Systems Reference Book.

During the past year great progress has been made in the preparation of the manuscript of the Underground Systems Reference Book. It should be the last word on matters pertaining to design, construction, operation and maintenance of underground installations as the most prominent men in their respective fields have been voluntarily devoting their time to the preparation of this reference work.

Earth Temperatures.

A report supplementary to the report of the subcommittee on "Conduit and Manhole Temperatures" entitled "Earth Temperatures" was presented at the Memphis meeting. This report covers in a very thorough manner the results obtained by the various subcommittee members throughout the country. The effect of ground temperature on cable ratings will bear a very important part in studies of this nature. Various methods of measuring earth temperatures are discussed as well as relations between air and earth temperatures, the time lag which occurs between the two, and the results which may be expected from various elements influencing earth temperatures are set forth.

Noise Being Studied by Joint Committee on Development and Research

THE Dictionary says "noise" in acoustics is the confused sound obtained by a number of discordant vibrations. This definition does not very closely conform to the sound that is induced in a telephone circuit by a nearby power circuit and called "noise" as the induced noise consists of only fundamental sound and its harmonics. Such induced "noise" may cause interference with the transmission of speech over telephone circuits and for this reason has been included in the program of the Joint General Committee.

This work has been assigned to Project 4* and involves a study of the nature and the effects of the noise, while the other projects are concerned with causes and remedies. A knowledge of the nature of noise in telephones is essential to a complete study of causes, and remedial work can progress more intelligently when the effects of noise are known.

Analyses of the power line currents and voltages show that besides the fundamental frequency component which carries the bulk of the power, there are a multitude of harmonic components which are the ones that cause induced noise in paralleling telephone lines. Observations made on telephone lines with an analyzer indicate the amount of noise which is due to each frequency component of current induced in the telephone line. If these data are compared with the frequency analysis obtained on the paralleling power line, noise arising from frequency not due to this exposure will be indicated. The data will also give a quantitative relation between power line harmonic currents and the amount of noise each cause on the telephone line. The results of this work are not yet ready for presentation.

Noise exists in the telephone receiver because currents, induced somewhere on the line, flow to the termination and through the receiver. These currents are variable in character. They are usually produced by many sources along the line, some of which are steady while others exist intermittently. The resultant noise current is an exceedingly complex one, usually made up of frequency components from 60 to 3000 or 4000 cycles per second. The components are for the most part odd harmonics of 60 cycle fundamental, but even harmonics or harmonic components, not multiples, of 60 are not uncommon.

In order to study the nature of noise on open-wire toll circuits, a survey covering measurements on several hundred such circuits was made. Tests were conducted in the large toll center of New York, Chicago, St. Louis, Atlanta, Pittsburgh and Cincinnati, so that representative material might be obtained.

In this survey each line noise was analyzed into its frequency make-up and charts were prepared showing the magnitude of each component present in the noise. The charts gave a visual picture of what frequencies were contained in the composite noise and in what magnitudes the currents were present, but still were not reliable pictures of noise. The telephone receiver is discriminatory in the way it responds to currents of various frequencies, the maximum response occuring in the neighborhood of 1000 cycles. The various magnitudes of noise currents must then be weighed according to the receiver response before an accurate picture of the acoustic pressure output can be obtained. Furthermore, the human ear does not respond equally for the same pressure input at different frequencies. It requires a pressure about five times as great for the low pitched note of 128 cycles as for the note of 512 cycles, to give the same loudness sensation at ordinary noise volume. The acoustic pressure outputs of the receiver must then be weighted according to the response of the ear before the charts of noise currents can finally be translated into noise.

Several line noises representing various selected types were recorded phonographically. The use of these records in articulation tests is explained later in this article.

The noise which comes in on the line is not the only source of noise interference encountered when telephoning. The noise in the room in which the conversation is being held also makes understanding more difficult. Room noise which affects telephone reception is that which leaks around the receiver cap and enters the covered car, and that which is picked up by the telephone transmitter and is carried electrically around into the receiver. In the latter case the so-called "side tone" enters the ear as part of the received sound.

A survey was conducted to study the nature of room noise. Apparatus was designed which would "pick up" and indicate the magnitude of the room noise and also give a rough measurement of its frequency composition. Tests were made in 300 business and residence locations under summer and winter conditions. Measurements were made in towns of various sizes from the largest to the smallest at various times of day and evening. Residences varied from apartments on busy city streets to quiet homes in the suburbs. The business locations included various types of establishments which were grouped under the following four headings: stores—wholesale and retail, business offices, manufactories and public places. The relative number of measurements made in any one class of location depended upon the relative number of telephone calls known to be transmitted to or from such a class.

---

*Of the Joint Subcommittee on Development and Research of the Bell Telephone System and the National Electric Light Association.

Room noises which were found to be representative of residential and business locations are being recorded phonographically and made available for further tests.

The work of Project 4 in the immediate future will be to conduct a series of articulation tests to aid in determining the degradation of telephone service caused by room and line noise. It is planned to set up in a large room, complete telephone circuits of the commercial type, over which testers will call a series of sentences. In each of these sentences one of the words will be replaced by a syllable which is different for each sentence. At the receiving end of the circuit several receivers will be provided to permit simultaneous listening by several persons who will be situated in a sound proof booth. Each of these observers will write down the word or syllable which he thinks he has heard. The per cent of the total observations made, which have been recorded correctly will be taken as the articulation of the circuit. Several thousand tests will be made before an attempt is made to give out a summary of the results. During these tests the noises selected to represent the various types of line noise, will be introduced into the telephone circuit by using an electrical pick-up with the phonograph records of the noise, the volume being controlled by a vacuum tube amplifier and proper attenuators. The selected typical room noises will similarly be "picked-up" electrically from the records, amplified and introduced into the listening booth through high quality loud speakers. By introducing only line noise or only room noise, or a combination of both, the relative importance of each can be determined. The various types of line and room noises can be listed in the order of their degrading effects so that it will be known which kinds of noises can be permitted and which, so far as practicable, should be eliminated. When the effects on articulation of various types of noises are known an effort will be made to relate these effects to the magnitude of the noise as given by various measuring devices. It is hoped that a device can be developed by which, with the aid of the articulation data, the effects on intelligibility of a noise can be approximated by a single measurement on the line.

These are some of the ways in which the articulation tests and the study of noise in general can be used in solving a part of the big problem, inductive coordination.

In connection with the wave-shape survey of Project 5* noise measurements have been made on telephone circuits which parallel power circuits. Such tests determine under actual operating conditions the effect of various power line wave-shape on telephone subscriber lines of the different types. The following operating telephone companies have cooperated with the project committee in this work:

New England Telephone & Telegraph Co
Southern New England Telephone Co.
New York Telephone Co.
Southern Bell Telephone Co.
Chesapeake and Potomac Telephone Co.
Illinois Bell Telephone Co.
Northwestern Bell Telephone Co.
Southwestern Bell Telephone Co.
New Jersey Bell Telephone Co.
Ohio Bell Telephone Co.
Michigan Bell Telephone Co.
Bell Telephone Company of Pennsylvania.

---

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Pacific Coast Convention

THE thirteenth annual convention of the Pacific Coast Electrical Association, was held at Del Monte, Cal., June 19-22 with an attendance of 585 delegates. A feature of the convention was the talking-motion picture "highlights" of the Atlantic City National Convention. Through this medium also President M. S. Sloan of the National Association, who was unable to attend the convention in person, delivered a message to the West Coast Association. Likewise Thomas A. Edison was heard speaking from his home, Sir Ernest Benn spoke from London on the superiority of private enterprise, and Dr. Irving Langmuir of the General Electric Co., delivered a lecture on atomic hydrogen.

President Sloan emphasized the necessity of central-station companies concentrating on the domestic market, pointing out that commercial men have not fully "sold" the American home on the benefits of electricity. Rate structures are not yet right and a real inducement rate is needed, he declared.

Vice-President J. F. Owens, who attended the convention in person, made an excellent address at the opening session on the theme of human values in business. He pointed out that great energy has been given to the material aspects of the light and power business in the past and that now the industry must devote its attention to its human aspects.

In his presidential address P. M. Downing stressed the necessity for greater efficiency in all departments in order that rates may still further be reduced and electric service may become more widely and extensively used.

At the one meeting of the Commercial Section Chairman J. F. Pollard gave a résumé of notable accomplishments by the section in the past year. They include a handbook for agricultural power salesmen which will be distributed throughout the country. The commercial organization of the Central Arizona Light & Power Co. and a group plan for selling three major appliances—range, water heater and refrigerator—were described by A. F. Moriarty.

A talk on the purpose of and plans for "Light's Golden Jubilee" was made by H. M. Crawford. In an address on "Psychological Merchandising," A. Edwin Fein said that electrical merchandising managers should take advantage of the fact that health and food preservation are foremost in the public mind to push the sale of electric ranges and refrigerators. Results of a careful study of Diesel engine operating costs and competition with central station service were presented by W. K. Chawner.

Chairman N. B. Hinson of the Engineering Section reported at length on its accomplishments. Two valuable papers, one on improvements in distribution practice by D. K. Blake and one on metal-clad switch gear by A. W. Copley, filled out an afternoon session.

Addresses and special features were included in general sessions Thursday, Friday and Saturday. Several skits and playlets held the attention of the audience.

At the concluding general meeting Saturday morning, Paul S. Clapp, managing director, N. E. L. A., declared that the industry is making real progress toward complete electrification of America. Interconnection has made possible an ample supply of low-priced dependable power for industry, but there is a need for more aggressive large-scale business development, he asserted.

"Light" found its way into three features of the general sessions, and throughout the convention light and lighting effects played a dominant rôle. A novel and spectacular effect was produced when the beautiful Del Monte Hotel grounds were lighted for the first time on the evening of the opening day by a radio beam from a flying airplane.

Officers elected for the ensuing year for the Pacific Coast Association were: President, E. B. Criddle, Southern Sierras Power Co.; first vice-president, A. M. Frost, San Joaquin Light & Power Corporation; second vice-president, A. B. Day, Los Angeles Gas & Electric Corporation.

Wisconsin Association Convention

A PROPOSED revolutionary change in wiring, which, it was said, will save people of this country in excess of $4,000,000 each year, was one of the most important matters discussed at the Electric Section convention of the Wisconsin Utilities Association held at Wausau, Wis., July 18 and 19. Edward Bennett, professor of electrical engineering at the University of Wisconsin, announced that he has developed a substitute for the present three-wire system of distribution, substituting the steel conduit itself for the grounded neutral wire. The first application of Professor Bennett's discovery will be made in the wiring system of the Mechanical Engineering Building at Madison.

Professor Bennett said that the great advantage of his proposed system is that the cost in conduit and wire will be approximately 20 per cent less than for the three-wire system. Reduction in labor costs, he said, will amount to approximately 15 per cent. Electrical loss will be substantially less than for the average building as now equipped, utilizing one copper wire to complete the circuit, but enclosing it in the steel conduit for mechanical protection.

The convention was held in conjunction with Wausau's "Light's Golden Jubilee" celebration. Special sound films of the N.E.L.A. convention and talking pictures of N.E.L.A. convention speakers were shown.

Tom C. Polk, executive secretary of the Great Lakes Division of the N.E.L.A., praised the state and national associations as being responsible for the fact that today the American people are "electrically minded."

Steps in the advance of rural electrification were described by E. R. Meacham of the Wisconsin Power & Light Company. The gradual but definite tendency toward general uniformity of the conditions under which farmers throughout the state may obtain service is most encouraging, he maintained. Farmers in Wisconsin are using about four times more electric service on the average than they used five years ago and are already employing electrical energy individually to a greater extent than the average city customer.

H. R. Huntley of the Wisconsin Telephone Company discussed some of the important factors which affect inductive coordination of power lines and telephone lines. His talk was accompanied by a demonstration which illustrated many of the points discussed, the apparatus used consisting of a miniature three-phase power line and a miniature telephone line.

E. H. Finkelnburg of the Mississippi Valley Public Service Company reported on radio interference and equipment to eliminate it; A. F. Frahm of the Northern States Power Company, retiring chairman of the section, discussed the radical utility measures now before the Wisconsin Senate; T. A. Brown of the Madison Gas & Electric Company reported for the underground system committee, and President G. W. Van Derzee of the Wisconsin Utilities Association defended proper publicity methods, saying that opposition to them came from men ignorant of what they were designed to teach.

A. L. Pond, as chairman of a special historical committee, reported that Henry Ford has definitely decided to reproduce the world's first commercial water-power plant, which was that installed at Appleton, Wis., in 1882, for permanent exhibition in the Ford Museum at Dearborn.

D. G. Evans of the Wisconsin Gas & Electric Company, Racine, who was vice-chairman of the section last year, was elected chairman. The new vice-chairman is E. J. Kallevang of the Wisconsin Power & Light Company, Madison.

Northwest Division Convention

WITH a registration of 750 delegates, the largest number in the history of Northwest conventions, the Northwest Electric Light & Power Association held its 22nd annual convention at Seattle, Wash., June 26-28.

Urging as one of the seven cardinal duties of the public utility industry a vigorous attack against the entry of government into private business, W. H. McGrath, vice-president, Puget Sound Power & Light Co., Seattle, stated, in the opening address of the convention, that government ownership was "constitutionally unsafe, politically unwise, economically unsound and competitively unfair." Franklin T. Griffith, president, Portland Electric Power Co., Portland, in his response, recommended a word of mouth campaign by every member of the industry to counteract unfair newspaper interpretations of the industry's acts, which represent the opinion of only a single man, the writer or editor. Pointing out that it is not the government itself which is interfering with business, but rather the demagogues who have won a place on the government payroll they must hold at any cost, R. M. Boykin, president of the association, in his annual address analyzed and pointed out some of the dangers of the Grange or District Power Bill, which will be voted on by the people of Washington in 1930.

Dr. Henry A. Burd, University of Washington, analyzed the public attitude toward the power companies, showing wherein this attitude is different than it is toward businesses which are not natural monopolies, and urged the intelligent application of sound advertising principles as one solution of bringing the public point of view into harmony with the industry's aims and purposes. Paul S. Clapp, managing director, N. E. L. A., stated the industry would be remiss in its duties to the public, to its investors and to itself if it did not continue to inform the public and to combat with full vigor the aggressions of government ownership advocates. The program of the first session concluded with talking-motion pictures showing the opening of the N. E. L. A. convention at Atlantic City, the address of President M. S. Sloan, greetings from Thomas A. Edison, and the discussion of privately vs. socially owned property by Sir Ernest Benn.

The second session, comprising parts of the accounting, commercial and engineering phases of the business, was featured by a talk by Prof. Karl E. Lieb, University of Washington, who made a plea for finding a measuring stick of efficient management other than the customary arithmetical average of earnings per kilowatt-hour. He declared that when such a measuring stick might be devised the public and the utility would both benefit from the increased efficiency which could then be effected. For the Commercial Section, Kenneth A. McIntyre, managing director, Society for Electrical Development, told how the society was organized to aid commercial development of all branches of the industry. The session concluded with the presentation of Insull Medals to Andrew J. Huling, Portland Electric Power Co., and L. E. Banks, Mountain States Power Co., and a first aid demonstration by the girls' team of the Portland Electric Power Co.

In reviewing the work of the Public Relations Section at the third session, W. H. Ude, The Washington Water Power Co., Spokane, pointed to the conduct of public speaking and essay contests as the principal features. Finals in two public speaking contests on "The Public Utility a Good Citizen," and "How Can I Best Serve Our Customers," formed an important part of the program, as did the presentation of prizes in the essay contest on "Pleasing Mr. and Mrs. Public." Norwood W. Brockett, director of public relations, Puget Sound Power & Light Co., credited the industry with laying before the public too much emphasis on the public relations problem with the result that the public has become suspicious of the industry's public relations activities. A playlet entitled "Front Page News," presented through the courtesy of the Pacific Coast Electrical Association, proved to be one of the outstanding features of this session. George E. Erb, former chairman of the Idaho Public Utilities Commission, Lewiston, Idaho, discussed maintaining amicable relations with the public. Closing the session in masterful fashion, J. F. Owens, vice-president, N. E. L. A., drew attention to the human values involved in the public contacts of the thousands of utility employees, and declared that the fine integrity, honesty and sincerity of these employees was the best safeguard of the future of the industry.

Boat Trip

The closing feature of the convention was an all day boat trip to Victoria, B. C., where the British Columbia Electric Railway Co., Ltd., acted as host to the delegates. The final session was held on the boat in which D. W. Proebstel, Portland Electric Power Co., Portland, chairman of the Engineering Section, reviewed the accomplishments of the Section, and D. K. Blake, General Electric Co., Schenectady, discussed the economics of distribution. A. Edwin Fein, New York City, also spoke on "Psychological Merchandising."

Officers elected for the ensuing year include: M. L. Hibbard, vice-president and general manager, Idaho Power Co., Boise, president, and M. W. Birkett, vice-president and general manager, The Washington Water Power Co., Spokane, vice-president. A. C. McMicken, general sales manager, Portland Electric Power Co., Portland, was elected to honorary membership in recognition of twenty-one years of active service to the association.

Michigan Association Convention

By WAYNE F. McMEANS

ALL agencies interested have been hard at work in Michigan solving the many problems surrounding real farm electrification. As a result of their combined activities, 10,000 farms in the State will receive electric service this year for the first time, and 1500 miles of lines will be built to serve them, leaders in this development asserted at the annual convention of the Michigan Electric Light Association, held at Mackinac Island, July 1 to 3. This year's growth in farm service will exceed the combined progress of the twenty preceding years.

Of immediate importance in making this expansion possible, questions of rates and cost of line construction were solved by several companies. The Detroit Edison Co. always has had in effect its standard city rate for farm service customers, and Consumers Power Co. recently adopted a like policy. No one pretends that, under present conditions, such rates show a profit. "The utilities of Michigan," Prof. H. J. Gallagher of Michigan State College told the convention, "have a broader perspective than the immediate dollar return on farm service investment, and through their willingness and desire to serve agriculture on a basis within the earning scope of the farmer will do more toward establishing a balance in agriculture than would any farm relief bill passed by Congress."

Matter of cost of rural extensions was carefully investigated, and while methods reported at the convention differed somewhat, two types of dependable rural line have been developed which are being built at a cost of $1,000 a mile. To reduce the cost to this amount, Fred W. Bagnall said, The Detroit Edison Co. employed steel cored, bare aluminum wire, 35 foot poles, machine hole diggers. Spans of 300 feet were obtained. To avoid tree trimming and future moving of poles for highway widening, the company now places poles well behind the tree line on private property, obtaining this permission before the line is built. Hi-Tenso BB wire, 30 foot poles, with spans of 250 feet, are being used by Consumers Power Co., according to F. W. Pollock of Stevens & Wood, Inc.

Twenty thousand farmers have been in actual contact with electric power equipment for farm use at demonstrations held at State College, demonstration farms, and the demonstration truck of the college, Professor Gallagher stated in his address. A change of attitude of the farmers toward farm electrification is noted by him. "This year they came, not with a suspicious attitude against the utilities and a derisive attitude against rural electrification, but with a clamoring for information as to the right practices to pursue."

Walter R. Carven, chairman of the local committee of farmers on the Mason-Dansville test line, presented graphically the difference farming with electricity has made.

"The enthusiasm with which the farmer is seeking electricity is not a passing fad," said Mr. Carven. "He wants it because he knows what it can do for him, and he will be found constantly adding new installations which will save him time and labor, leaving such time and labor for recreation or added production."

L. C. Moore, holder of the farm electrification fellowship at State College, told of research work to develop electric hay hoists, electric brooders, automatic chicken feeders and poultry house cleaners, and electric ventilation in poultry houses and barns.

Feasibility of off-peak electric water heaters was discussed by R. R. Clark, Consumers Power Co. The company is now conducting tests on two Swiss heaters of this type equipped with time switches, and although the heaters have been in service only a short time, Mr. Clark professed a belief that such hot water service would be useful to customers and profitable to the utility at a rate of one cent a kilowatt-hour.

E. M. Burd Stevens & Wood, Inc., presenting a paper on "Comparative Costs of Generating Electricity by Steam and Water Power," said that the local mill power project or other small water power rarely can be worked into the present day power system. The cost of developing a small power and tying it in with the up-to-date utility transmission system, is about the same for the creek that supplied the old grist mill as for a river ten times its size and yield in energy. Other papers given were: "Outdoor Meter Installations," by J. C. Langdell, Consumers Power Co., with discussions by W. A. Wadsworth, vice-president and general manager of Michigan Public Service Co., and A. S. Albright, The Detroit Edison Co.; "Building of Electric Power Lines and Trimming Trees Along State Highways," by Phelps Vogelsang, forester, State Highway Department; report of Women's Committee by Miss Skulda Baner, chairman.

President Pett, in his address, said that in recent criticisms of electric industry "the outstanding facts about our industry are lost sight of—namely, that in each year since 1890, with the exception of the war period, the average price for electricity for home use has decreased. With practically no exception, the attitude of Michigan newspapers is eminently fair toward public utilities," he said, "and member companies are enjoying the confidence of the communities they serve." Mr. Pett quoted figures showing that Michigan companies quite generally have adopted the inducement type of rates, encouraging greater use of energy for cooking, refrigeration and appliance uses in the home.

At a joint session with members of the Michigan Gas Association, W. J. Hagenah, vice-president of Byllesby Engineering & Management Corporation, spoke upon "Public Utility Regulation and Its Accomplishments." At no time, he said, have State regulatory commissions permitted rates yielding an unreasonable return on the fair value; and that the savings which have been effected in the cost of producing and distributing electrical energy have been transmitted to the public through the constant downward revision of rates.

Mrs. Siegel W. Judd, Grand Rapids, president of the Michigan League of Women Voters, in her address, said that increasing consideration of domestic rates and the extension of domestic use of power on the part of utility leaders was most encouraging. A. C. Marshall, chairman of the Michigan Committee on Public Utility Information, and vice-president and general manager of The Detroit Edison Co., declared that the Public Utility Information Bureau has acted, since its founding, as a central source of information on facts concerning gas and electric utilities, had disseminated such facts in legitimate and ethical ways, and that the bureau would be continued with the same policies with which it was started. A definite need for such information exists, he said, and the bureau is the best means for filling it. Arthur W. Stace, director of the committee, spoke on "Public Relations and Public Opinion."

Officers elected for the coming year are: President, E. L. Edwards, Lapeer, vice-president and general manager, Michigan Electric Power Co.; first vice-president, D. W. Hayes, Port Huron, district agent, The Detroit Edison Co.; second vice-president, D. E. Karn, Kalamazoo, district manager, Consumers Power Co.; secretary treasurer, Herbert Silvester, Ann Arbor, district agent, The Detroit Edison Co. Directors: Howard Pett, Jackson, district manager, Consumers Power Co.; G. W. Baldwin, Sault Ste. Marie, Edison Sault Electric Co.; R. Evans, Frankfort, secretary, Lower Peninsula Power Co.; H. W. Riley, Buchanan, manager, Indiana & Michigan Electric Co.; and D. E. Byerley, Adrian, vice-president and general manager, The Citizens Light & Power Co.

New Officers for Indiana Association

AT a meeting of the Board of Governors of the Indiana Public Utilities Association, held in Indianapolis, July 18, H. S. Morse, general manager of the Indianapolis Water Company, was elected president for the ensuing year. Thomas F. English, general manager of the Indiana & Michigan Electric Company, South Bend, was elected vice-president.

The members of the Board of Governors of the Indiana Public Utilities Association for the current year are: C. L. Kirk, vice-president and general manager of the Citizens' Gas Company, Indianapolis; F. J. Haas, vice-president of the Southern Indiana Gas & Electric Company, Evansville; C. H. Rottger, president of the Indiana Bell Telephone Company, Indianapolis; F. E. Bohn, president of the Home Telephone & Telegraph Company, Ft. Wayne; R. M. Feustel, president of the Indiana Electric Corporation, Ft. Wayne; A. W. Brady, receiver of the Union Traction Company of Indiana, Anderson; W. H. Durbin, general manager of the Terre Haute Water Works Corporation; N. A. Perry, president of the Indianapolis Power & Light Company, and Mr. Morse and Mr. English.

Empire State Association Meets in September

THE twenty-fifth annual meeting of the Empire State Gas & Electric Association will be held at Saranac Inn, Upper Saranac, N. Y., on September 19 and 20.

It is expected that over two hundred executives and department heads will attend the two-day session.

A fine program has been arranged for the two morning business sessions, each Section of the Association being represented by prominent speakers who will discuss problems in all departments of the business including electrical engineering, gas engineering, gas and electric commercial practices, women's activities, accident prevention, accounting and electric meter engineering.

A program of entertainment and recreation has also been arranged, consisting of a golf tournament for the men and women, boat rides, auto rides, with a banquet and president's reception on Thursday evening.

Power Survey for Middle West Division of N. E. L. A.

PROF. V. L. HOLLISTER of the University of Nebraska engineering faculty has been engaged by the Middle West Division of the National Electric Light Association to supervise a power survey that a committee has been working for weeks to outline. The survey will cover all power plants in the four States composing the division — Iowa, Kansas, Nebraska and Missouri — and the results will be published in loose-leaf form so that in the years following the data can be kept up to date.

The plans have been materially changed from the first announcement, but the general purpose will be so to record the electric properties in the district that all member companies can get a picture of them in their entirety and in detail. Its principal value will be to enable a company to know the possibilities of interconnection in its vicinity. If it needs more power, the data at hand will help materially in solving the problem of whether it can get energy more cheaply through interconnection than by generation. In addition to a directory of each town, the capacity output at peak load, the transmission-line capacity and the interconnecting points will be set down.

Thorne A. Browne, secretary for the division, who has assisted in the work, says that while other divisions have taken surveys, an entirely new idea is contained in this one which will give each operator complete facts from which he can draw his own conclusions and build his own plans. The data will be supplied by the companies. C. L. Kaar, Wichita, Kansas, Gas & Electric Company, represents Kansas and is chairman; G. O. Brown, Kansas City Power & Light Company, Missouri; F. A. Beatty, Des Moines Electric Light Company, Iowa; F. E. Smith, Nebraska Power Company, Nebraska, with A. E. Bettis, Kansas City Power & Light Company, an ex-officio member.

Future conventions and meetings of electrical and allied associations are listed on page 536

WOMEN'S COMMITTEE

MISS SARA HARRIS, *Chairman* MISS ISABELL DAVIE, *Secretary*

News Letter

By MRS. THELMA VAN NESS

Publicity Chairman

ANNOUNCEMENT has been made by Mr. Harry Reid, Chairman, Public Relations Section, of the appointment of Miss Sara Harris, Utica Gas & Electric Company, Utica, New York, as Chairman of the Women's Committee.

MISS HARRIS

Miss Harris has been with the Utica Gas & Electric Company in various capacities for a number of years, and now holds the position of Assistant Secretary of the Company. She is the only woman officer the Utica company has ever had.

Miss Harris has been active in Women's Committee work for five years. She served as Chairman of the Women's Section, Empire State Gas and Electric Association for two years; 1925 and 1926. She has been a member-at-large of the National Public Speaking Committee for two years and a member-at-large of the National Women's Committee for one year.

* * *

The Women's Committee of the Illinois Power Company at Springfield recently held a reception and open house. A large number of visitors responded to the invitations extended to the women of the city. Refreshments prepared during demonstrations of appliances were served to about two hundred people. A souvenir in the form of a recipe book containing the recipes of the refreshments served was given to each guest. The committee in charge of this affair consisted of Miss Edna Heermans, Chairman, Misses Margaret Troesch, Rose Frey, Sophia Rudin, Edna Wirth, Carrie Funk, Irene Ryan and Bertha Millard.

* * *

Miss Helen Bennett, Chicago, managing head of the Women's World Fair and first director of the Collegiate Bureau of Occupation for women was the speaker at the May luncheon meeting of the Hammond, Indiana Women's Committee of the Northern Indiana Public Service Company. Miss Grace A. Leslie, chairman of the committee, presided. Men employees of the district and officers of several Hammond Women's Clubs were guests at the meeting.

* * *

According to information in "The Wocompap," the Women's Committee of the Lake Superior District Power Company, through Mrs. Kevern and Miss Skulda Baner, assisted the Merchandising Department in putting on a cooking school at Hurley, Wis., before the Women's Club. There were about fifty people present. Miss Baner spoke on "The New Servant—Electricity." Mrs. Kevern assisted Miss Lerschen in the food demonstration.

* * *

The June meeting of the Illinois Northern Utilities Company Women's Committee at Dixon was devoted to safety and as the first number on the program, roll call was responded to by each girl giving a current event pertaining to safety. A series of papers on "Safety Practices in the Home" were given by Misses Opal Mossholder, Ingaletta Robertson and Mary Lou Downing, respectively. Mr. F. E. Crawford talked on the company's safety program, Miss Marjorie Bennett gave a very instructive talk and demonstration on first aid and the program was closed with a demonstration of the Prone Pressure Method of Resuscitation given by Misses Maryan Gonnerman and Leona Underwood. Miss Marie Lesage is chairman and Miss Helen Meeks is the secretary of this group.

The Women's Committee of the Huron (South Dakota) District, Northwestern Public Service Company, put on an electric range demonstration at their last meeting when the girls prepared dinner for twenty-six. A short program was enjoyed following the dinner. Several visitors from Mitchell attended the meeting.

* * *

Puget Sound Power & Light Company's Northern District Women's Committee, Bellingham, Washington, recently put on the playlet "Wanted, A Stenographer" at the annual birthday banquet of the Bellingham Business and Professional Women's Club. Some very eminent women of the State in club work were on the program as speakers and the banquet was quite a club event. There were about fifty-five persons in attendance.

* * *

The Seattle Women's Committee has developed its Glee Club into a "Song and Dance Act." The company has provided costumes. Instruction is being given the girls in the dancing work. This act has been given at a number of service clubs in the city in connection with publicity programs being put on by the company and has made a decided hit. Other acts are being worked out and it is expected to continue to feature this group of about ten members.

* * *

The Women's Committee of the Eastern Oregon Light & Power Company recently served hot waffles and cake at a meeting of the Wingville Grange, which was held about ten miles from Baker, Oregon. Four waffle irons were kept busy until everyone was served. A committee of five girls prepared and served the food and the Grange women complimented the girls upon the efficient manner in which the lunch was served.

* * *

The New England Division Women's Committee reports that Miss Elizabeth Ballantyne, secretary to Mr. W. S. Wyman, president of the Central Main Power Company, has been made president of the Augusta Business and Professional Women's Club. Miss Audrey Hanks, of the same company, was elected secretary. Miss Ballantyne attended the National Convention of this organization at Mackinac Island, Michigan.

Recently the women of the town of Winthrop, Maine, held a Better Homes Meeting. Seven women from the Central Maine Power Company, Augusta, served refreshments cooked on the grill, waffle iron and percolator. A representative from Landers, Frary & Clark demonstrated the electric range.

Following the installation of electric

ranges in an apartment house in Portland, Maine, by the Cumberland County Power & Light Company, a meeting of the Women's Committee was held at which the housewives were guests and the ranges were demonstrated.

* * *

The month of June marked the organization of four new Women's Committees in Michigan and Ohio properties of the National Electric Power Company, including the Michigan Public Service Company at Traverse City, the Michigan Electric Power Company at Lapeer and the Ohio Electric Power Company (Northern Division) at Ravenna and (Southern Division) at Sidney. Miss Greilick will have charge of the work at Traverse City, Miss Bertha Goetze, Bad Axe, Miss Holtsberry, Ravenna, and Miss Pauline Reick at Sidney. Mrs. Pearl W. Evans of the National Electric Power Company, New York, who is a member of the National Women's Committee, assisted at the organization meetings.

* * *

A recent number of *Northwestern Echoes* gives a report of a successful Women's Committee meeting at the convention of the North Central Division at Breezy Point, Minnesota. Mrs. Mabel Wilson, chairman, presided and a very interesting program was enjoyed.

* * *

The results of the essay contest, "Pleasing Mr. and Mrs. Public," conducted by the Women's Committee of the Northwest Electric Light and Power Association, have just been announced by the chairman of the Division, Mrs. Nell Laws. Following are the prize winners:

First Prize: Miss Billie Russell, Northwestern Electric Co., Portland.

Second Prize: Miss Margaret Brady, Portland Electric Power Co., Portland.

Third Prize: Miss Eleanor Emery, Grays Harbor Railway & Light Co., Aberdeen, Washington.

Fourth place was a tie between: Miss Marguerite M. Brunney, Idaho Power Co., Boise, Idaho, and Miss Liberta Gore, California Oregon Power Co., Medford, Oregon.

This contest was most successfully conducted and a number of very original essays were obtained.

* * *

Miss Lenore Tamiesie of the Northwestern Electric Company, Portland, Oregon, was chosen Queen of Rosaria and will preside over the beautiful rose festival which is held annually in the city of Portland, Oregon. Considerable interest is shown in the selection of a Queen for this festival and the Women's Committee of the Northwestern Electric Company is to be especially congratulated upon having one of its members chosen.

* * *

At the request of the Portland Realty Board and the United Artisans, the Portland Electric Power Company permitted one of its women employees to enter the Rose Festival Queen Contest sponsored by the clubs and endorsed by the company. The Women's Committee of the Portland Electric Power Company is rejoicing that their candidate, Miss Irene Martin, won a place as Princess of the Festival.

* * *

Miss Mary K. Walsh, Chairman, Women's Committee, The Washington Water Power Company, was in charge of the program planned for the Victory Dinner given by the Spokane Business and Professional Women's Club. This dinner was given in celebration of a "Radio Marathon" conducted by the Spokane Business and Professional Women's Club in which $1,300 was raised by the organization for its educational fund. Miss Janet Hodges and Miss Helen Brown, both members of the Women's Committee, The Washington Water Power Company, appeared on the dinner program.

* * *

Miss Esther Rockey, Chairman of the East Central Division Women's Committee, reports an interesting meeting in connection with the recent Division Convention held at Louisville, Ky. A feature of the program, at which Miss Rockey presided, was a debate on the subject, "Resolved that Electricity is more Beneficial to the City Woman than to the Farm Woman." Miss Helen McMillan and Miss Mary Forte spoke on the affirmative side of the question and Miss Martha Hunt and Miss Emma Gillespie championed the negative. The judges were: Mr. W. S. Vivian, Director of Public Relations, Middle West Utilities Co., Chicago, Mr. Charles B. Scott, Director, Bureau of Safety, Commonwealth Edison Co., Chicago and Mr. Tom C. Polk, Secretary of the Great Lakes Division, N. E. L. A. It was the decision of the judges that the negative side of the debate won on points made, while from the point of view of public speaking Miss Helen McMillan, of the affirmative side, was declared winner. Mr. Paul S. Clapp, Managing Director, N. E. L. A., addressed the meeting, following the debate, and Miss Julie Pailet, Chairman Women's Committee, Southwestern Division, New Orleans, La., brought a message from the utility women of the southland. Other speakers on the program included Miss Myrtle Weldon, State Leader, Home Demonstration Agents, University of Kentucky, Miss Beulah K. Yewell, Kentucky State Chairman, who read a paper by Miss Fern Snider, Home Service Director, Monongahela West Penn Public Service Company, Fairmont, West Virginia, and Mr. Martin J. Insull.

* * *

According to "Aurorean Club" bulletins—Northern Ohio Power & Light Company—The Women's Committee, under the direction of Edna D. Holloway, Chairman, has been holding some very interesting meetings. Recently the group made a trip to Cleveland to Nela Park, following which a contest was held for the best story of the trip and also another contest was held for the best talk to be given at the Women's Committee meeting following the trip. Every girl who made the trip was expected to give a short talk on whatever impressed her most.

* * *

A great many safety demonstrations have been given in Wisconsin. The Women's Committee of the Wisconsin Public Service Company has put on demonstrations in Chilton, Sheboygan, Reedsville, Green Bay, Plymouth, Manitowac, and Oakgrove, before a total of over three thousand persons. Organizations with which the girls worked included High Schools, Vocation Schools, Parent-Teacher Associations, Loyal Order of Moose, Y. W. C. A. classes, Red Cross Safety classes and Safety Schools. The Wisconsin Valley Electric Company Women's Committee gave two safety demonstrations in Wausau, one before the Parent-Teacher Association and the other the Lions Club, to a total of 134 people.

MAGAZINE ARTICLES

BELOW is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

What Executives Should Expect from Women's Committees

MISS SOPHIA MALICKI, retiring Chairman of the Women's Committee, in a talk directed to executives of member companies made before the Public Relations Session of the recent Atlantic City Convention, said:

"The Women's Committee of your Company should be able to do these things:

- Correct any untruths or misunderstandings they meet either in their work or in social contacts outside of working hours.
- Explain why a utility company differs in corporate structure and regulation from other companies women are dealing with.
- Explain the rates domestic customers are paying—not the top rate to which most customers and our enemies are accustomed to refer, frequently not allowing for the discount—but the average rate that home-owners pay over a month or a year. Many of our own people do not realize how low the average domestic rate is. Our women should tell to all they meet of the constant reduction of electrical rates.
- They should understand that cost of electricity is not the deterring influence to electrification of households; that they pay a negligible fraction of their household expenditures for all the uses of electricity in the home, not only lighting.
- They should be able to tell all women they meet of your company's aim for the very best service at lowest cost.
- They should have earned the recognition and respect of homemakers and their organizations in your community and they should be called on to cooperate in activities toward home and community betterment.
- Representatives of homemakers should be coming into the meetings of your Women's Committee where they will come to know you better, your organization and your principles.
- Your Women's Committee should be the recognized authority on household electrical equipment in your territories.
- They should be telling homemakers through the home service department and the entire women's group about electrical housekeeping and they should help to establish it in every home.
- They should discover the little, and to us frequently insignificant, misunderstandings of homemakers with your service, which so often are the root of real mischief to best service.
- They should be teaching resuscitation and first aid to women's groups and they should take their place in community safety activities.
- In a word, they should, through their education and abilities, be intelligent representatives of your company on all occasions and in all places.

"These are not theories; they are items of work actually being done in all sections of the country.

"If your group is not doing these things, go over your committee program with your chairman. Give it a little of your and your executive's interest and counsel that the work may follow more closely your policies and your belief of what it should be.

"There can be no industry with a more loyal woman personnel, one so eager to translate to the public its pride in the achievements of its industry and its responsibility in the social advance of this country.

"If it is possible for one group to develop to a degree where its chief executive considers the women's committee one of the most important influences in building understanding between the company and the women of the community, it is possible for all committees whose executives have the same interest and give the same support.

"Homemakers are adopting the statement, 'ask light and power women.' We cannot disappoint that expectation."

CORRESPONDENCE

To the Editor:

In my article, "The Philanthropy of Tree Clearance Programs," which appeared in the February issue of the Bulletin, I outlined, briefly, the contribution toward civic betterment which public utility companies have made in their programs of lessening service interference from shade tree growth.

Not only do such programs have this significance; to us they exemplify the utility's interpretation of "service" and are typical of the real tenor of privately-owned administrative policies.

Primarily, the public utilities ask and expect line clearance. This may be secured without retaining the facilities of a scientific organization and at a slightly smaller initial expense than is entailed when such are employed. With the same desire for scientific perfection which has characterized the research activities of their own organizations, public utilities have seen behind the apparently non-technical process of "cutting a limb off" in tree trimming operations. They have engaged organizations which have included as integral requirements of their training courses for workmen not only fundamental understanding of the principles of electrical transmission, but a comprehensive knowledge of the structure of trees, their time and rate of sap flow, relative brittleness of wood, water content, susceptibility to insect and disease attacks, and the other intricate phases of tree growth. The administrative hazard, in this case unskilled workmanship, is clearly recognized. Possibilities of its occurence are reduced to a negligible minimum by the privately-owned utility company's interpretation of service.

Perhaps, from our chilly pinnacle of scientific research in horticulture, we have not seen the ramifications of the Public vs. Private Ownership question. Again, using as a basis of judgment our particular relations with the utility and discounting to the scuppers such easily-mouthed words as "monopoly," "combine," etc., we may have arrived at a sane and reasoning conclusion. In our opinion, private ownership of the utilities rests its worth on this principle: no individual, no private organization, building for advancement socially, financially, and culturally, without protective governmental immunity from criticism, is satisfied with less than the best in the discharge of its economic function. Private ownership recognizes the fact that in order to survive and grow it must give its best. It must render service, complete in every sense of the word, unhampered by the dangers of inefficient management and stagnation of service improvement through political football, by changing policies of administration, or the striving for individual advancement through party machinations rather than by sheer merit.

I am writing this letter in my study under the soft, pleasant glow of an electric lamp. I have just tasted delicacies which have been preserved by electrical refrigeration. The radio will soon be giving the music and entertainment of countless artists. My home has been cleaned by electricity, my food cooked by it.

The moon is coming up over the nearby hills. Silhouetted against it are the wires which bring happiness to my home. These pass through a row of beautiful trees but there has been no mutilation of branches, no destruction of symmetry to make way for the passage of electricity. Back along the graceful strands, over hill and valley to the power source where men of clear minds, unhampered by the dread of political disfavor are giving their best to the end that homes shall be warm in winter cool in summer, send constant yellow gleams into the falling shadows, and have the world of song and drama, education and culture at instant command.

So much for our interpretation of service and our immature opinion on the question of private ownership. Perhaps it is nothing in the way of a contribution; it is, at least, our effort to give expression to a sincere feeling that credit should go where credit is due.

G. M. Codding

SPECIAL COMMITTEES

Appliqué Lighting*

APPLIQUÉ Lighting is the name given to one of the newest developments in the field of decorative lighting by which an illuminated design can be easily applied to any suitable large background. It is particularly applicable to the decoration of building exteriors, and offers an interesting variation to illuminated displays obtained by flood lighting objects or by outlining them with strings of lamps.

Figure I illustrates the way in which this decorative material could be applied to a building. The effect, of course, would be much more striking if it were shown in color.

The term "appliqué" has been commonly used in the past for the flat ornamentation of a textile material background with patches or designs. As applied to this new development in the field of Illuminating Engineering it refers to patterns and designs made up of illuminated units of different form as shown in Figure II which can be attached to the facade of a building or to the object that is to be decorated with light.

The forms of the individual units have been so chosen that a great variety of interesting and pleasing patterns can be constructed from a relatively few standard shapes. These shapes include a diamond, circle, arc (90 deg.), bar, rectangle and spearhead. The relative size of the units can be judged from Figure II. The Illuminating Engineer has not only a carefully selected set of unit shapes to work with, but also a variety of colors by which the combinations can be still further diversified.

The brightness of these units when lighted has been set at a value so that even an intricate pattern will remain clear-cut and distinct when viewed at some little distance. By day the units possess considerable ornamental value as the form and color of the design are not lost.

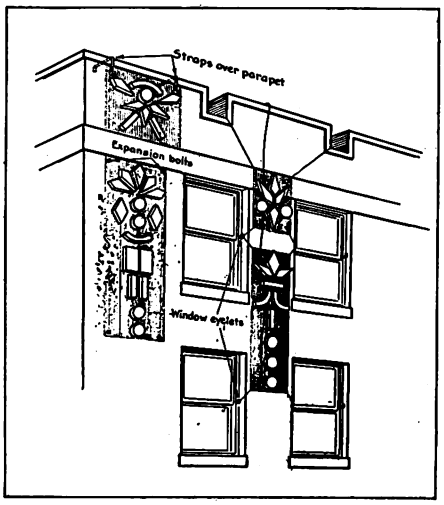

Fig. II

Appliqué lighting is particularly valuable in temporary installations where highly decorative effects are desired for some special event. It is flexible in its application; a given group of units is readily changeable into varied designs to suit the many different occasions that call for a lighted display. The wattage per unit runs from 20 to 50 according to size. Units have been made using exposed colored lamps running somewhat higher in total wattage. The additional load represented by such lighting can frequently be distributed over the present wiring of the building without exceeding its safe carrying capacity. The units can be installed easily and cheaply. The wiring of the units is made easy by the use of plug connectors by which they can be connected with each other and fed through cords carried through windows to outlets inside the building. The units are light in weight so that the problem of fastening them to the building is principally one of preventing their being dislodged by wind. Figure II shows methods of doing this.

Appliqué lighting adds another useful tool to the lighting specialist's kit and provides another attractive means for utilizing electricity in festival lighting and in general decorative displays of all kinds.

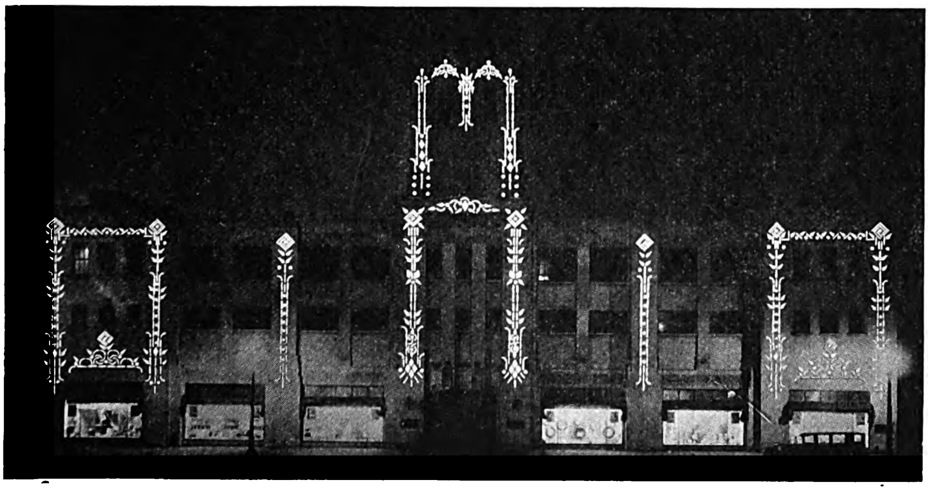

Fig. I

"Investigate Electric Heat"

"INVESTIGATE Electric Heat." This slogan won the first prize of $250 in the recent industrial electric heat contest conducted by the joint committee on Electric Furnace Development of the National Electric Manufacturers Association and the National Electric Light Association. It was submitted by W. H. Steinhauer of the Engineering Department of the Toledo Edison Company, Toledo, Ohio.

The returns in the contest numbered approximately 800 and evidenced wide interest in the subject of industrial electric heat. Submittals were judged by a committee of three judges—R. T. Kaighin, G. W. Tall, Jr., and F. M. Feiker, representing the National Electric Light Association, the National Electrical Manufacturers Association and the Society for Electrical Development, respectively.

Second prize of $100 was awarded to C. H. Pfingsthorn, 106 West Lincoln Avenue, Mt. Vernon, N. Y., whose slogan was "Switch to Perfection with Electric Heat."

"Electric Heat is Cheaper Than Rejects" won the third prize of $50, and was submitted by E. A. Heath, 211 East First Street, Fond Du Lac, Wisconsin.

Papers for World Power Conference

PAPERS for the Tokyo sectional meeting of the World Power Conference, which will be held in that Japanese city simultaneously with the World Engineering Congress to assemble there next October, had up to June 10 been received from foreign countries as follows: From Great Britain, 11; the United States, 14; Germany, 11; Czechoslovakia, 1; Switzerland, 7; Denmark, 4; Sweden, 14; Italy, 1, Russia, 5. From Japan itself 50 papers had been listed, covering six sections of the conference.

WHAT OCCURRED LAST MONTH

Colorado River Project

The Los Angeles and Salt Lake Railroad has applied to the Interstate Commerce Commission for the right to construct a railroad extension from its present line south of Las Vegas, Nevada, to serve the proposed Boulder Dam.

* * *

It has been announced in Salt Lake City that the sale price of power at Boulder Dam and the development of the Colorado River in Utah and other Upper Basin states will be the chief subjects of a six-states conference to be called by Governor Dern of Utah.

* * *

Dr. G. E. P. Smith, irrigation engineer at the University of Arizona, predicts that Boulder Dam will never be built. He thinks that the question will go to the Supreme Court of the United States and that there the project will be declared unconstitutional.

* * *

Representative Taylor of Colorado is seeking joint action by the four Upper Basin states to persuade the Federal Power Commission to continue a temporary embargo on all power permits along the Colorado River until a definite distribution program is agreed upon, which will protect all the states of the Basin.

* * *

Seeking to correct an impression that a large construction force is to be organized soon in connection with building the Boulder Dam project, Director General of the United States Employment Service Jones, in a statement on July 12, declares that construction of the project probably will not begin before 1930.

* * *

On July 16, the Colorado River Commission of Arizona decided that the Commission's legal staff shall make the necessary preparations to start litigation to protect the rights of Arizona in the Colorado River, and that the state should be ready to bring suit at once should the proposed tri-state agreement fall through.

* * *

Consolidations

Dispatches from Washington tell of a proposal offered by former Assistant Attorney-General Donovan for the creation of an Industrial Court as an agency of the Federal Government for determining in advance the legality of proposed mergers. The Donovan plan contemplates an agency similar to the Interstate Commerce Commission, which would have jurisdiction over all interstate trade and commerce, except public utilities. Business groups wishing to form combinations would lay their plans before the board which would give a decision in advance.

* * *

The Nebraska Electric Power Co. has been consolidated with the Western Public Service Co.

* * *

By acquiring the National Utilities Corporation, Ltd., controlling electrical plants at Port Alberni, the City of Alberni, and other points, the British Columbia Electric Railway Co. has gained control of all Vancouver Island utilities, with two exceptions.

* * *

On July 13, president J. N. Canavan of the Utilities Power & Light Corporation announced that St. Louis is to be linked with a power network extending to Louisville, Cincinnati and Chicago, through cooperative action of large utility units and construction of a new plant of the Indianapolis Power & Light Co. on the White River near Indianapolis.

* * *

A recent Scripps-Howard dispatch from Washington says that the formulation of a definite policy for dealing with recent mergers is one of the difficult tasks confronting Attorney-General Mitchell and John Lord O'Brian, Assistant Attorney-General in charge of the Anti-Trust Division.

* * *

On July 13, Senator King of Utah, in a radio address broadcast over a large network of stations, discussed the mergers which have been taking place and declared that there has been no sustained vigorous effort to enforce the anti-trust laws.

* * *

On July 16, the plan to organize the Niagara-Hudson Power Corporation was declared operative by the committee in charge as a result of the deposit of more than two-thirds of the outstanding common stocks of the Buffalo, Niagara and Eastern Power Corporation, the Northeastern Power Corpration and the Mohawk-Hudson Power Corporation.

* * *

President Sloan of The New York Edison Co. stated on July 17 that creation of a single electric company to serve Manhattan, Brooklyn, Queens, the Bronx and Westchester County, and linking of the steam generating system of The New York Edison and affiliated companies with the hydroelectric system of the Niagara-Hudson Power Corporation, are among the plans which are being studied by officials of the New York Edison system.

* * *

The Public Service Commission of New Hampshire has authorized consolidation of the Baker River Light & Power Co. and the West Campton Light & Power Co. with the Pemigewasset Electric Co. (formerly the Plymouth Electric Light Company).

* * *

Consumption of Electric Current

Figures recently issued by the National Industrial Conference Board are to the effect that in 1912 the electrical industry had less than 4,000,000 customers, while in 1928 it had 23,000,000. In 1912, the electrical energy used was distributed as follows: Lighting, 30.5 per cent; industrial power 36.1 per cent; and electric railways, 33.4 per cent. In 1928, the distribution was: Lighting, 24.5 per cent; industrial power 66 per cent; electric railways 9.5 per cent.

* * *

Earnings of Public Utilities

Gross earnings of public utility enterprises in May, exclusive of telephone and telegraph companies, as reported to the Department of Commerce by 95 companies and systems operating gas, electric light, heat, power, traction and water services, were $189,750,000, as compared with $190,000,000 in April and $180,255,407 in May, 1928.

* * *

Federal Trade Commission's Investigation

The National Education Association, meeting in Atlanta, Ga., adopted on July 2, a report of its Committee on Propaganda in Public Schools. This is a long and comprehensive study covering the whole field with only incidental reference to the utilities. In general, it holds that children should be taught how to think, not what to think, and should be prepared to evaluate material which may be classed as propaganda.

* * *

The Southern Newspaper Publisher's Association in annual convention on July 5 at Ashville, N. C., adopted a resolution drawn by Colonel Robert Ewing of the *New Orleans States* condemning the purchase of newspapers by interests affiliated with the power and newsprint industry as being "contrary to sound public policy and a menace to a free press and free institutions."

* * *

The annual meeting of the American Federation of Teachers in Chicago, July 5, adopted a resolution condemning "propaganda methods" employed by the "power trust."

* * *

July 15, the Federal Trade Commission sent to the Senate its Sixteenth Interim Report of the utilities inquiry. This says that since the last report examiners of the Commission have begun an examination of the accounts of six operating companies in three important holding company groups; that summaries are being prepared on the growth of capital assets and capital liabilities, the issuance of securities and the service fees of three holding companies, in preparation for public hearings; and that field work on the relations between utility companies and service organizations was completed at the offices of two of the more important management groups and work begun on two new groups and on one new sub-group.

* * *

On July 18, Judge Knox of the United States District Court for the Southern District of New York rendered his decision in the case brought by the Federal Trade Commission to compel the Electric Bond & Share Co. to produce certain books and papers, and to compel certain officers of the company to answer questions. The objections of the company to the subpoena requiring the production of books and papers are sustained. Those interposed to "pertinent and competent" questions propounded to individuals are overruled. The court does not determine which of the questions asked are "pertinent and competent." The court assumes that the company, as a part of its business, is engaged in interstate commerce, and says that, if the company wishes to contest this assumption, the matter will have to go to a Master for the taking of proofs; or, if the Federal Trade Commission wishes an adjudication to the effect that the intrastate business of the company is so intimately associated and connected with interstate commerce that all the company's activities are subject to its jurisdiction, a reference to a Master will be required to establish that fact. Either party may appeal from the decision within ninety days.

* * *

Foreign

Certain small cities in England have sent to the Government a joint manifesto expressing alarm over the purchase by American interests of British electric utility concerns.

* * *

On July 22, the $30,000,000 hydro-electric development on the Shannon River, Ireland, was officially inaugurated with appropriate ceremonies, and the waters of the river were in part diverted into the newly-built canal.

Information given out by the Department of Commerce is to the effect that the consumption of electricity in Great Britain increased about 10 per cent last year and has practically doubled during the past six years.

* * *

Hydro-Electric

The Public Utilities Commission of Tennessee, after conferences with the Federal Power Commission, has announced awarding certificates of necessity and convenience to the Holston River Power Co., subsidiary of the American Cyanamid Co., for three power projects on the Holston River in East Tennessee. Sanction for the projects must still be made by the Federal Power Commission. It is said that the proposed developments will cost about $35,000,000. The three projects will call for dams of 79, 135 and 130 feet in height.

* * *

The Canada Northern Power Corporation, Ltd., announces that a new power plant at Upper Notch, about 20 miles from Cobalt, on the Montreal River, will be erected at an early date. The proposed plant will cost about $1,000,000 and is expected to develop 13,000 horsepower. It is the intention to connect with the Canada Northern System for supplying power to the mines of Northern Ontario.

* * *

A dispatch from Toronto says that the Ontario Hydro-Electric Power Commission is negotiating for acquisition of several power sites in the vicinity of Ottawa. A member of the Commission declares that it is the Commission's policy to acquire, as far as possible, every power development in Ontario.

* * *

At Las Vegas, Nevada, on June 22, Secretary of the Interior Wilbur declared that the policy of the Administration with regard to great power and reclamation projects is to build the projects, protect the governments investment through contracts that will pay the money back into the treasury and then withdraw from the field. This course, he declared, would prevent the government's becoming involved in situations purely local.

* * *

A report of a survey made by the Geological Survey on the water power resources of the McKenzie River Basin, says that these amount to 442,000 hp. for 50 per cent of the time, and 289,000 hp. for 90 per cent of the time. The report estimates that if all the sites in the McKenzie Basin were developed and interconnected with a large power system, with steam standby to carry the load in dry seasons, the total usable power would equal twice the present requirements of the State of Oregon.

* * *

The Cumberland Falls Power Company has filed with the Federal Power Commission a brief presenting the wish of 200,000 residents of Kentucky that the company be given a fifty-year lease for development of the Falls.

* * *

July 20, the American Engineering Council announced membership of committees which will work with Congress and the Administration in shaping public policies involving engineering operations. There are committees on public affairs, on communications, on flood-control, on power and various other subjects.

* * *

On July 22, it was announced that the New York Water Power Commission had raised the rate on power-rights rented by the State to private companies from 75 cents per horsepower-year to $5 per horsepower-year. The rate was fixed on the application of the Niagara Falls Power Company. According to the *New York Times,* it is expected that the power company will challenge the legality of the Commission's decision, since it previously had a grant of similar facilities at the rate of 75 cents per horsepower-year.

* * *

An announcement made at Glens Falls, New York, on July 23 is to the effect that the Mohawk-Hudson Power Corporation has acquired water-power rights previously owned by the Union Bag & Paper Corporation on the Hudson River, near Hudson Falls. Construction will be started on a new hydro-electric station to develop about 75,000 horsepower.

* * *

July 24, Governor Roosevelt of New York, in an announcement made at Morrisburg, Ontario, said that he would present definite plans to the next Legislature for the development of the 1,000,000 potential horsepower at the International Rapids, near Barnhart Island.

* * *

Dispatches from Ottawa say that negotiations are under way with a view to arranging a conference of representatives of the Dominion Government and of the various provinces this fall on the subject of respective rights of the federal authorities and the provinces over water powers and navigation.

* * *

An Associated Press dispatch from Washington says that first reports on the most exhaustive inventory ever undertaken of the potential resources of 200 of the country's principal streams are being prepared by War Department engineers for submission to Congress in December. Congress authorized the study two years ago and has voted $12,322,000 to finance it.

* * *

A dispatch from Boise, Idaho, says that an application for 500 second-feet of water from the north fork of the Snake River has been filed with the Department of Reclamation. The application says that the water is to be used for power purposes and calls for construction of a dam 70 feet high. Under the new State law, the application will be advertised and a hearing opened to consider any protests.

* * *

Railway Classification

The Delaware, Lackawanna and Western Railroad has begun work on a construction program which will electrify 78 miles of roadway comprising 173 miles of track in north central New Jersey.

* * *

The Lehigh Valley Railroad has received bids for electrification of 75 miles of its main line between Mauch Chunk and Wilkes-Barre, Pennsylvania.

* * *

Rates

The Rawlings, Wyo., Electric Company, subsidiary of the Federal Light & Traction Company, New York, has put into effect a rate reduction of approximately 15 per cent, covering general lighting and street lighting.

* * *

The Northern New York Utilities, Inc., on July 1, put into effect reductions of about 25 per cent in forty towns and villages.

* * *

The Suburban Light & Power Company of Alliance, Ohio, has instituted a general reduction of 10 per cent in electric rates over its systems.

* * *

Reductions in rates of about 17 per cent have been put in effect by the Iowa Southern Utilities Company, which operates in 150 communities in the southern part of Iowa.

* * *

The California Railroad Commission is to hold hearings on August 27 and 29 concerning rates of the Pacific Gas & Electric Company and the Great Western Power Company. This is in continuation of hearings of June 4, when both companies presented evidence showing their present rates were reasonable.

* * *

The New York Edison Company and affiliated companies on July 16 announced another reduction in rates for Queens County. The initial rate will be cut from 8 cents a kilowatt-hour to 7 cents. It is estimated that this reduction means an annual saving to customers of $1,500,000. This follows a reduction of $4,500,000 announced by these companies last October.

* * *

The Pacific Power & Light Company announces a reduction of rates in Clatsop County, Ore., amounting to $30,000 a year.

* * *

The New Bedford, Mass., Gas & Edison Light Company has announced a rate reduction which will affect about 85 per cent of the consumers.

* * *

The North Dakota Railroad Board has approved revised rates proposed by the Northern States Power Company, the Red River Power Company and the Union Light Heat and Power Company, which affect a large part of North Dakota.

* * *

The amended electric rate schedule for Manhattan and the Bronx just approved by the New York Public Service Commission means a material reduction in rates for a group of large consumers. President Sloan of The New York Edison Company and associated companies is quoted as saying that the new classification will affect about 35 of the present large customers and is intended to stimulate larger wholesale use.

* * *

The Union Gas & Electric Company of Cincinnati has asked the Ohio Utilities Commission for permission to institute reduced rates for large primary power service.

* * *

Regulation

The Public Service Commission of New Hampshire has issued an order permitting export from the state of power developed at its Fifteen-Mile Falls plants on the Connecticut River by the Grafton Power Company, subsidiary of the New England Power Association. A clause in the order requires that all, or any part, of the power developed shall be available in New Hampshire when needed.

* * *

Governor Allen of Massachusetts has appointed three members of the special commission which is to study and report on activities of Massachusetts utilities. As the Senate and House members of the Committee were already appointed, the membership is now complete.

* * *

Governor Caulfield of Missouri has vetoed the so-called terminable permit bill passed at the recent session of the Missouri Legislature. The Governor contended that the measure invaded the charter rights of St. Louis. It was supported by many St. Louis officials and business organizations.

* * *

President Wyman of the Central Maine Power Company in a letter to stockholders concerning the referendum to be held September 9, when the question of export of current from the state is to be voted on, declares that if the export proposal becomes a law through a favorable vote it will mean a reduction of rates in Maine, the receipt of large sums of money by the State Treasury from taxes on export of current, more rapid development of the state's water power, and greater prosperity for the company.

* * *

According to the Portland, Me., *Telegram,* former Governor Brewster has announced his opposition to the power export bill.

* * *

On July 15, the committee appointed by Governor Roosevelt and the New York Legislature to inquire into the question of utility regulation in New York State held its first meeting and installed Colonel William J. Donovan, former Assistant Attorney-General, as counsel. Colonel Donovan presented an outline of a proposed program for the inquiry indicating a comprehensive survey of the whole situation. Members of the committee expressed their belief that the question of politics would be excluded. On July 17, Senator Knight, chairman of the committee, in an interview at Albany, said that the scope of the work would be to propose such amendments as would bring the Public Service Commission law up to date to meet existing business conditions and to make it conform to court decisions. On the same day, Frank P. Walsh, a member of the committee appointed by Governor Roosevelt, declared that the whole question of holding companies would undoubtedly be investigated by the committee and suggested that the committee might cooperate with the Federal Trade Commission and the Couzens Committee of the United States Senate in the fact-finding part of its work.

* * *

The Supreme Court of Nebraska has handed down a decision restraining the Interstate Power Company and subsidiaries from cutting rates at Hartington and at the same time the Court finds that electrical energy is a commodity and not a service. On this ground, its production, sales and distribution within the states are regulated by the anti-discrimination statute which prohibits a lower rate in one community, section or town, than in another where like conditions exist. The company

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Cost of Power in Manufactured Items

THE total amount spent for fuel and power by the industries of the country in 1927 was $1,897,337,523, according to the United States Census. This represents 7 per cent of the value "added by manufacture" (that is; the total selling value of all products manufactured, less the cost of raw materials used to make these goods,) and but 3 per cent of the grand total value of products.

Inasmuch as the item "fuel and power" represents not only power purchased from public utility enterprises and the fuel used by those plants that made power for themselves, but also coal used for blast furnaces, for the manufacture of gas and coke, oil used for heating, etc., it is evident that the actual *cost of power* is a very small item in the sum total of manufacturing expenses.

This is directly in line with a recent report of the Metropolitan Life Insurance Company based on a survey of Industrial Development in the United States and Canada. It was found that the so-called "Migration of Industry" accounts for only a very small percentage of the industrial development of American Communities and that the question of cheap power is subordinated to questions of market, labor, and transportation when industries are seeking locations.

Cathode Ray Used in Gem Testing

ACCORDING to an Associated Press Dispatch "the first commercial use for the famous cathode ray of the Coolidge tube has been found. Imitation sapphires are unmasked by the ray almost instantly and so thoroughly that they can be spotted in total darkness."

The stones, both imitation and real, are exposed for a few seconds to the powerful ray. All the imitations and all but one kind of genuine stone glow as if molten, but as soon as the ray is shut off the real sapphires lose the artificial glow while the imitations continue for some time to resemble live coals.

In addition to sorting stones, the ray can be used to determine where both natural and artificial gems come from.

"Should sapphires from Montana be mixed with stones that were supposed to come from Australia," said D. W. St. Clair, of the General Electric Company's standardizing laboratory, "we could find this out with the cathode rays. In the case of artificial stones we can determine which factory made them by the different tone of the glow while the rays are on.

Dr. W. D. Coolidge, of the General Electric Laboratories, who developed the tube, is seeking rays from still higher power—two or three million volts. His first tube, announced two years ago, uses 350,000 volts. Later, by a cascading arrangement of tubes, he obtained rays of 900,000 volts.

Horse-racing at Night

WE HEAR much these days about the changes which electricity has brought in the lives of the people. The standard of living has been raised to undreamed of heights; the worker is no longer a manual laborer, but a director of power; drudgery has been eliminated from the home; the farm is being turned into a miniature industrial plant; and what not.

At the same time we hear, every once in a while, of changes being made in the lives of domestic animals and even insects. Cows prefer the electrically operated milking machine to the old-fashioned hand power. Hens set about their business an hour earlier and stick closer to the job in coops lighted by the well-known incandescent bulb. Bees gladly start the honey-making season a month or two ahead of time if electricity is judiciously applied to their domiciles. It is even possible to raise "bigger and better" silver foxes on an electrified fox farm.

But it has remained for the Toledo Driving Club to put the racehorse to work at night. When the Board of Directors decided to illuminate the Fort Miami race track for night harness racing, other driving clubs and racehorse men throughout the United States were not convinced that the thing could be done. But it was done, and during the weeks of June 24th to June 29th, and July 8th to July 15th, lovers of harness racing from all over the country watched the fastest pacers and trotters in America contending for $150,000 in purses on an electrically lighted track by night as well as by day.

And the horses seemed to like it. For weeks prior to the opening of the meet they were given their daily work-outs at night. Drivers were dubious at first, and every precaution was taken to protect their expensive charges from fright or any attendant injury which might come from working under unaccustomed conditions. Shadow rolls, blinders, and in some cases even colored glass goggles were used on highly nervous horses. These precautions were apparently unnecessary, as the horses, from the first work-out, gave their drivers no trouble as far as lights and shadows were concerned.

Night horse-racing is successful, and undoubtedly has come to stay. Thousands of horse lovers, confined to offices, cannot attend daytime racing, but night-time racing can be patronized by all of the work-a-day world. Furthermore, the thoroughbred will work better in the early evening of a hot summer's day than he will under a blazing sun, and undoubtedly new world records will be established under the glare of electric lights.

A section of the Illuminated Race Track at Fort Miami

THE REVIEWING STAND

Development of Customers' Accounting Machines

Serial Report, Customers' Records Committee, Accounting National Section, N. E. L. A. Publication No. 289-74. 16pp. Price, 25 cents; 15 cents to members.

COMPANIES that are planning to install mechanical accounting appliances, or to extend their systems of mechanical accounting, will find in this report pertinent information on this subject.

Although the development and application within the past few years of mechanical devices used in public utility office accounting has opened a field of almost unlimited scope for study, this is perhaps the first detailed report describing the various kinds of equipment.

The report is based on answers to a questionnaire which was sent to all well-known manufacturers of mechanical devices of generally conceded importance, some 87 in number, from which 41 replies were received.—*E. S. B.*

Customer Ownership Committee

Serial report, Customer Ownership Committee, Public Relations National Section, N. E. L. A. Publication No. 289-78. 28pp. 3 illustrations; 2 tables. Price, 40 cents; to members 25 cents.

IN reviewing the work during the past year this report of the Customer Ownership Committee reveals that there has been a marked decrease in customer ownership financing in 1928 as compared with the five preceding years. Results for the year seem to reflect general conditions bearing upon the financing of capital requirements, and do not indicate any real loss of interest in customer ownership on the part of electric light and power companies. The reasons for this trend are clearly set forth in this report. A review of subscriptions to the National Better Business Bureau is given along with the customary statistical reports, and the Ten Cardinal Rules of Customer Ownership prepared by the Committee.—*E. S. B.*

Distillation Products of Coal

Serial Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-69. 24pp. Price 30 cents; to members 20 cents.

IN discussing low temperature carbonization this report of the Prime Movers Committee reviews the present status and the future of the industry and discusses the possibilities of low temperature tar, the interest in the manufacture of resins, and foreign developments.

Statements are contributed by Dr. Fr. Mueller, Kohlen Scheidungs Gesellschaft, Germany, who has been interested and active in the development of the KSG process in Germany, and thinks that the outlook for low temperature distillation of coal is very promising in Germany and in the whole of Europe, and that undoubtedly there will be a field of operation for the various processes developed.

A statement by Dr. C. H. Lander, Director of the Fuel Research Board, Department of Scientific and Industrial Research of the English Government, also is included, as well as a statement by The Babcock and Wilcox Company.

Low temperature carbonization as discussed at the World Power Conference, London, 1928, and at the International Conference on Bituminous Coal, Pittsburgh, 1928, is reviewed in this report and a bibliography for 1927 and 1928 is given.—*E. S. B.*

Hydro-Electric Bibliography and Manufacturers' Statements

Serial report, Hydraulic Power Committee, Engineering National Section, N. E. L. A. Publication No. 289-86, 24pp., 23 illustrations. Price 40 cents; to members, 25 cents.

IN addition to a comprehensive bibliography of hydroelectric subjects prepared by the United Engineering Societies Library, this report includes statements by half a dozen leading manufacturers of hydro-electric equipment. These contributed statements describe progress in design and construction of hydraulic turbines and auxiliary equipment. Many illustrations of equipment are shown and three test curves showing results of efficiency tests for turbines of 2,250, 36,000 and 40,000 h. p. are reproduced.—*E. S. B*

Developing Electric Service for the Farm

Serial report, Rural Electric Service Committee, N. E. L. A. Publication No. 289-65. 20pp., 14 illustrations. Price, 40 cents; to members, 25 cents.

THIS is the second of a series of reports by the Rural Electric Service Committee portraying in detail the rural electric service departments of member companies. This report of the series deals with the organization and method of Alabama Power Co. for developing electric service for the farm.

In presenting these reports the committee points out that it does not pretend to recommend the plan of organization and operation of any one company. It merely presents the methods of these companies for what they may be worth to those undertaking the organization and operation of Rural Electric Service Departments.

A summary of rural electric service development by Alabama Power Co. is presented by its President, Thomas W. Martin, as an introduction to the report. The extent of the company's interest in Rural Electric Service development is indicated by the fact that the Alabama Power Co., within the past few years, has invested more than $2,000,000 to enable it to furnish rural electric energy and is now serving more than 6,000 Alabama farmers.—*E. S. B.*

Stoker Equipment and Furnaces

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-71, 40pp., 54 illustrations, 3 tables. Price 55 cents; to members, 35 cents.

THE tendencies to increase stoker size and the input of coal per square foot of grate area have brought about improvements that are in line with operating companies efforts to reduce boiler plant costs. Such improvements discussed in this report deal with furnace construction and methods of introducing air at the proper place and, in the proper proportion for satisfactory combustion.

Operating companies' statements given indicate that air distribution has not yet been worked out satisfactorily. Continued improvement in stoker design to reduce maintenance costs and to increase efficiencies is to be noted in the submitted statements by leading manufacturers.

Experiences with water cooled walls have been satisfactory. Although comparisons are being made of the value of refractory lined and water-cooled surfaces, the committee states that sufficient data were not available to be included in the report.

Experiences with fans and preheaters are discussed in detail. The report is well illustrated and data are presented in readable form. A bibliography is included.—*E. S. B.*

Higher Steam Pressures and Temperatures

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-73, 40pp., 39 illustrations, 10 tables. Price 55 cents; to members, 35 cents.

THE practicability of operation and the thermal economy of the 1200-lb. cycle is shown by operating companies and manufacturers statements in this report. In addition to statements on stations that have operated at the above pressure for some time the report includes recent installations of high-pressure equipment. The report is well illustrated throughout.

A statement submitted by Professor

A. E. White on the Behavior of Metals at Elevated Temperatures gives a possible reason for the fact that although temperatures of 650 to 700 deg. fahr. have been common with 300 and 400-lb. units, 750 to 775 deg. fahr. appears to be the present practical limit for 1200-lb. installations.

The design of higher pressure and temperature equipment in the future is discussed in a contributed statement by C. F. Hirsfeld. Another interesting statement is that contributed by Professor F. G. Straub on the Relation of Embrittlement to Higher Steam Pressures and Temperatures.

A section of the report gives data on the relative construction costs of 400 and 1200-lb. equipment.—*E. S. B.*

Training for Better Public Contact —Building and Conducting the Training Program

Serial report Industrial Relations Committee, Public Relations National Section, N. E. L. A. Publication No. 289-83, 20pp. Price 15 cents; to members, 10 cents.

THIS report, the third of the series on Training for Better Public Contact being published by the Industrial Relations Committee, outlines and describes methods of Building and Conducting the Training Program.

Of the many possible methods of carrying on public contact training, the report presents three methods which clearly illustrate the principles and the problems to be encountered. The advantages and disadvantages of each method is discussed in detail and on the basis of the experience and observation of companies who have used one or more of the methods. Methods of measuring results that have been obtained by these various methods of public contact training will be discussed in the final report of this series, which will be published shortly.—*E. S. B.*

The Use of a Fixed Capital Records System for Insurance and Taxation Purposes

Serial report, Fixed Capital Committee, Accounting National Section, N. E. L. A. Publication No. 289-79, 12pp. Price 15 cents; to members, 10 cents.

UTILITY executives are given in this report a valuable outline of the use of a Fixed Capital Records system for Insurance and Taxation purposes.

Many public utility companies now have a Fixed Capital Records system of some description and it has been proved that the benefits derived from such records are no longer theoretical but are established fact. This report shows how the records of a Fixed Capital Records System may be used to provide the data necessary for insurance and taxation purposes, and how these data can also be coordinated with, and used to regulate and control, insurance and tax records.

In the conclusion the report lists seven items of insurance and taxation records which are provided by a Fixed Capital Records System at less cost than they could otherwise be obtained.—*E. S. B.*

Spillway Gates on or Adjacent to Dams

Serial report, Hydraulic Power Committee, Engineering National Section, N. E. L. A. Publication No. 289-84, 36pp., 24 illustrations, 5 tables. Price 40 cents; to members, 25 cents.

CONFINED to the design, construction and operation of spillway gates in actual use by operating companies, this report of the Hydraulic Power Committee is a most valuable contribution on this subject. Not the least among the useful features of the report is a bibliography of subjects relating to spillway gates.

Typical installations and types of equipment which might be of value to operators and designers of such gates have been selected as reflecting the best engineering practice in the United States and Canada. Valuable information from European sources also is included.

The report indicates that there is an increased tendency to install permanent and substantial crest gates on dams rather than renewable flashboards and also that clear-crest dams have become the exception rather than the rule.—*E. S. B.*

Proceedings International Congress on Illumination, 1928

1443 pages. Published under the direction of executive committee, International Congress on Illumination, 29 West 39th St., New York, N. Y.

THE seventh plenary session of the International Congress on Illumination held last year at Saranac, N. Y., is actively recalled by the proceedings which are now available.

The papers and discussions are truly international in character as practically all the more important nations in the world participated in this historic conference. The text appear in the language in which it was presented, French, German or English. A summary of each item in both French and English is provided to facilitate reference.

The following are among the various subjects discussed in detail: Street Lighting, Glare, Automobile Headlights, Distribution of Luminous Flux, Test Plates in Photometry, Natural Lighting, Vocabulary, Lighting of Factories and Schools, Aviation Lighting, Definitions and Symbols, Colored Glasses for Signals, Diffusing Materials, Residence Lighting, Accuracy of Photometry, Photometric Standards, Heterochromatic Photometry, Moving Picture Lighting and Show Window Lighting. Selected papers from the 22nd Annual Convention of the Illuminating Engineering Society are also included.

This volume is not only valuable as a reference, but also as an indication of the development of the art of illumination in the various countries throughout the world.—*A. B. M.*

Public Utility Salvage Methods

Serial report, Purchasing and Storeroom Committee, N. E. L. A. Publication No. 289-55, 16pp., 3 illustrations, 1 table. Price 25 cents; to members, 15 cents.

FOR companies who wish to realize the highest possible return from salvage materials this report describes various salvage methods that experience has shown to be practical and profitable. This comprehensive review covers a wide variety of materials including electric appliances, common brick, lead covered cable, cinders, fiber conduit, office furniture, incandescent lamps, lumber, metals, oils, paper, tools, etc.

The report includes an analysis of cost of reconditioned material which is presented in tabular form and illustrations of a salvage furnace for burning insulation from cable, wire, etc.

A second part of the report describes a recommended method of listing, advertising and selling salvage material. —*E. S. B.*

Rate of Deterioration of Impregnated Wood-Pulp Cable Paper Subjected to Heat Only

Serial Report, Underground Systems Committee, Engineering National Section, N. E. L. A. Publication No. 289-87, 20pp., 13 illustrations, 1 table. Price 25 cents; to members, 15 cents.

THE results of an extensive investigation of wood-pulp paper insulation as reported by the Mass. Institute of Technology (Report 3, March, 1928) are discussed in this report of the Underground Systems Committee.

An appendix presents a summary of the portions of the Institute's report dealing with test methods, equipment, preparation of specimens, etc., and a discussion of the results.

The conclusion which the committee presents indicate that these tests performed on wood-pulp paper, as used by representative American Cable manufacturers, gave erratic results which were expected from previous tests of this type.

Results shown by the curves obtained from individual samples and different samples are depicted graphically and discussed in detail.—*E. S. B.*

President, E. L. Edward, Michigan Electric Power Co., Lapeer, Mich.; *Secretary-Treasurer,* Herbert Silvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, G. W. Van Derzee, Milwaukee Electric Railway & Light Co., Milwaukee, Wis.; *Executive Secretary,* John N. Cadby, 502 Brumder Bldg., 105 Wells St., Milwaukee, Wis.

*Middle Atlantic Division

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary,* D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary,* A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, A. E. Bettis, Kansas City Power & Light Co., Kansas City, Mo.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Managing Director,* Joe Carmichael, 310 Crocker Bldg., Des Moines, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. Lee Jones, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, T. J. Strickler, Kansas City Gas Co., Kansas City, Mo.; *Secretary-Treasurer,* F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, C. H. Hodskinson, The Edison Electric Illuminating Co., Boston, Mass.; *Secretary,* Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, Thomas T. Parker, Northwestern Public Service Co., Huron, S. D.; *Secretary,* John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, M. L. Hibbard, Idaho Power Co., Boise, Idaho; *Secretary,* Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, E. B. Criddle, Southern Sierras Power Co., Riverside, Cal.; *Secretary,* Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, W. D. Johnston, Mountain States Power Co., Casper, Wyo.; *Secretary,* O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, H. S. Robertson, Denver Tramway Corp., Denver, Colo.; *Secretary,* O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, T. H. Tutwiler, Memphis Power & Light Co., Memphis, Tenn.; *Secretary,* C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, Fred W. Insull, Public Service Co. of Oklahoma, Tulsa, Okla.; *Secretary,* S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, Thomas R. Weymouth, Oklahoma Natural Gas Corp., Tulsa, Okla.; *Secretary,* Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Oyla.

Southwestern Public Service Association

President, Knox Lee, Southwestern Gas & Electric Co., Marshall, Tex.; *Secretary,* E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—(To be determined.)

Charles A. Coffin Prize Committee—M. S. Sloan, The New York Edison Co., New York, N. Y.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World,* New York, N. Y.

Public Policy Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Buffalo, N. Y.

Wiring Policy Committee—J. E. Davidson, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Stevens & Wood, Inc., New York, N. Y.

***Membership Committee**—A. Jackson Marshall, National Electric Light Association, New York, N. Y.

***Rural Electric Service Committee**—Eugene Holcomb, Consumers Power Co., Jackson, Mich.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—W. R. Emerson, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Budget Committee—B. F. Rodey, The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. Hasbrouck, C. H. Hopson & Co., New York, N. Y.

***Customers' Records Committee**—E. W. Korsmeyer, Henry L. Doherty & Co., New York, N. Y.

Exhibit Committee—T. A. Wallace, Henry L. Doherty & Co., New York, N. Y.

***Fixed Capital Committee**—Thomas M. Ford, The Philadelphia Electric Co, Philadelphia, Pa.

***General Records Committee**—C. E. McBride, Electric Bond & Share Co, New York, N. Y.

***Purchasing and Storeroom Committee**—K. C. Campbell, The Detroit Edison Co., Detroit, Mich.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio

General Power Committee—H. C. Thuerk, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—M. E. Skinner, New York Power & Light Corp., Albany, N. Y.

Commercial and Industrial Lighting Committee W. H. Horton, Jr., West Penn Power Co., Pittsburgh, Pa.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—Frank A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—(Not determined).

Refrigeration Committee—(Not determined).

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—A. D. Bailey, Commonwealth Edison Co., Chicago, Ill.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—R. A. Hentz, The Philadelphia Electric Co., Philadelphia, Pa.

Engineering Administration Committee—W. E. Mitchell, Georgia Power Co., Atlanta, Ga.

Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co., Detroit, Mich.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co, Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co, Atlanta, Ga.

***Meter Committee**—A. S. Albright, The Detroit Edison Co, Detroit, Mich.

***Overhead Systems Committee**—Sydney Alling, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World,* New York, N. Y.

***Prime Movers Committee**—R. D. DeWolf, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Underground Systems Committee**—G. C. McCabe, The Detroit Edison Co., Detroit, Mich.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—HARRY REID, National Electric Power Co., New York, N. Y.

***Cooperation with Educational Institutions**—JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—(To be determined.)

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—CHARLES B. STUART, Halsey Stuart & Co., New York, N. Y.

***Women's Committee**—MISS SARA HARRIS, Utica Gas & Electric Co., Utica, N. Y.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

August

2–6 *Camp Cooperation, Society for Electrical Development, Association Island, Henderson Harbor, N. Y.*

20 Executive Committee, Commercial National Section, Room 1741, Edison Building, Chicago, Ill.

22 Educational Committee, Room 950, Edison Building, Chicago, Ill.

27–30 ***National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.***

September

2–4 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs, Colo.

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 ***American Society for Steel Treating, Cleveland, Ohio.***

9–14—*Association of Edison Illuminating Companies, Quebec, Canada.*

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

23 Executive Committee, Accounting National Section, Palmer House, Chicago, Ill.

24 Executive Committee, Public Relations National Section, Room 1741, Edison Building, Chicago, Ill.

24–27 *Illuminating Engineering Society, Bellevue-Stratford Hotel, Philadelphia, Pa.*

25 National Executive Committee, Room 1741, Edison Building, Chicago, Ill.

26–28 Great Lakes Geographic Division, French Lick Springs, Ind.

28–30 ***American Electric Railway Association Convention and Exhibit, Municipal Auditorium, Atlantic City, N. J.***

30 ***National Safety Council, Stevens Hotel, Chicago, Ill.***

30 Hydraulic Power Committee, William Penn Hotel, Pittsburgh, Pa.

30 Overhead Systems Committee, William Penn Hotel, Pittsburgh, Pa.

30 Power System Engineering Committee, William Penn Hotel, Pittsburgh, Pa.

30 Prime Movers Committee, William Penn Hotel, Pittsburgh, Pa.

October

1 Executive Committee, Engineering National Section, William Penn Hotel, Pittsburgh, Pa.

1 Hydraulic Power Committee, William Penn Hotel, Pittsburgh, Pa.

1 Overhead Systems Committee, William Penn Hotel, Pittsburgh, Pa.

1 Power System Engineering Committee, William Penn Hotel, Pittsburgh, Pa.

1 Prime Movers Committee, William Penn Hotel, Pittsburgh, Pa.

1–2 Accident Prevention Committee, William Penn Hotel, Pittsburgh, Pa.

1–4 ***American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.***

1–4 ***National Safety Council, Stevens Hotel, Chicago, Ill.***

2–3 Electrical Apparatus Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Inductive Coordination Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Meter Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Underground Systems Committee, William Penn Hotel, Pittsburgh, Pa.

7–10 ***Third National Fuels Meeting, American Society of Mechanical Engineers, Bellevue-Stratford Hotel, Philadelphia, Pa.***

7–11 *National Electrical Manufacturers Association, Wardman Park Hotel, Washington, D. C.*

14–18 ***American Gas Association, Atlantic City, N. J.***

17–18 Kansas Section, Wichita, Kan.

22 ***The Electric Association, Chicago, Ill.***

22 Public Policy Committee, Edison Building, Chicago, Ill.

23–24 Public Utilities Association of West Virginia, Charleston W. Va.

November

21–22 Public Utilities Association of Virginia, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

December

2–4 Secretaries' Conference, Drake Hotel, Chicago, Ill.

NEW MEMBERS

Light and Power Companies, Employees of Light and Power Companies, Invited Persons, Manufacturing Companies, Employees of Manufacturing Companies, Associated Companies, Employees of Associated Companies and Foreign Organizations who have recently become Members of the National Electric Light Association.

NOTE: Names of new individual members are shown in the following order: First, in italics, post office address of company employing new members, and on the same line, in Roman letters, the name of the company employing new members; on succeeding indented lines, names of new members followed by post office address.

(July List—Continued from preceding issue)

- *Maine, Augusta,* Central Maine Power Company
  - Wallace A. Price
- *Maryland, Baltimore,* Consolidated Gas Electric Light & Power Co.
  - Arthur W. Albaugh
  - M. C. Albrittain
  - C. A. Brunner
  - Harry M. Burriss
  - C. L. Freeman
  - Chester S. Stackpole
  - Raymond P. Stansbury
  - William T. Taymans
- *Massachusetts, Boston,* The Twin State Gas & Electric Company
  - John C. Treanor
- *Michigan, Detroit,* The Detroit Edison Company
  - L. M. Grow
- *Michigan, Jackson,* Consumers Power Company
  - Robert J. Fowler (Flint, Mich.)
- *Minnesota, Duluth,* Minnesota Power & Light Company
  - A. E. McMillan
- *Minnesota, Minneapolis,* Northern States Power Company
  - H. W. Hopewell
- *New Jersey, Atlantic City,* Atlantic City Electric Company
  - Henry M. Cohen
  - Fred T. Ellenberg
  - George E. Haney
  - Miss Katherine A. Hannum
  - Miss Kathryn V. Hickey
  - Benj. F. Lee (Bridgeton, N. J.)
  - Walter A. Mathis
  - Wilbur S. Postoll
- *New York, Brooklyn,* Brooklyn Edison Company, Inc.
  - Elmer G. Hery
  - Alfred M. Temme
- *New York, Mt. Vernon,* Westchester Lighting Company
  - Andrew M. Anderson
  - Henry C. Borman
  - H. M. Brundage, Jr. (Scarsdale, N. Y.)
  - Charles F. DeLade (North Tarrytown, N. Y.)
  - Hans Prendle (Mt. Kisco, N. Y.)
  - Eugene H. Rosenquest, Jr. (Bronxville, N. Y.)
- *New York, New York,* Henry L. Doherty & Company
  - Chandler G. Burrows
- *New York, New York,* Electric Bond & Share Company
  - M. W. Brower
  - D. H. Couch
  - George Crawford
  - Juan B. Fuentes
  - Charles F. Haas
  - Mauro F. Herlitzka, Jr.
  - Fernando J. Lobo
  - Arthur Robottom
  - Francisco Valacha
- *New York, New York,* The New York Edison Company
  - Christian M. De Chauny
  - John S. Kerins
  - Hugh J. Ward
- *New York, New York,* United Electric Light & Power Company
  - Charles Livingston Ellis
  - Clyde J. Smith
- *New York, Long Island City,* New York & Queens Electric Light & Power Co.
  - Francis J. Baroncini (Flushing, L. I.)
  - George K. Volland (Jamaica, L. I.)
- *New York, Potsdam,* St. Lawrence County Utilities, Inc.
  - C. P. Scheller
- *New York, Poughkeepsie,* Central Hudson Gas & Electric Corp.
  - George H. Landis

- *New York, Rochester,* Rochester Gas & Electric Corp.
  - C. E. Jeerings
  - J. G. Little
  - J. S. Summers
- *North Carolina,* Raleigh, Carolina Power & Light Company
  - Wm. L. Yoder
- *Ohio, Cincinnati,* The Union Gas & Electric Co.
  - C. Kenneth Magers
- *Ohio, Cleveland,* The Ohio Public Service Company
  - V. O. Moore (Alliance, Ohio)
  - J. C. Welsh (Alliance, Ohio)
- *Ohio, Columbus,* The Columbus Railway, Power and Light Co.
  - Lyle Babbitt
  - Roy A. Brown
  - Morgan L. Evans
  - Chas. Gillivan
  - James K. Hall
  - M. M. Hanson
  - B. W. Marr
  - John N. Schwartz
  - C. C. Slater
  - William A. Wolls
- *Oregon, Portland,* Northwestern Electric Company
  - Fredric Seward Beach
  - Jesse D. Ellis
  - Ray C. Vivian
  - Day Ward
- *Pennsylvania, Allentown,* Pennsylvania Power & Light Company
  - Mrs. Millie Adams (Sunbury, Pa.)
  - R. J. Bachman (Catasauqua)
  - Miss Madeline B. Bercher (Pottsville)
  - M. E. Beyer, Jr. (Hazleton)
  - Mrs. Emily C. Billiard (Bethlehem)
  - Marie E. Bittenbender (Hazleton)
  - Colborn E. Blaisdell
  - Leo Chas. Bobb (Milton)
  - Ivy L. Bommer (Hazleton)
  - Miss Rachel K. Bowen (Sunbury)
  - G. L. Bowes (Lock Haven)
  - Helen A. Bratsch (Bethlehem)
  - W. S. Brokenshire, Jr.
  - H. M. Brown (Williamsport)
  - James Brown (Harrisburg)
  - Harry Chamberlain (Shamokin)
  - Harry L. Chamberlain, Jr. (Nesquehoning)
  - E. E. Chubbuck
  - Charles T. Cockey (Kingston)
  - William F. Coover (Jersey Shore)
  - Frances V. Courtney (Shenandoah)
  - Thomas Cowley (Bloomsburg)
  - Mrs. Helen Crane (Harrisburg)
  - Louis E. Curtis, Jr.
  - Miss Frieda G. Dammrich
  - Dorothy M. Daniel (Harrisburg)
  - J. R. Danner (Hazleton)
  - Mrs. Martha K. Deibler (Williamsport)
  - Richard Dougherty (Bethlehem)
  - Charles A. C. Eastman (Catasauqua)
  - Ralph W. Eilenberger (Stroudsburg)
  - Miss Elinore Engelman (Williamsport)
  - Miss P. Irene Evans (Slatington)
  - Miss Anna Faber (Wilkes-Barre)
  - D. C. Findlay
  - Miss Harriet Fisher (Mt. Carmel)
  - Miss Sue B. Flood
  - Richard Forbes (Pine Grove)
  - William A. Gallagher
  - Earl P. Garey (Sunbury)
  - Miss Mary A. Gavin (Catasauqua)
  - Edwin H. Gearhart (Williamsport)
  - Sheldon R. Gearhart (Forty Fort, Kingston)
  - James Gill (Hazleton)
  - M. F. Gill
  - Mrs. Jennie Graham
  - Lewis E. Gray (Williamsport)
  - F. A. Grimm
  - Mrs. Estella Haag (Harrisburg)
  - H. S. Hafleigh (Hazleton)
  - E. A. Hagenbuch (Mt. Carmel)
  - Murray C. Haines
  - Maurice H. Hall
  - Walter Hammernick (Mt. Carmel)
  - Howard J. Hann (Mt. Carmel)
  - Miss Viola M. Harlacher (Wilkes-Barre)
  - Miss Mary I. Harley
  - Miss Ethel M. Harwi
  - John M. Harwick
  - Miss Marie E. Hassler
  - Miss Helen M. Heffelfinger (Catasauqua)
  - Miss Minnie C. Heffelfinger (Catasauqua)
  - Edward R. Heil (Steelton)
  - Miss Gertrude M. Heller
  - Paul Holtz
  - Miss Eleanor M. Howe (Pottsville)
  - J. F. Hughes
  - Francis S. Hummel (Northumberland)
  - J. A. Hunter (Danville)
  - C. B. Huston
  - Harriet A. Irvin (Lehighton)
  - Frederick G. Keller
  - Miss Edna Klinger (Freeland)
  - Miss Mildred S. Kurtz (Muncy)
  - Paul W. Lambert
  - Carolyn M. S. Langford
  - Miss Sara E. Law (Lock Haven)
  - Miss Rose A. Lenahan (Wilkes-Barre)
  - C. E. Lewis (Pine Grove)
  - Miss Elsie V. Lichty (Fullerton)
  - Nettie Lithgow
  - John E. Ludeman
  - L. Z. Ludorf (Wilkes-Barre)
  - Walter R. McGee
  - F. R. McLean (Hazleton)
  - John B. Macfarlane (Harrisburg)
  - Edward G. Marsh (Stroudsburg)
  - Luther J. Mattern (Millersburg)
  - Franklin T. Merkle (Pine Grove)
  - J. A. Metz (Hazleton)
  - George Meyers
  - Lalla Michael (Millersburg)
  - E. W. Middleton (Hazleton)
  - George H. Milford (Hazleton)
  - Chas. C. Millar (Hawley)
  - F. V. Miller
  - Fred R. Miller (Honesdale)
  - Harold S. Miller (Lemoyne)
  - Miss Sadie B. Miller (Williamstown)
  - Alice L. Minor (Wilkes-Barre)
  - Miss Edna Mohr
  - Russell E. Moll (Sellersville)
  - L. Grace Moore (Milton)
  - John A. Mower (Minersville)
  - Miss Margaret Mullahey (Shenandoah)
  - H. H. Muschlitz
  - Miss Margaret Nell (Hawley)
  - H. B. Nelson
  - John W. Nicklas (Harrisburg)
  - I. W. Nye
  - Miss Grace O'Donnell
  - James Oliver (Hawley)
  - William H. Opp (Bethlehem)
  - Frank W. Packer
  - Miss Verna I. Peters
  - A. D. Pfeiffer (Williamsport)
  - Miss Genevieve A. Phillips (Williamsport)
  - J. Lane Polk, Jr.
  - C. L. Pollard (Pottsville)
  - James M. Ralston (Pottsville)
  - Roy U. Rapp (East Greenville)
  - Elvin E. Raub
  - Miss Eleanor J. Reed
  - John P. Reynolds, Jr.
  - Samuel L. Robbins (Hazleton)
  - Arthur J. Rockafeller (Danville)
  - Mabel Rupp (Steelton)
  - Miss Anna M. Schlegel
  - E. B. Schleppy (Hazleton)
  - Beula E. Schlicher
  - Albert Schuck (Shamokin)
  - L. Peter Schultz (Bethlehem)
  - Thomas E. Schuyler
  - C. B. Seib
  - H. L. Sell
  - H. T. Senseman (Harrisburg)
  - W. J. Senseman (Harrisburg)
  - Roy R. Shaak (Sellersville)
  - A. E. M. Shafer
  - Ben C. Shelley (Montgomery)
  - Marie Helen Shunk (Bethlehem)
  - H. T. Slaboski (Northampton)
  - Elmer W. Smith (Bethlehem)
  - Gordon F. Smith (Milton)
  - Miss Helen R. Smith (Williamsport)
  - W. R. Smith
  - Mrs. Louise M. Strome (Wilkes-Barre)
  - Miss S. M. Sweitzer
  - C. W. Taylor
  - Miss Virginia E. Tebbs (Stroudsburg)
  - Miss Geraldine M. Thomas (Jersey Shore)
  - Miss Jennie M. Thomas (Frackville)
  - James C. Thompson (Harrisburg)
  - A. J. Tobias (Tremont)
  - Stanley C. Townsend
  - E. E. Turner (South Williamsport)
  - Henry G. Wagner (Hazleton)
  - Miss Lillie Wagner (Lemoyne)
  - Arthur Vernon Ward
  - Miss Lelia E. Warner (Wilkes-Barre)
  - Ray Weirman (Bloomsburg)
  - Harold B. Weiss
  - E. P. Welch
  - W E. Welsh
  - Miss Marion I. Wetzel
  - G. E. Wheeler (Williamsport)
  - Rose R. Whittle (Harrisburg)
  - C. C. Wiker (Harrisburg)
  - John L. Wilhelm (Tamaqua)
  - Thomas Williams (Lansford)
  - J. H. B. Yeaton (Girardville)
  - James Yochum (Bethlehem)
  - Charles H. Yost
  - Pearl Zickler (Hazleton)
  - J. Harold Zimmerman
- *Pennsylvania, Carlisle,* The Carlisle Gas & Water Co.
  - Pauline Blaine
- *Pennsylvania, Lancaster,* Edison Electric Company
  - Joseph L. Scheinis
- *Pennsylvania, Norristown,* Philadelphia Suburban Counties Gas & Elec. Co.
  - William F. R. Munnick (Philadelphia, Pa.)
- *Pennsylvania, Philadelphia,* The Philadelphia Electric Company
  - B. Elliott Buchanan
  - John J. Cox
  - Miss Virginia Forkert
  - Dr. Wm. P. Hearne
  - Miss Bertha L. Martin
  - David H. Siegfried
  - Miss Florence R. Slocum
  - Vernon H. Spencer
  - Miss Nan R. Webb
  - Clifford Winner
- *Pennsylvania, Philadelphia,* The United Gas Improvement Company
  - L. A. Sommar
- *Pennsylvania, Pittsburgh,* Duquesne Light Company
  - R. E. Polk
  - Frank B. Saunders
  - A. W. Stevenson
- *Pennsylvania, Pittsburgh,* West Penn Power Company
  - L. F. Blassingham
  - Lawrence E. Jeffreys (Canonsburg)
- *Vermont, Chester,* Chester Power & Light Co., Inc.
  - R. W. Babcock
- *West Virginia, Charleston,* Appalachian Electric Power Company
  - M. A. Steckel
- *Canada, Quebec, Montreal,* Montreal Light, Heat & Power Consolidated
  - H. W. Haberl, Esq.

Manufacturers (Class D)

- *Illinois, Chicago,* American Concrete Marbelite Company
- *Illinois, Rock Island,* Rock Island Mfg. Co.
- *Massachusetts, Boston,* Tower Mfg. Co.
- *Michigan, Detroit,* Electrovent Corporation
- *Michigan. Detroit,* Whitehead Refrigeration Company
- *New York, Buffalo,* Remington Rand Business Service, Inc.
- *New York, New York,* Luckenbach & Hallberg, Inc.
- *New York, Rochester,* Vacuumizer Manufacturing Corporation
- *Ohio, Cleveland,* Hi-Voltage Equipment Company
- *Ohio, Cleveland,* The Proctor & Schwartz Electric Co.
- *Ohio, Dayton,* The Master Electric Company

Employees of Manufacturing Companies (Class E)

- *California, San Francisco,* Pacific Electric Manufacturing Corporation
  - C. F. Lomont (Gary, Ind.)
- *Connecticut, New Haven,* Whirldry Corporation
  - J. E. Murphy
  - Geo. Reama
- *Connecticut, Waterbury,* Beardsley-Wolcott Mfg. Co.
  - Mrs. Bessie L. Potts (Boston, Mass.)
- *Illinois, Chicago,* Benjamin Electric Mfg. Co.
  - Arthur M. Stevens (Des Plaines, Ill.)
- *Illinois, Chicago,* Edison Electric Appliance Co.
  - C. J. Anderson (Portland, Oregon)
- *Illinois, Chicago,* Federal Electric Company
  - D. H. McKindley
- *Illinois, Chicago,* Schweitzer & Conrad, Inc.
  - J. P. Lane (St. Louis, Mo.)
- *Illinois, Macomb,* Illinois Electric Porcelain Company
  - C. W. Kettron
  - J. W. Ward
- *Illinois, Rock Island,* Rock Island Mfg. Co.
  - H. W. Stickle
- *Massachusetts, Medford Hillside,* Doble Engineering Company
  - Charles A. Bachelder
- *Michigan, Detroit,* Electrovent Corporation
  - D. M. Rollins
- *Michigan, Detroit,* Knott & Garlius Company
  - A. M. Berger (New York, N. Y.)
  - F. L. Blanchard
  - A. L. Horn
  - G. E. Stedman
- *Michigan, Detroit,* Whitehead Refrigeration Company
  - H. V. Collins
  - T. C. Whitehead (River Rouge, Mich.)
- *Michigan, Grand Rapids,* Leonard Div. of Kelvinator Corp.
  - A. D. McCaughna
- *Missouri, Centralia,* Chance Company
  - A. Bishop Chance
  - N. C. Husted
- *Missouri, St. Louis,* Electrol Incorporated
  - J. L. Coppe
  - L. E. Saxby (Upper Montclair, N. J.)
- *Missouri, St. Louis,* Wagner Electric Corporation
  - H. N. Felton (New York, N. Y.)
  - P. Loyd Lewis (Kansas City, Mo.)
  - R. W. Piper (Richmond, Va.)

Canada, Quebec, Montreal, Southern Canada Power Co.
W. R. Wonham

Invited Members (Class C)

Idaho, Moscow, University of Idaho, Mr. Hobart Beresford
Wisconsin, Madison, University of Wisconsin, Royce E. Johnson
Wisconsin, Madison, Mr. Alvin Meyeres

Manufacturers (Class D)

New York, Binghamton, Nineteen Hundred Corporation
Canada, Ontario, Hamilton, The Coffield Washer Company of Canada, Ltd.

Employees of Manufacturing Companies (Class E)

California, San Francisco, Pacific Electric Manufacturing Co.
H. F. Darby, Jr., Philadelphia, Pa.
Dudley H. Morier, New York, N. Y.
Connecticut, Branford, Malleable Iron Fittings Co.
V. I. Hammer
Connecticut, Bridgeport, Bryant Electric Co.
W. M. Phillips, Philadelphia, Pa.
Connecticut, Bridgeport, Harvey Hubbell, Inc.
Theron L. Merritt, New York, N. Y.
Walter M. Wyman, Philadelphia, Pa.
Connecticut, Hartford, Colt's Patent Fire Arms Co.
Howard A. Snyder
Connecticut, Hartford, Hart Manufacturing Co.
J. W. C. Price, New York, N. Y.
J. U. Willman, Chicago, Ill.
Connecticut, Hartford, The States Company
Roger H. Blakeslee, West Hartford, Conn.
Connecticut, Meriden, Manning Bowman & Company
P. H. Rutty, Upper Montclair, N. J.
Connecticut, Meriden, The Miller Company
H. L. Harrison
Crawford Maddox, Philadelphia, Pa.
L. T. Wilcox
Connecticut, New Britain, Landers, Frary & Clark
Pault T. Bullock, Philadelphia, Pa.
C. J. Cooper, Jr.
R. E. Gooley, Hackensack, N. J.
Fred W. Juengst
Rafael Jugo
H. W. Karstens
Frank P. Nester
H. A. Quackenbush, New York, N. Y.
Samuel H. Warn
Connecticut, Plainville, Trumbull Electric Manufacturing Co.
E. C. Forest, Philadelphia, Pa.
E. F. Storm, Philadelphia, Pa.
Connecticut, Torrington, The Fitzgerald Manufacturing Company
Howell H. Grandin
Walter H. Lown
G. C. Yake, Toronto, Ontario, Canada
Connecticut, Waterbury, The American Brass Company
H. B. MacNish
Connecticut, Waterbury, The Beardsley & Wolcott Mfg. Co.
Louis V. Lucia, Hartford, Conn.
Connecticut, Waterbury, Bristol Company
George H. Gaites, Philadelphia, Pa.
Henry L. Griggs, Waterbury, Conn.
William Rose Keller, New York, N. Y.
John S. Mayberry, New Haven, Conn.
C. S. Wadhams
Illinois, Chicago, American Concrete Marbelite Company
Leo M. Arms
P. C. West
Illinois, Chicago, Beardslee, Chandelier Mfg. Co.
Charles L. Benjamin
Illinois, Chicago, Benjamin Electric Mfg. Co.
J. S. Dunlop, Baltimore, Md.
Elliott Ranney, Westfield, N. J.

Complete Service

(*Continued from page* 474)

to preserve this confidence. It is a very delicate thing and can easily be lost. The American people are fair in their judgment when they have the facts—real facts—upon which to base their judgment. Business is now giving the facts to the public in every way it can. The most successful businesses are those which are the most informative.

Business always needs public confidence, and this confidence can only be obtained if business men themselves inform the public about all phases of their businesses. What we need more than anything else are campaigns of honest, informative publicity by businesses, so that the man in the street will understand that what is being done is for the greatest good of the greatest number. If that is not what any business is doing then it should be out of business, and it can test itself most readily by frank and open publicity. That is the significance and the value of the work your Section is carrying on.

Behind the Veil

(*Continued from page* 485)

other day, at Sir John Pringle's table, where I had the pleasure of dining with Franklin, Priestly and other great geniuses."

Perhaps one of the most amusing publications is that of John Wesley, the founder of Methodism. In 1759 he issued his "Desideratum; or Electricity Made Plain and Useful, by a Lover of Mankind and Common Sense." In this, he relates at great length, the cures of numerous physical and moral ailments, attributed to the employment of the electric fluid, under such curious headings as "Electricity the Soul of the Universe," "Electricity, the Greatest of All Remedies," etc.

There are many other names appearing in the scientific history of the last half of the 18th century, but space forbids even the most limited description of their work. So we will pass on, next month, to the beginnings of the 19th century with Sir Humphry Davy and the history of the electric arc light.

A Public Relations Yardstick

(*Continued from page* 479)

Employees trained improperly — the strings flat—customers dissatisfied—the brass sharp—narrow visioned management—the conductor incompetent—and our orchestra becomes an object of ridicule and contempt. That is why we must have a definite plan to harmonize the efforts of our five factors. *Every* factor must be in tune.

How will others see us after we have brought this about? They will see that we are an institution of character—a worthwhile, desirable citizen of every community we serve. They will see that we are honestly trying to live up to the simplest and finest code of business ethics yet given to men—

"Do unto others as you would have them do unto you."

A complete list of all N. E. L. A. publications will be sent upon application to the Sales and Order Department, National Electric Light Association, 420 Lexington Avenue, New York, N. Y.

What Occurred Last Month

(*Continued from page* 530)

concerned operates in more than forty towns.

* * *

The Washington, D. C., *Times* says that the Corporation Counsel of the District of Columbia is about to make a sweeping investigation of the ownership of capital stock in all public utilities of the District.

* * *

The Supreme Court of Nebraska has held unconstitutional a law passed in 1927 permitting the creation of hydro-electric districts of one or more units, either urban or rural, on the ground that the Legislature unlawfully delegated legislative powers to the courts, by leaving to their discretion the questions of public policy, convenience and welfare as related to the organization, incorporation, boundaries, powers and government of the proposed districts. This is the fourth law intended to permit farmers to organize districts which has failed to meet constitutional requirements.

* * *

Sources of Power

The City of Charlotte, N. C., has in operation a gas engine which makes use of sewage sludge gas derived from the city's sewage-collection system. During one month the gas supply produced about 25,000 kw-hr. of power. Similar engines have been in use in England.

* * *

An article in the New York *Times*, July 7, says that the Philadelphia and Reading Coal and Iron Company is to enter into large-scale production of electric power by the use of coal-dust accumulated at its collieries.

* * *

Textile Plant Bought by Utility Company

Controlling interest in the Bates Manufacturing Company of Lewiston, Me., a cotton textile manufacturing plant, has been acquired by the New England Public Service Company, a subsidiary of the Middle West Utilities system. A New York *Times* dispatch from Chicago quotes a spokesman for the Insull interests as saying that it is their intention to invest in New England textile enterprises to "forestall financial ruin and consequent distress to numerous communities through enforced idleness of thousands of workers."

THE PRESIDENT'S PAGE

The Best Tribute

IT IS fitting that this number of the N.E.L.A. BULLETIN be given over to honor Mr. Edison. Light's Golden Jubilee will be an international celebration to his great gift to humanity — the incandescent lamp — in which all electric interests will participate with other business and civic interests. The electric industry, however, owes to itself a special recognition of his genius and a special tribute to this man, out of whose labor and vision has come the great public servant which our industry is.

More than any other man, living or dead, Edison contributed to make electricity USEFUL to humanity. He brought it into the realm of practical workaday life where its energy could light our ways and bear our burdens. Combining the gifts of the scientist and the business man, he was able to invent, manufacture and distribute, all to the end that electricity might be put to work and life might be made easier and better.

In the fifty years since Edison produced his lamp, the electric industry has become a major factor in the economic scheme of our land. Yet he himself says it is only "a squalling baby" compared with what it will grow to be. It will be our job and the job of our successors to make it ever more useful to mankind—to relieve humanity of every task which electricity can be brought to do. That will be our industry's best tribute to Edison who showed us the way.

MSSloan

President.

N·E·L·A· BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Copyright 1929 by National Electric Light Association.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service."

M. S. SLOAN, *President*

Subscription price of the N. E. L. A. BULLETIN, in United States, is $3.00 per year to members and non-members. Half price to colleges and libraries. Single copies, 25 cents. Foreign subscriptions, $4.00 per year to non-members.

Orders should be made direct to the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

The closing date for the N. E. L. A. BULLETIN is the fifteenth of the month preceding the month of issue. Material intended for publication must be in the hands of the editor by that date to insure publication the following month.

Manuscripts and correspondence relating to the N. E. L. A. BULLETIN should be addressed to the Editor, N. E. L. A. BULLETIN, 420 Lexington Ave., New York, N. Y.

The National Electric Light Association does not assume responsibility for nor necessarily endorse, or approve, statements made by individual contributors.

Code address of the National Electric Light Association is "Nelap," Bentley's code.

For the convenience of members arriving in New York after office hours or on legal holidays, the following telephone numbers connect with N.E.L.A. headquarters office:

Lexington	3312	Editorial Department

MR. EDISON, this is your magazine.

We hope that you will feel pleased with it and accept it as another symbol of the esteem and affection held for you by those who are laboring in the industry that is so beholden to you.

There will be many who will feel hurt because they were not invited to contribute to it. It was a most difficult thing to decide who would be asked. Somewhat through desperation, an arbitrary method was used.

Three representative groups of men were selected, and from these lists, in hit or miss fashion, the names were taken.

We hope that the pride of those chosen will not suffer from this revelation. They will recognize that there are many, many others who had equal claims to be heard.

May you and that Admirable Band—the Edison Pioneers—enjoy with yet another generation the Diamond Jubilee of the Incandescent Lamp.

Of this issue, 27,000 copies have been printed; 22,893 for members of the Association and subscribers to the N.E.L.A. BULLETIN, *the balance for friends of Mr. Edison throughout the world*

THE PIONEER

By WILLIAM S. BARSTOW

President, The Edison Pioneers

IT is indeed a privilege to live in a period which has witnessed the birth and practical development of a great industry. It is even more of a privilege which the Edison Pioneer has enjoyed to have been associated with such a birth and development. Although many of the Pioneers have passed away, those who remain well remember the long days and nights of uninterrupted labor which finally produced results which Mr. Edison himself states were far beyond his thoughts at the start.

The high resistance filament, resulting in what was termed "subdivided light," was the beginning of a revolution in lighting, the effect of which we can even now see no end. Many an obstacle, seemingly insurmountable, Mr. Edison overcame through his perseverance, courage and optimism. Nor were his efforts confined to a single field, but wherever new discoveries could result in benefits to mankind, there he was found laboring at all hours of day and night.

During his many experiments to find a solution of a problem, Mr. Edison would frequently come across certain unusual phenomena, which, while not bearing directly on the problem in question, were of such importance that he carefully noted them at the time for further investigation. Thus, while developing the lamp, he noted what was termed the "Edison Effect," and which was the foundation of the radio tube of today. In these very early days he took out a patent (1879), for wireless communication, and the illustrations showed it in use on land and sea. Many notes are now preserved and will no doubt act as a guide for future investigations.

The value of Mr. Edison's contributions to the welfare, comfort and amusement of his fellowmen can never be measured, as on them, no doubt, will be founded many new developments in years to come.

The Pioneers, in their many years of close association with "the old man," have learned not only to admire his outstanding genius and ability to solve the most difficult problems, but to treasure as well his lifelong friendship. With the familiar twinkle in his eye, he many times enlivened the long hours with a joke or a good story. He often confessed that the most interesting parts of his many magazines were the last pages of jokes. Today, at the age of eighty-two, when many are resting from life's labors, he does not hesitate to take up the solution of practical problems in new fields, and in this he has been remarkably successful. He is a true example of his own saying, "All things come to him who hustles while he waits."

By JOHN W. LIEB

Chairman, The Edison Pioneers Sponsoring Committee for Light's Golden Jubilee

AS I sit at my desk under a speaking likeness of Mr. Edison, my memory goes back to the strenuous yet happy days many years ago when the old pioneers worked and labored under the immediate personal inspiration of the great master's tireless energy and boundless enthusiasm.

Day and night, in season and out of season, we followed the new roads of progress disclosed to us by the genius whom we worshipped, and no obstacle was too great, no exercise of the imagination was too lofty, in the endeavor to follow the leadership and guidance of him, whose thoughts and aspirations seemed so far beyond human ken and our feeble comprehension.

A few hasty enigmatic words of instruction, the merest pencil scratches to serve as a sketch, an insatiate desire to learn the results long before an actual test of the new idea could be made, an unquenchable desire to search out new facts and invade new fields of knowledge, these were the guide posts that urged us on in our every fibre to meet the promptings and follow the instructions of this greatest of pioneers.

These, then, are the memories that crowd around us as we contemplate that friendly, kindly and benign, yet strong and determined face of the man, whose achievements and the practical applications of whose ideas in our lives have worked such a marvelous change in the forward march of civilization, and which the world will recognize on Oct. 21, with a celebration in honor of one of his outstanding accomplishments, by celebrating Light's Golden Jubilee.

May the world continue for many years to come to benefit by the inspiration of his life and work. May he continue to enjoy health, vigor and happiness, and may those of us who have had the distinguished privilege to contribute in even the most humble and insignificant measure to the realization of the dreams of this great genius, live over again in joy and happiness the memories of the pioneering days of half a century ago.

Milestones of Progress in a Great Industry

A Brief Perspective

By FRANK J. SPRAGUE

THE half-century anniversary of Edison's invention of a practical incandescent light is a fitting time to briefly review the modern milestones of progress in a great industry, which has contributed so much to a changing civilization, and in particular his contributions to it and his influence thereon.

This period has been marked by four major epochs—the creation of the lamp itself, with its system of supply and distribution, the development of the industrial motor, the inauguration of electric traction and the invention of the alternating current system. Of these Mr. Edison has been chiefly identified with the first, his labors in the other fields having been negligible or experimental, and in that of the alternating current nil. Hence, I venture the prediction that in the final analysis his greatest fame will rest upon his accomplishments in what I may term the "domestication" of the electric light.

CONSIDER for a moment the conditions existing fifty years ago. There had been many experiments with both arc and incandescent lights, and the former, particularly as developed by Brush, was in successful commercial use. As early as '59 Prof. Moses G. Farmer had lit a room with incandescent lamps comprising a metal filament inclosed in a glass globe from which air had been exhausted, and pencils of carbon similarly enclosed had been tried. Self-exciting dynamos for both alternating and continuous current had been developed by Pacinotti, Gramme, Siemens, Farmer, Weston and a host of others, and the reversible function demonstrated, the series, multiple and combined methods of coupling up translating devices in electrical circuits were well known, and every water, gas and steam system was an example of individual parallel unit supply.

And why could not an electric light system duplicate these public utilities. That's what Edison, after pondering over the limitations of the arc light, asked himself. So, contrary to current opinion, and in the face of violent criticism and ridicule, he set himself the task of creating an incandescent lamp whose resistance, current consumption, life and cost would make its unit use commercially possible, which result, regardless of the original and contemporaneous work of other inventors, among whom Swan and Weston should particularly be mentioned, he first achieved after untiring and ingenious experiments and research. So in October, 1879, the period of gestation ended, and Edison by a Caesarian operation brought into being the incandescent carbon lamp.

THEN came the expansion of the individual parallel circuit into a net work, supplied at different points by feeders extending from a battery of high-resistance shunt field dynamos, either belted to or driven directly by high-speed engines, and a host of detail developments essential to general use, in which he had the active cooperation of such men as Kruesi, Stieringer and Bergmann.

But even with a station located, as at first, in the center of a district, the practical limit of potential reached in lamp manufacture remained an economic handicap. So to get the advantage of a higher electrical pressure, and thus materially increase, with reduced cost of copper, the area of distribution, there was proposed by Edison here, and independently by Dr. John Hopkinson in England, the 3-wire system, really a multiple-series grouping of lamps, supplied by dynamos in series, with a grounded balance wire between the juncture of dynamos and the lamp groups, this grounding, however, limiting the expansion of the system to a higher combination.

This was first put in use with overhead conductors in Sunbury, and later on the underground system in Brockton. Then came the rapid expansion of Edison central stations, the earlier companies being designated "Lighting" or "Illuminating," for until the spring of 1885, when the Sprague motor was officially adopted by the Edison Company, lighting was the principal objective. This period would seem to have marked the peak—but what a high one!—of the distinctive Edison system and his individual contributions thereto.

Then came the advent in the United States of the polyphase alternating current system, under the aegis of Mr. Westinghouse, following earlier European developments, with its marvelous capacity of inverse variations of potential and current and consequent possibilities of long distance high-tension transmission, and the attendant commercial rivalries of the Edison and Westinghouse interests in a so-called "battle of systems," and monopolistic effort. In 1886, I had, in a private report, without avail urged upon the former the combination of these two developments. This system, too, had to go through its initial trials, but thanks to many devoted workers, among them Stanley, Thomson, Tesla, Bradley, Challenberger, Lamme, Steinmetz and others in this country and abroad, various serious difficulties were finally surmounted.

Then came the era of electric traction, whose commercial birth took place at Richmond, this followed by the multiple, unit train-control development, these declared by Dr. Huber-Stockar the modern milestones, and now by an increasing activity in main-line equipment, of vital import to general power supply systems—but this is another story.

THE correlation of the direct and alternating current systems has made possible the great modern power distributing plants, by which the area which may be supplied from a common source, either directly or through substations, has been increased a hundred-thousand fold; and instead of a multiplicity of independent limited central stations, any number may now be coupled together to form a country-wide network of supply for every purpose for which electricity may be used in the universal service of man.

Today the tungsten metal filament, as developed by Coolidge, and the new gas lamps have doomed the carbon lamp, great polyphase alternators of from 150,000 to 200,000 hp., driven by high-speed steam or water turbines, are displacing the older type, and the direct current itself faces a formidable rival in industrial applications, but back of it all, and more responsible than any other in early stimulating effort, is Edison's original brilliant work and conception.

On it has been built up, by thousands of workers and in a myraid of ways, aided by university training, business acumen, unlimited capital and exhaustive research, the solid structure of which the N. E. L. A. is one of the greatest representatives.

THOMAS ALVA EDISON

A SYMPOSIUM

By M. H. AYLESWORTH

National Broadcasting Company

WHEN the ceremonies celebrating Light's Golden Jubilee are held Oct. 21, they will be heard around the world by means of a medium which owes much to Thomas Alva Edison, central figure in the world's electrical development.

So diversified are the talents of this man, so great are the contributions that he has made in the realms of science and invention, that his early work in production of the microphone are frequently obscured. Radio, quite recent among mechanical marvels, centers on the microphone, and progress in broadcasting has been made in the measure of perfection of the microphone.

Radio will carry to listeners, not only in the United States, but into every continent on the globe, the messages of good will which America will give to Thomas Edison. Truly, this is the drama of life.

By R. H. BALLARD

Southern California Edison Company

THAT note of optimism which always has characterized the electrical industry of America is due, in no small measure, to the career of Mr. Edison. Here is an industry which was founded on vision, nourished on courage and which now, as ever, looks forward with full confidence toward the future, knowing that Mr. Edison and those others whose lives are dedicated to the work he established will have the ability to meet every obstacle that is encountered. No Golden Jubilee has ever been so permeated with the spirit of youth as that now being celebrated to commemorate the first incandescent lamp. It is no coincidence that the world's most notable progress has occurred during the half century which began on October 21, 1879.

By N. F. BRADY

New York Edison Company

UNDER the light of an electric lamp (invented by Edison) we may write a message to be sent to the ends of the earth for a reasonable sum—thanks to Edison; listen over the telephone to the voice of a far-away friend—thanks to Edison; read the news or stock quotations on the ticker—thanks to Edison; hear on a phonograph the voice of Caruso or Melba—thanks to Edison; or go about our daily tasks, made easy by the sub-division of electric current, from toasting the morning's bread and preparing the coffee to riding in elevators, street cars or subway to our work, again made light by electric fan or heater, according to the season—thanks to Edison. To him—long life and happiness here below, and hereafter the reward of a life well spent.

By HENRY G. BRADLEE

Stone & Webster, Inc.

EDISON'S patient, persistent, and unremitting research has largely contributed in establishing the mileposts of civilization's marvelous progress of the last half century. To me he is unique and is aptly described by the words of Emerson which follow, "The power which resides in him is new in nature, and none but he knows what that is which he can do, nor does he know until he has tried."

By B. C. COBB

Allied Power & Light Corporation

TO say that Thomas A. Edison is a genius seems superfluous. To say that we admire, respect and love him for the wonderful things he has done for humanity, I think is more fitting and a comment that Mr. Edison himself would prize more highly.

By J. E. DAVIDSON

Nebraska Power Company

FROM the time of my boyhood days in Port Huron, Michigan, I have idolized Thomas Edison—for it was there that he spent many years of his life. And it was in Port Huron where I took up an apprenticeship in the electric industry, one of my first jobs being the reading of the meter of his sister's home. Now, as his photograph hangs on the wall of my office, autographed by his own very hand, I am stirred to think that it is the very same mind and hand that has produced so much in human advancement and benefaction; the same skillful hand that brought forth the incandescent lamp which has meant so much to everyone everywhere. Thomas A. Edison's works mean to me a greater inspiration in activities of our industry, to be of greater service to mankind.

By FRANK L. DAME

The North American Company

IT is a privilege to join in the tribute to Thomas A. Edison, personally because of my long connection with the industry that owes so much to him, and also in behalf of the stockholders of The North American Company, which had the honor of association with Mr. Edison during the first year of the company's existence nearly forty years ago.

During the period from June 1 to Oct. 21, 1929, while the world is celebrating Light's Golden Jubilee, The North American Company—on June 14, 1929—entered its fortieth year. These circumstances are especially significant to me because The North American Company prizes among its records an original counterpart of the contract of Oct. 1, 1890, to which Mr. Edison, The North American Company and the Edison General Electric Company were parties, providing for "the application of electricity as a motive power to railways of all descriptions and to important improvements in connection with the use and application of electric power."

It was with a feeling of pride, and recognition of what Mr. Edison means to the light and power industry, that we recently reproduced the signatory page of that contract, together with a published review of the Annual Reports to the Stockholders of The North American Company since its organization in 1890, and presented these historical records in pamphlet form to the many thousand stockholders of our company.

By HENRY L. DOHERTY

Henry L. Doherty & Company

MANY men have physical courage; some men have moral courage, and sometimes as the centuries roll by we find a man who has both intellect and intellectual courage. Thomas A. Edison is to me the greatest example of this latter type. He not only had intellect, but he had the intellectual courage to live his own life according to the pattern he found in his own brain.

By CHARLES L. EDGAR

Edison Electric Illuminating Company of Boston

THE electrical industry is the true monument to Edison. The genius of this modest man has enabled our industry to bear his standard before the entire world and to shed light and comfort upon the pathway of human progress.

Those of us who have been associated with him from the beginning find it difficult to express in ordinary language our feeling of profound veneration for him. Those who have not been so associated have, I believe, missed a great experience. All of us in our great industry have enshrined deep in our hearts the satisfaction of being able to live and work under the inspiration of Thomas Alva Edison.

By CHARLES E. ESTABROOK

Edison Pioneers

I CANNOT allow "Light's Golden Jubilee" to pass without paying a tribute to Mr. Edison. He means to me almost my whole business life. He has always been to me an inspiration to do better things. As an Edison Pioneer, we consider him "The Pioneer" to whom we owe the comforts of life.

By JOHN F. GILCHRIST

Commonwealth Edison Company

THE little building in which the Chicago Edison Company began its central station business was so arranged that the employees of the dynamo, switch board and meter rooms could reach their work only by passing through the principal executive offices or through the boiler room and alley. Before and after office hours the first entrance could be used, if your feet were clean. During office hours there was no choice.

One evening, after office hours, in 1889 the writer, on opening the door from the Board room to the dynamo room, found the Board room occupied by a group of distinguished-looking men, who, he afterwards learned, were Directors of the Edison Company, standing around a flat top desk, at which was seated a large man with a smooth, boyish-looking face. Mr. Edison, who he proved to be, had, through the influence of Samuel Insull, then vice-president of the Edison General Electric Company, come out to look over the Chicago situation. The table was entirely covered by a piece of manila drawing paper. With a pencil Mr. Edison was rapidly sketching the distribution system of the future as he saw it, a generating station on railroad tracks, with ample condensing water, transmission lines, substations and local distribution lines—what has proved to have been a perfect picture of today's methods, although at that time such a plan was an absolutely new thought, and I do not think there was an electrical substation in existence anywhere.

The directors of the Edison Company were so absorbed in Mr. Edison's picture that no one paid any attention to the young meter boy, and he had an excellent opportunity to observe the plan, but more particularly to observe the man.

The same clear, simple foresight that was the outstanding feature of the scene mentioned above has characterized Mr. Edison's work and is typical of the simplicity, the genuineness, the keen insight and the rugged, common sense of the man, who with his untiring work and perseverance, has been the greatest inspiration of the men in the electrical industry.

By FRANKLIN T. GRIFFITH

Portland Electric Power Company

EDISON, the scientific pioneer, has, for fifty years, been an inspiration to the steadily growing army of men and women devoting their lives to the further development and utilization of the product of his genius. In the history of mankind, while still living, he occupies a position of preeminence that can only be heightened and glorified by the appreciation of countless generations yet unborn.

THOMAS ALVA EDISON

A SYMPOSIUM

By C. E. GROESBECK

Electric Bond and Share Company

THE electric industry has been built upon Edison's discoveries. No other industry owes its inspiration and progress so completely and overwhelmingly to the outstanding genius of one man.

Edison blazed the trail not only through his inventions, but also through their application to everyday life. The world is as much in debt to Edison for working out the complicated details of the first commercial electric light system as for his discovery of the incandescent lamp.

Basically, the methods of supplying light and power to the public are the same today in the modern electric system as those which he developed in the old Pearl Street plant.

Furthermore, the work of electrifying the United States has to a large extent fallen upon the shoulders of men who were trained by Edison in the pioneer days, and today many of these men are still active in the development of the industry.

It is no exaggeration to say that, considering the contribution which electricity has made to mass production in the factory as well as to the comforts and conveniences of the home, Thomas Edison, directly and indirectly, has done more to raise standards of living throughout the world than any other man since history began.

By FRANCIS JEHL

Edison Pioneers

THOSE who were gathered around him in the old Menlo Park laboratory enjoyed his confidence, and he theirs. Nor was this confidence ever abused. He was respected with a respect which only great men can obtain, and he never showed by any word or act that he was their employer in a sense that would hurt the feelings, as is often the case in the ordinary course of business life. He conversed, argued, and disputed with us all, as if he were a colleague on the same footing. It was his winning ways and manners that attached us all so loyally to his side, and made us ever ready with a boundless devotion to execute any request or desire.

To this I wish to add, in the words of my good departed friend, T. C. Martin, "Thus does a great magnet, run through a heap of sand and filings, exert its lines of force and attract irresistibly to itself the iron and steel particles that are its affinity, and having sifted them out, leaving the useless dust behind, hold them to itself with responsive tenacity."

By T. A. KENNEY

Allied Power & Light Corporation

WE are indebted to Mr. Edison for his great foresight and courage in the development of the electrical industry and for his guidance and inspiration to every one connected with it.

By THOMAS N. MCCARTER

Public Service Electric and Gas Company

WE of the electric light and power industry owe to Thomas A. Edison the very basis of our industry. By the magic of his mentality he converted scientific speculation into practical accomplishment and showed the way to tremendous advancement in the economic and social life of the nation.

By JOHN B. MILLER

Southern California Edison Company

MR. EDISON'S middle name should have been "Alpha" instead of "Alva," for it is to his genius that we owe the beginning of our industry. I do not think there will ever be an "Omega."

Born and brought up in Port Huron, the son of an old school and playmate of Mr. Edison's, his name has always been a household word in our family and, to me, an example of what genius, coupled with imagination and perserverance, can accomplish.

By JOHN J. O'BRIEN

H. M. Byllesby & Company

THE inspiration of Thomas A. Edison's personality has been so much a part of the daily life of workers in the electrical industry that it is exceedingly difficult to express its full power and meaning. It is almost as though Edison and electricity were one and the same. Since boyhood the name "Edison" has possessed for me the significance of unmeasurable vitality, closely affecting the lives of myself and associates.

I believe that I can relate an incident which shows the bigness of Edison and his kindly and helpful nature better than anything I have ever read or heard.

In January, 1912, the tenth anniversary of the Byllesby organization was celebrated by a splendid banquet at the Congress Hotel in Chicago. As a tribute to Colonel Byllesby personally and his business success, many leaders of finance and industry accepted his invitation to attend. It was a gathering of distinguished men and our own young organization, and the chief guest of honor was Thomas A. Edison. Alongside Mr. Edison sat such men as Charles A. Coffin, Samuel Insull, Charles G. Dawes, George M. Reynolds and Victor Lawson, to mention only a few.

To understand Mr. Edison's presence it is necessary to recall that this was the first and last time he visited Chicago or the Middle West since the Chicago World's Fair in 1893. Seventeen years ago he was then far from a young man. A trip to Chicago in the dead of winter—and it was decidedly sub-zero temperature—meant to him a serious sacrifice in time and comfort, and some peril to health.

THOMAS ALVA EDISON

A SYMPOSIUM

And yet he came to honor one who, as a young man, had worked for and with him in the early days of the industry, and his presence went far to make the affair one of the most notable of the kind ever held in Chicago.

No one at this gathering was more simple, unassuming and friendly than Mr. Edison. After the dinner he sat for an hour or more autographing menu cards and exchanging pleasantries with old and new acquaintances. I recall that Mr. Samuel Insull thought he should get Mr. Edison safely tucked away at the Blackstone Hotel, and Mr. Edison, looking up from making his signature and saying, "Don't hurry me, Sammy. I'm all right and I want to please these boys."

When he offered a toast to Mr. Edison, Colonel Byllesby said:

"Thirty years and about eight months ago, as a mere stripling, or mere striplings, Mr. Insull and myself entered the electrical industry in subordinate capacities under Thomas A. Edison. I will not take up your time; it would be idle, it would be foolish to repeat the achievements which have written Mr. Edison's name high on the scroll of the immortals. I can only say that every one of us engaged in this business primarily have bottomed our success upon the wonderful achievements of this wonderful man. I do not attempt to pay tribute this evening to the genius of Mr. Edison. In the words of Huxley, 'that was merely a happy accident of birth,' but what I do pay tribute to is the never-faltering faith, the energy, the industry which developed that God-given gift into the marvelous results which we see today. To Mr. Edison, in common with every worker in this field, I owe a debt of gratitude."

Mr. Insull responded for Mr. Edison in a splendid speech, in the course of which he said:

"I asked Mr. Edison to write down some message to the young men here, and I will read it to you. It is in his own handwriting. He said: 'When you get a job, pitch in, pay no attention to time. Get more interested in the business than the old man himself. Think of nothing and talk of nothing but shop. Then when you want to leave to better yourself, the old man won't let you. He'll raise your salary or take you in as a partner.' "

I have always thought that it was particularly fine of Mr. Edison to attend our celebration. His presence encouraged and stimulated us greatly. He made a living force completely human to our organization. Edison to me, and the whole Byllesby organization, means far more than I have the power to put into words. I am glad indeed that I have this opportunity to acknowledge the wonderful, personal manner in which he inspired us more than seventeen years ago. The world is his debtor, and none more than we.

* * *

By J. F. OWENS

Oklahoma Gas & Electric Company

TO me Edison is the spirit of America incarnate. He typifies that individual enterprise and daring which has resulted in the conquering of a wilderness, the taming of streams, and the reclamation of desert wastes. He dared venture into the unknown—to think new thoughts and to seek out the solution of the riddle of Nature's laws.

He is a product of the philosophy so well expressed in the Constitution of the United States as conceived by its makers, that a nation can be no more than the sum total of the hopes, aspirations and ambitions of the individuals who are its citizens.

No other theory could have resulted in the absorption of men and women of every race and background and their welding into a unified people. America and American philosophy of goverment has made Edison and his work possible, and he in return has given back to the world a thousand fold because he has lived. Men and women of every race and clime have today greater comforts, greater opportunities and larger lives.

It is a fearsome thought to contemplate the possible effect of movements, indorsed and championed by well meaning but misguided individuals who would, to further a cause, perhaps in itself worthy, supplant the individualistic theory of government that has made Edison and his work possible, with a paternalistic government that would direct instead of respond.

Are we as individuals to become learners rather than leaders? Are we to look to Washington for our thoughts rather than further those whom we delegate to carry out our wishes, with facts and ideas as the basis upon which their course may be shaped? Are we to delegate our rights and our God giving talents to bureaus and commissions? Shall we forget that progress of the human race must be through the development of the individual, and slow though it may be and impatient as we may become at its slowness, may we not realize that no other method can make for lasting betterment?

It is well, as we celebrate the fiftieth anniversary of Edison's greatest achievement, to ponder on whither we are drifting, or have we gone too far in shifting our responsibilities; have bureaus become so entrenched, so enmeshed in politics that we cannot take back to ourselves the rights that are ours under the Constitution?

Are we too indifferent to the tendencies of the time to take warning from the history of other republics just as full of promise in their early days as ours, or are we too lazy to care? What of our children and our children's children? What shall we pass on to them, I wonder?

By R. F. PACK

Northern States Power Company

IT has been said that we Americans are dollar worshippers. The life of Thomas A. Edison and the place he holds in the hearts of the American people, and indeed throughout the civilized world, is a substantial refutation of this charge. There are few of us, his fellow countrymen, who know whether he is rich or poor. We never have been interested in that phase of Mr. Edison's life. That which commands our interest, our admiration, and indeed our love, is the man himself and the contribution he has made toward the building of a better civilization. His fertile mind, his inexhaustible industry, have made this an immeasurably better and more comfortable world in which to live. He will leave us a heritage of infinitely more value than anything the greatest of fortunes could provide. He is more than a leader, more than the outstanding figure of a great industry—he is a world figure. His contributions to the advancement of science command the respect and gratitude of the entire civilized world. In addition, he is a hero and an inspiration to every American boy. He constitutes an enduring idol—one of the few of human clay whose lives and achievements have kept him always foremost in the esteem of his fellow men.

By HARRY REID

National Electric Power Company

THE past fifty years has brought greater progress in daily life than the entire previous history of civilization. Who but Edison has been the leader in this great social change? Few men have changed, or will change, the world, as Edison. By pondering his accomplishments, we can the better appreciate that great thing called "Progress." Such pondering leaves us amazed. Amazed that any one man could do even a part of what Edison has done.

By A. W. ROBERTSON

Westinghouse Electric & Manufacturing Company

FIFTY years ago Thomas A. Edison produced a practical incandescent lamp. Today the direct and indirect outgrowth of that invention, the electric light and power industry, represents an investment of ten billions of dollars.

To me the most significant fact in this great development is not the creative genius of Edison, whose wizardry of invention stands unparalleled, but rather the man himself. His integrity, patience, industry and practicality are symbolic of this great industry.

Many men of the sound progressive vision of Edison have identified themselves with the electrical industry and have created for it a sound public confidence, until today the securties of the electric light and power companies are owned by the citizens of every state in our country.

This assurance, in the minds of the great general public, of the soundness of the industry has been largely responsible for its remarkable growth, and for this confidence the industry owes a great debt to Mr. Edison and to those other outstanding figures associated with him in the founding and growth of the industry.

By MARSHALL E. SAMPSELL

Central Illinois Public Service Company

TO Thomas A. Edison more than to any one man, or group of men, is due our marvelous transition from primitive days into an era of ever-increasing growth and expansion of industry, business, transportation and communication. He has made it possible for us to translate the dreams of our electrical industry into time and labor-saving realities.

By PAUL E. SCHOELLKOPF

Niagara Falls Power Company

IN this age of mass production, one marvels all the more at the human accomplishments of Mr. Edison. Among so many benefits to mankind, through his personal efforts, he virtually made possible the electric service of today. Pioneers closeiy associated with him in those earliest days, carrying with them his inspiration, are today among the greatest leaders of the central station industry. To me he is the personification of human accomplishment and the desire to serve.

By FRANK W. SMITH

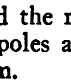
United Electric Light and Power Company

TO one who has been continuously identified with the electric lighting business from its beginning—back in the days of series arc lighting and through the development of the alternating current system from its early stages of operation from overhead mains, the outstanding accomplishment of Mr. Edison has always seemed to me to be his conception of a complete electric lighting system from generating station to the customer's premises by means of underground distributing mains. In the writer's opinion, no other accomplishment emphasizes so thoroughly and completely the genius and foresight of the great inventor as this fact.

The incandescent lamp, important as was its perfection by Edison, was but one element of this complete system. With no guiding precedents, he conceived and built a system that involved the complete design and construction of many of its component parts. Edison had uncanny vision to conceive a system at the outset—in his pioneer days—that would remove for all time the trouble and worries and operating difficulties inherent in an overhead system in great metropolitan areas. Edison was free from the long drawn out litigation that preceded the removal in the large metropolitan areas of overhead poles and wires and the introduction of underground system.

Light's Golden Jubilee is a nation-wide tribute to the monarch of an industry, the existence of which has been made possible by the wonderful visualization during those early pioneer days fifty years ago, shortly after the termination of the Civil War, of this great American, Thomas Alva Edison.

May we, of the industry, be privileged to have him with us on the centenary of his existence and to pay him the further homage that will be due him for the achievements which will be his over another score of useful years.



By ELMER A. SPERRY

Sperry Development Company

THOSE of us who had the privilege of years of work under the leadership of Thomas A. Edison as Chairman of the Naval Consulting Board were afforded a unique opportunity for contact that we shall never forget, and for which we can never be too thankful. At times the breadth of his grasp of a situation was nothing short of startling and gave us a glimpse into the brilliance of his insight and his versatility in the solution of difficult problems and situations.

By PROFESSOR ELIHU THOMSON

General Electric Company

IT gives me great pleasure to testify to the inestimably great influence Edison's development of the incandescent type of electric lamp had in the pioneer days of the application of electricity in illumination. Though preceded by many instances of lighting by electric arc lamps here and abroad, he had the courage to follow to commercial success his early efforts in establishing incandescense in its true relation to the infant industry; namely, distribution by small lighting units replacing a gas light. Not only that, he built up a great system of generation, distribution by multiple arc, and provided the essentials of switch sockets, fuses and potential regulation, surviving today even though the lamp itself has gone over from carbon to tungsten wire.

But above all, Edison has been the typical great inventor, whose energy and versatility have not been confined to one field. As examples, it is only necessary to mention the variable resistance transmitter for telephonic use, the phonograph, moving pictures, and many inventions of world-wide application.

By FRANK A. WARDLAW

Edison Pioneers

NEARLY half a century has passed since it was my proud privilege to have been associated with Mr. Edison, with countless opportunities during the intervening years to have become familiar with all he has done for the advancement of science, his benefactions to industry, and the alleviation of human drudgery. During those years it was also a privilege to have become familiar with the personal side of his nature; all these cherished contacts but accentuating a prior conviction that to him is due a greater measure of indebtedness for the human progress of today than to any other living man, and one for which the world should ever be grateful.

By EDWIN R. WEEKS

Weeks & Kendall

KANSAS CITY, MO., regards as its greatest treasures one of the first dynamos made by Edison, with which, in the early 80's, I operated the first Edison lamps in the city, and one of Mr. Edison's first phonographs and the original cylinder bearing his voice to an audience of thousands during the National Electric Light Association Convention here in February, 1890. They are among the hundreds of wonderful inventions which have filled the life of one of the world's greatest men and by far its greatest inventor, Thomas A. Edison.

By WALTER F. WELLS

Brooklyn Edison Company

EDISON caused me to give up my youthful desire to become a locomotive engineer and inspired me to prepare for a life in the electrical industry.

The business he initiated provided an opportunity in which to develop my talents and assist in the development of the talents of thousands of my co-workers in an industry which is rendering a highly appreciated public service to the residences, stores and factories of our city, and which affords the worker a fair compensation for his endeavors and earns for the security-holders a fair return on the capital invested.

By OWEN D. YOUNG

General Electric Company

EDISON is the personification of the industry. A vision of a great service to be performed; a faith that it could be done. Unremitting toil, unexampled ingenuity; persistence and patience, finally crowned with accomplishment. Work, work, work! May the industry always carry on.

By JOHN E. ZIMMERMANN

United Gas Improvement Company

GREATER than his contribution to the science of electricity are the benefits which Mr. Edison has conferred upon the social life of the nation. The electric industry, inspired by his genius, has largely removed the burden from men's backs to the machine, and has set in motion a movement of population from the larger cities to the smaller centers and rural communities, where men and women can own their own homes, and enjoy better social conditions and live a freer life. His greatest social contribution has been in relieving the womanhood of the country of the drudgery of domestic life.

From Many Viewpoints

HOW significant the living presence of Thomas A. Edison is in the United States and how vast and intimate are his works in the life of the country is brought out with impressive lucidity by expressions of appreciation voiced by members of the General Committee for Light's Golden Jubilee.

From these various representatives of the nation's economic, educational, religious, sociological, military and political life, have come keen estimations of the meaning of the great genius to the country.

They range from analysis of specific benefits of the electric incandescent lamp to broad appraisals of not only all the inventive achievements of Mr. Edison, but also the intangible, though nevertheless, recognized influence of his exemplary and inspiring career.

MISS JANE ADDAMS

Jane Addams, as an authority and writer on social reform, sees the electric light as a powerful force in that phase of life in which her energies are engaged. She views it as a moral force, rounding out city life more completely by making possible modern recreational facilities.

This is her estimation of the meaning of the inventor's achievement:

"Mr. Edison's perfection of the incandescent lamp affords perhaps the world's most striking example of the manner in which moral progress from time to time has been so suddenly promoted by the inventor as to leave the professional moralist gasping in amazement. Certainly the new urban recreation so dependent upon parks, community centers and municipal beaches, with its high educational value, would have been quite impossible without the safeguard and the charm of the lights whose golden jubilee we are now celebrating."

GEN. ROBERT LEE BULLARD

With military terseness and accuracy, General Robert Lee Bullard gives this eulogy on Mr. Edison and his electric lamp:

"A new and mighty impulse—perhaps the mightest ever—to the advance of civilization.

"Light's Golden Jubilee, as I see it, is more than a tribute to a great inventor. To me it has a deeper significance than that of celebrating the fiftieth anniversary of Edison's incandescent lamp. It is making an otherwise preoccupied world open its eyes to the progress it has made during the past half-century, and to realize what changes have been wrought within the comparatively brief span of fifty years."

WALTER P. CHRYSLER

Walter P. Chrysler, of the Chrysler Corporation, in an analysis balancing the benefits of Mr. Edison's inventions against the example of the man's life finds the scales of his judgment weighed in favor of Mr. Edison's stimulating influence.

"Light's Golden Jubilee," he said, "as originally conceived, centered around the electric lamp Edison invented fifty years ago, but the movement has spontaneously taken on a much broader character. Though the lamp may be Edison's greatest invention, and though it has been of incalculable benefit to hundreds of millions, nevertheless, the man himself is greater than any material thing he ever put together, and the example of his life has a higher value for society than any of his accomplishments.

"Service to humanity, is the ideal of our modern civilization, and it is because Thomas Alva Edison perfectly personifies this ideal, that people in all walks of life and everywhere in the world are enthusiastically anxious to participate in the jubilee."

PAUL D. CRAVATH

Tersely, Paul D. Cravath gives his description:

"The signal achievement of Thomas A. Edison in inventing the incandescent lamp, whose fiftieth anniversary we are celebrating this year in Light's Golden Jubilee, is one of the greatest factors in the world as we know it today, both as regards the home and business life of every individual."

JOHN W. DAVIS

John W. Davis, in an impressive eulogy, adds to the tribute with this statement:

"What a debt of gratitude we owe to the Sage of Menlo Park! He literally brought the world out of darkness into light. It is utterly impossible to compute the benefits from this invention. Certainly its influence on modern life has been broader than that of any other.

"Goethe, no matter how his dying request for 'more light' may be interpreted, could not have contemplated such a fulfillment."

GEORGE EASTMAN

George Eastman, inventor of the Kodak, and chairman of the Board of Directors of the Eastman Kodak Company, doubts the ability of any individual to estimate the entire meaning of the incandescent lamp.

Not only as an achievement in itself, does he recognize the light as an outstanding invention, but because of its stimulus to other inventors and increased production of methods and machines in manufacturing.

"I do not believe that any one man can estimate the full significance of the fiftieth anniversary of Mr. Edison's incandescent lamp," is his assertion. "In my business the electric light has been used since 1882 when the Edison Company installed one of its first plants in our laboratory in Rochester.

"This system of lighting was used when film photography was invented and perfected two years later. During the past half century the electric light has contributed to the creation of more new products and manufacturing processes than any other single utility.

"But the significance of this anniversary does not rest entirely on what has been done. No one can predict what scientists will accomplish during the next half century, but the contrasts between today and the future will be as great or even greater than they are between 1879 and 1929.

"One fact, however, will always be recognized. Mr. Edison is the pioneer in the world system of electrical illumination."

GOVERNOR FRED W. GREEN

Speaking his personal opinion, as well as in behalf of the State of Michigan, where Light's Golden Jubilee will culminate Oct. 21, at Dearborn, Governor Fred W. Green contributes an impressive statement to the list of encomiums.

"The citizens of Michigan are most happy to join with our nation in paying homage to the world benefactor, Thomas A. Edison, by commemorating the fiftieth anniversary of his perfection of the incandescent lamp," he stated.

"Michigan is the scene of his early activities as a newsboy and is where he later gave first thought and attention to the handling of electricity. It was here that the foundation was laid and the inspiration gained for his later accomplishments.

"Our State is especially active in this nation-wide movement and has an unusual part in this tribute through the activities of Henry Ford in completely restoring at Dearborn the Menlo Park Laboratories where Mr. Edison perfected the electric light. Here will be established not only a record of the life and inventions of Mr. Edison, but also a collection of his original tools and reports.

"In Mr. Edison we have a national and industrial hero, a man who in addition to his many achievements is possessed of the highest type of character of which we are all proud. It is a pleasure and a privilege to pay tribute to him for what he is, and for what he has accomplished."

WILLIAM GREEN

The widespread benefits that electric light has brought to the world is pointed out interestingly and with marked effect, coming as it does from William Green, president of the American Federation of Labor.

"The Old Record tells us that in the beginning the creation of light preceded the coming of man. Light is such a primary factor in human life that we are accustomed to use the term in speaking of spiritual things as well as physical. Customs and civilization itself adapt themselves to control of light," he said.

"To Thomas A. Edison who gave us greater control of artificial light, we owe many of the comforts and opportunities of modern life. Mr. Edison's lamp has brought new control over time that not only serves work, but has also broadened the possibility for leisure and recreation for all who work.

"On behalf of those who work as wage earners, I am glad to pay tribute to the betterment Mr. Edison's genius has brought into our daily lives."

THE DOCTORS MAYO

The significance of Mr. Edison to the country as the inspiration of many other scientific advances through his pioneer work in electricity is stressed by Dr. Charles Horace Mayo and Dr. William James Mayo. They both made this statement:

"America may well pride itself on the marvelous advances in industry and commerce which in one generation have led to the prosperity of all the people, and on those advances in medicine which have prolonged the average lifetime of man more than eighteen years. It has been well said that very great human advancement has been the prolonged shadow of one man. The great achievement of Mr. Thomas Alva Edison in perfecting the incandescent lamp has lifted mankind from darkness into light, and has initiated a wonderful series of events which have been connected with the phenomenon which is known as electricity. It is a privilege to join in a tribute to Mr. Edison on the fiftieth anniversary of his invaluable gift to the world."

PROFESSOR EDWARD L. NICHOLS

With the calm and sincere vocabulary of the scientist, Professor Edward L. Nichols, Professor Emeritus of Physics at Cornell University, expresses his feeling toward the meaning of Light's Golden Jubilee. He was with Mr. Edison at Menlo Park from 1880 to 1881.

"An appropriate commemoration of an outstanding and notable development," he stated.

HENRY FAIRFIELD OSBORN

Henry Fairfield Osborn, in a message directed to Mr. Edison, gives an interesting angle to his praise of the inventor:

"It is a privilege to know you in person and to share with the world in messages of honor and esteem.

"Fiat Lux, let there be light all over the world, and there has been light for fifty years, replacing in the hours of darkness from pole to pole the Sun, which came with the first *Fiat Lux.*

"You may not recall a remark you made to me at George Eastman's last spring. You said, 'You are interested in the great past, Eastman is interested in the great present. I am interested in the great future!'

"May your future be as happy and fruitful as Eastman's present and Osborn's past."

GENERAL JOHN J. PERSHING

The appropriateness of paying tribute to Mr. Edison while he lives is emphasized by a man famed in a service whose members are rarely honored until after death. There is a strong touch in the writing of General John J. Pershing's statement.

"There is no question that Mr. Edison's development of the incandescent lamp has brought a greater measure of happiness, contentment, advancement and benefit to humanity than any other single discovery," said General Pershing. "When we think that it has penetrated to every quarter of the globe and has carried to benighted peoples what may be well called 'the light of the world,' then, and only then, can its importance be fully appreciated. It is entirely fitting that his accomplishment should be fully recognized by mankind while he still remains among us."

MICHAEL PUPIN

What the significance of Mr. Edison and his works is in the field of science is described by Michael I. Pupin. He said:

"Light's Golden Jubilee is a fitting occasion to say a few words about Thomas Alva Edison's great achievement in the perfection of the incandescent lamp.

"A noted wit described once Mr. Edison's greatest achievement in the following three words—*'Filament in vacuo.'*

"But a whole book could be written about the vast amount of work which Mr. Edison and his assistants had to perform in order to get the right kind of filament and the right kind of vacuum.

"The noted wit, who succeeded in formulating the shortest description, omitted to mention a very essential element in Mr. Edison's electrical lighting system. This element represents another epoch-making achievement. It is the invention and development of the low resistance dynamo-electric machine which fed the incandescent lamps, all connected in parallel. This invention, added to the perfected incandescent lamp, gave us the incandescent lighting of today.

"The incandescent lamp, therefore, together with Mr. Edison's power distribution system between circuits connected in parallel, is Mr. Edison's great achievement which we are celebrating in Light's Golden Jubilee."

JOHN D. ROCKEFELLER, JR.

John D. Rockefeller, Jr., views the celebration of the anniversary as an occasion for counting the blessings which the invention has bestowed upon mankind.

"Thomas A. Edison's invention of the incandescent lamp fifty years ago was much more than a scientific invention. It was the beginning of a new era in electricity, a natural force having infinite possibilities of usefulness was to be harnessed by man and made to serve him in countless ways. This celebration of Light's Golden Jubilee leaves us to reflect upon the blessings which the electric light has brought to millions upon millions of people throughout the world."

DOCTOR STEPHEN S. WISE

From Dr. Stephen S. Wise comes this encomium:

"Servant of Light!—what high and honoring title. Light bringer—such is Thomas A. Edison—yea, even fashioner and creator of Light! Men rise up and call him blessed—who hath rendered services immeasurable to humankind."

A Human Sort of Person

By AMPLIFIER

I SOMETIMES wonder if, in all of the enthusiasm over this splendid national and international celebration known as "Light's Golden Jubilee" in honor of Thomas A. Edison, there is not a tendency to create a symbol out of a living man which, instead of bringing him closer to the American people for whom he has done so much, may make him more remote and cause the public at large to forget that, after all, he is a very human sort of person as those who have been associated with him for many years have testified again and again.

There also seems to be some inclination to consider the celebration as a matter belonging peculiarly to the light and power industry because of the fact that 1929, being the fiftieth anniversary of the first practical incandescent lamp and the laying of the corner stone of that industry; has been tagged Light's Golden Jubilee. But it is something more than that, and I am quite certain that the leaders of the industry, particularly that group known as the Edison Pioneers, would be the first to agree. It is, in the first instance, a celebration in honor of a very great American citizen—a man who has made a greater contribution to the advancement of the social, economic and industrial life of the whole world than any other one individual, but one who, I suspect, likes to be treated as a human being rather than as some sort of a monument set up as an example of what an American citizen can do.

IN this connection, the most charming note which has been struck among all the many things which have been said about Mr. Edison during the past few months will be found in an address by Charles L. Edgar, president of the Edison Electric Illuminating Company of Boston, delivered on Edison Day at the 52nd convention of the National Electric Light Association. Speaking on the Inspiration of a Name, Mr. Edgar said:

"While we have been amazed at the volume of his achievements, and spellbound by his energy and perseverance, we have been especially touched by the warmth of his affection. Though he may be acclaimed a leading scientist and inventor, though he may be pointed out as the highest type of American citizen, those of us who know him best will ever proclaim him, above all, a staunch and faithful friend. Always modest and of a retiring nature, he has not desired fame or honors, although his fellow men have praised him for his integrity of character, have honored him for his achievements, and loved him for his self-sacrificing regard for others."

His regard for others, and particularly for his associates, has characterized Mr. Edison's whole life. To him they have always been his boys—his pals. To them he has been "the old man." Quick to give credit for the assistance they may have given him in his work, it probably has never occurred to him to seek credit for himself. Intolerant of laziness, he has always been tolerant of failure if it were an honest failure, for much of his work has been based on the system of trial and failure.

TO get a real picture of Mr. Edison from his earliest childhood to the present time, one need only to turn to the new edition of "Edison—His Life and Inventions," which has just been published by Harper & Brothers. While presumably by Frank Lewis Dyer and the late Thomas Commerford Martin with the collaboration of William Henry Meadowcroft, long associated with Mr. Edison, it is a fascinating mixture of biography and autobiography, for much of the story is told in Edison's own words and, in fact, much of the manuscript was furnished in his own handwriting.

As a boy in public school Edison was not a success. In fact, his mother became very indignant on hearing that his teacher had referred to him as being "addled." She, herself, was a highly educated woman with long experience as a teacher and most of his education came from her. It seems that he had most of the ordinary experiences of a lively and intelligent boy. He fell into a canal and was nearly drowned. He fell into a pile of wheat in a grain elevator and was nearly smothered. Holding a skate strap for another boy to shorten with an axe, he lost the tip of a finger. He built a fire in a barn, but the flames spread so rapidly that, although he escaped himself, the barn was wholly destroyed, and he was publicly whipped in the village square as a warning to other youths.

Even at the early age of ten years all the boy's inclinations were toward chemistry and, though it may seem like heresy, he became an electrician only by chance. One of the earliest stories about his boyhood is that he induced another boy, employed by the family, to swallow a large quantity of Seidlitz powders on the theory that the gases generated would enable him to fly. The agony of his victim attracted attention and once more he was soundly thrashed—this time by his mother. However, he was not discouraged as he blamed the other boy rather than the motive power.

Young Edison when only eleven had a truck garden which he worked with the help of Michael Oates, the victim of the flying experiment. They had the use of a horse and small wagon and peddled onions, lettuce, peas, etc., through the town. As much as $600 was turned over to his mother in one year from this source.

But the youngster didn't like agriculture and about the time the Civil War broke out he managed to get permission to go on the local train as a newsboy. This train ran from Port Huron to Detroit, a distance of about 63 miles. There are a score of interesting stories about him during this period but none more significant than his reaction to the sensation caused by the battle of Shiloh, or Pittsburgh Landing, in April, 1862, in which both Grant and Sherman were engaged.

WHEN Edison reached Detroit on the day the news was received he noticed that the bulletin boards of the newspapers were surrounded by great crowds. He knew that there must be the same amount of excitement in all of the small towns along his run and decided that instead of selling the usual one hundred papers he could sell a thousand. Going to the office of the Detroit *Free Press* he boldly said he wanted one thousand papers but that as he only had money enough for three hundred they would have to give him credit. He then explained an idea he had, which was to telegraph the news ahead and have it posted on bulletin boards.

He got his thousand papers and started on the return trip. At the first station he found a crowd, thanks to his scheme of telegraphing ahead, and instead of selling only two papers he sold thirty-five. At the next station he found a still larger crowd and promptly raised the price of his papers from five to ten cents. At Port Huron he raised the price to twenty-five cents and sold out, making what was to him, as he says, "an immense sum of money."

Such were a few of the interesting episodes in his boyhood. The origin of his deafness and, incidentally, his own attitude toward it, is best told in his own words: "My train was standing by the platform at Smith Creek's station. I was trying to climb into the freight car with both arms full of papers when the conductor took me by the ears and lifted me. I felt something snap inside my head, and my deafness started from that time and has ever since progressed."

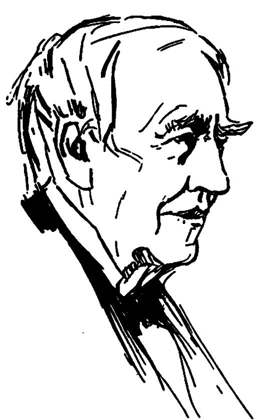
"This deafness has been of great advantage to me in various ways. When in a telegraph office I could only hear the instrument directly on the table at which I sat, and unlike the other operators, I was not bothered by the other instruments. Again, in experimenting on the telephone, I had to improve the transmitter so I could hear. This made the telephone commercial, as the magneto telephone receiver of Bell was too weak to be used as a transmitter commercially. It was the same with the phonograph. The great defect of that instrument was the rendering of the overtones in music, and the hissing consonants in speech. I worked over one year, twenty hours a day, Sunday and all, to get the word "specie" perfectly recorded and reproduced on the phonograph. When this was done I knew that everything else could be done—which was a fact. Again, my nerves have been preserved intact. Broadway is as quiet to me as a country village is to a person with normal hearing."

WHAT of Mr. Edison at the age of 82? Is he still the very human boy or has he become, because of the manner in which he is being exalted, an individual aloof? This can best be answered by quoting from a speech made by Mr. Elmer A. Sperry, president of the American Society of Mechanical Engineers, who presided at the organization meeting of the N. E. L. A. in 1885.

Shortly before his 82nd birthday Mr. Edison invited a few members of the Naval Consulting Board to come over and see him, among them Mr. Sperry. "When we came in," says Mr. Sperry, "he spied me with a cane. He said: 'Sperry, what are you doing with that cane?' I tried to explain that it was only a bad habit of mine that I had recently acquired. He said: 'I have no use for a cane, now see me kick.' He jumped up out of his chair and kicked higher than his shoulder."

"Later on," continues Mr. Sperry, "we went out about half a block in the rain, Mr. Edison without any hat, to a building where he was working on the seventeenth thousand series of plants. He had examined no less than 16,000. He showed us a plant yielding 9.6 per cent rubber, found in a canyon in Arizona. He took from his shelves in a back room notebook after notebook. There seemed to be at least forty of them, some of them in his own handwriting. They were the record of these plants. Full of activity, he said, with all the charm of his whimsical smile, 'I had to clear out my chemists from this laboratory; they knew too much. I had to get a fresh lot in, mostly youngsters'."

While literally hundreds of personal incidents about Mr. Edison are being told and retold I cannot resist the temptation to tell one of my own. A few years ago I was commissioned by a national review to write a series of articles entitled "Grading Human Beings." At about that time Mr. Edison was very much interested in intelligence tests and I decided to write one of these articles around him. I arranged for an appointment and he agreed to give me three hours.



John Alonzo Williams

Ushered into the two-story library connected with his laboratory I found Mr. Edison seated at a great, old-fashioned, oak roll-top desk. Shaking hands in a genial fashion he waved me to a chair with, "Well son, what can I do for you?"

I had written out a statement as to just what this series of articles would try to prove and at the same time had written out some 35 questions, each one on a separate sheet of paper. This method of interviewing seemed to please him, for he went to work on them at once. In each instance he wrote out the answer with the stub of a lead pencil and in each instance he elaborated his answer with a discussion. One question seemed to puzzle him for a moment. At that time Mr. Hoover was chairman of what was then known as "The National Conference on Street and Highway Safety," which had for its purpose the reduction of street and highway accidents. This question, as I remember it, simply asked Mr. Edison if he had any thoughts on the matter.

After a few moments he scratched his head and said: "Well, son, I guess that when human beings acquire the intelligence of army mules there won't be any more street and highway accidents."

We are apt to think of Mr. Edison in terms of the incandescent lamp and the phonograph. A list of his own inventions and his contributions to the inventions of others, with even the briefest of descriptions, would fill more than one volume. For example, he assisted Sholes, the inventor of the typewriter, to make the first successful working model. His invention of the quadruplex system of telegraphy saved the investment of many millions of dollars in wires. He discovered a previously unknown and unique electric phenomena, which he called "Etheric Force" and which became the foundation of wireless telegraphy. As long ago as 1883 he made a discovery which today covers the foundation principle on which every modern radio lamp (or tube) is based.

IN 1876 he invented the carbon telephone transmitter which made telephony a commercial art. This invention included the microphone which makes radio possible. He not only invented the first practical incandescent lamp, but invented radical improvements in the construction of dynamos, making them suitable for generators for systems of distribution of current.

In 1891 he invented the motion picture camera and 21 years later introduced the kinetophone or talking motion picture.

One could go on indefinitely listing his accomplishments which have had their effect on a score or more of industries. During the World War he worked on some 42 major problems as president of the Naval Consulting Board, giving up his entire time to this work for two years. With it all he has remained, as Messrs. Dyer, Martin and Meadowcroft put it toward the close of their great work on Edison, "a plain, easy going, placid American, with no sense of self importance, and ready at all times to have his mind turned into a lighter channel." No one is more impatient or intolerant of interruption when deeply engaged in some line of experiment, but, generally speaking, "Edison is easy tolerance itself, with a peculiar weakness toward those who have the least right to make any demands on his time. Man is a social animal, and that describes Edison; but it does not describe accurately the inventor asking to be let alone."

Without doubt, "Light's Golden Jubilee" will leave Mr. Edison as it found him and as I found him—a plain, easy going, placid American with a strong sense of humor and only impatient when interrupted at a time when he is working on some problem. Incidentally, I am quite sure this is the character he would like to play in the minds of the American people.

Light's Golden Jubilee

By JOHN F. QUINLAN

Executive Secretary, Light's Golden Jubilee National Committee

THE great international observance of Light's Golden Jubilee, marking the 50th anniversary of the invention of the first practical incandescent lamp by Thomas A. Edison, has been welcomed and supported by leaders of thought everywhere. The President of the United States, Herbert Hoover, when accepting the Honorary Chairmanship of the National Sponsoring Committee said *"I shall be delighted to serve in any capacity which will be a genuine tribute to Mr. Edison's services."*

Light's Golden Jubilee will be just as much an occasion for serious retrospect, profound appreciation and genuine inspiration as it will be a celebration, gala, festive, and jubilant. It will be a celebration exclusive to no one company, to no one industry, nor will it be limited to any single nation. It is upon a grateful people of the world that the blessings of Edison's genius have been showered. Light's Golden Jubilee offers the electrical industry a golden opportunity to join hands with the world at large in standing beside the man who gave the world light without flame, the man whose life is an inspiration to all, the man who stands for all that is American and good. Individually and collectively the men of the electrical industry owe it to themselves to make Light's Golden Jubilee the greatest tribute ever paid a living man.

Light's Golden Jubilee received its first formal suggestion on Edison's 82nd birthday. At a luncheon of the Edison Pioneers that gallant body of men who were associated with Edison in his pioneering days—their fellow member Dr. John W. Lieb, tentatively outlined the celebration. The Pioneers then unanimously approved the following resolution:

> "Resolved, that the President of the Edison Pioneers be requested, and he is hereby authorized to appoint a committee of five from its membership to propose to the electrical industry at large, the organization of a Sponsoring Committee which may prepare plans for the appropriate celebration of the Golden Jubilee of the Incandescent Lamp occurring during the year 1929."

The preliminary light festivals this summer have been notable. Light's Golden Jubilee was brilliantly inaugurated at Atlantic City on May 31. There hundreds of thousands of visitors joined the residents of the community who turned out en masse to witness a gorgeous spectacle of light and color in which land, sea, surf, and sky mingled and were bathed in all the hues of the rainbow. In the presence of Vice President Curtis, Preston S. Arkwright, at that time president of the National Electric Light Association, delivered the stirring address which opened the ceremonies.

Two weeks later the City of Niagara Falls dedicated its Fifth Annual Festival of Light to the celebration of Light's Golden Jubilee. All the principal streets were suffused with golden light, and the falls were illuminated by a battery of searchlights aggregating 1,440,000,000 candlepower. The Pageant Parade held on the evening of June 13, which opened the celebration, held hundreds of thousands of spectators fascinated for hours. The whole city was in festive attire, flags were flown, store-windows were especially decorated for the occasion, and Edison's photograph was displayed everywhere.

Saturday, August 31st, was Edison Day at the National Air Races, Cleveland. At 10 o'clock in the evening an open air show was held, attended by a number of distinguished guests and over 15,000 people. The program included: tributes to Edison by leading men in aviation; the Light's Golden Jubilee Derby, a race of air-mail pilots to Milan (Edison's birthplace) and return; a musical show featuring George M. Cohan's song, "Edison Miracle Man;" and a parade of girls representing the various stages of light down through the ages coming to a climax with the modern incandescent lamp and the unveiling of a large photograph of Thomas Edison. All of the festivals that have been mentioned were broadcast over nation-wide hook-ups.

The opening night of the National Convention of the American Legion, our country's largest convention, to be held in Louisville, Kentucky, September 30 to October 3, will be dedicated to Thomas A. Edison and Light's Golden Jubilee. Plans are to make it the most brilliant and colorful convention ever held. Because of Louisville's central location more than 100,000 visitors representing every state in the union and twelve foreign countries are expected to attend. Thirty-nine blocks of the business district of Louisville will be decorated and special golden lamps will light the district.

Captains of industry and finance, and a distinguished group of men and women representing practically every walk of life in America make up the personnel of the National sponsoring committee. Mr. Henry Ford considers Light's Golden Jubilee "his job of the year" and made this comment to the writer recently when he visited Mr. Ford at Dearborn, Michigan. The marked enthusiasm with which Mr. Ford has entered upon the task of giving to the world the story of what Mr. Edison's accomplishments mean to humanity indicates the deep, sincere affection which he has for Mr. Edison. All of us are familiar with Mr. Ford's manner of doing things, and it is safe to say that the culmination of Light's Golden Jubilee at Dearborn on the night of October 21 will be recorded as one of the finest tributes every given to any living person.

Meanwhile, great preparations are being made. From large cities and small towns in every part of the land, and from many distant lands as well, comes information that committees are being organized to formulate plans for local observance. Street parades, lighting festivals, floodlighting of public buildings and dwellings, special fireworks displays, dinners, and meetings and numerous other activities will be the order of the day and evening. In some parts of the country complete sections are being organized, as in New England. One state has its Governor as chairman of a state-wide committee. The Mayor of New York heads the sponsoring committee for that city.

Besides the acceptance of the Honorary Chairmanship by the President of the United States, our Government has issued a special two-cent postage stamp to commemorate the occasion. The manner in which this stamp has been received by the country at large is evidence of the great interest on the part of the public. Three hundred and thirty million stamps have been purchased since June 5. Stamps will be on sale during September and October in sheet and coil form. Owing to the unprecedented demand for coils, the Post Office Department has now decided to issue the stamps in coils of 3000.

Literally, hundreds of letters have been received from chambers of commerce, women's clubs, fraternal societies, city officials, and other organizations requesting information as to how they might be of assistance in promoting interest in their communities. Every request has been acknowledged. Governors of Arizona, California, Florida, Idaho, Indiana, Kentucky, Maine, Maryland, Massachusetts, New Mexico, Michigan, New Hampshire, New Jersey, Ohio, Oklahoma, Oregon, South Carolina, Texas, Utah, Wisconsin, and Wyoming, will issue proclamations or statements to the press prior to October 21. A number of foreign embassies at Washington will fly the flags of their countries as well as illuminate their buildings. So, truly, our country will *stand by* in honor of electricity's milestone and the universal progress made in the short span of fifty years.

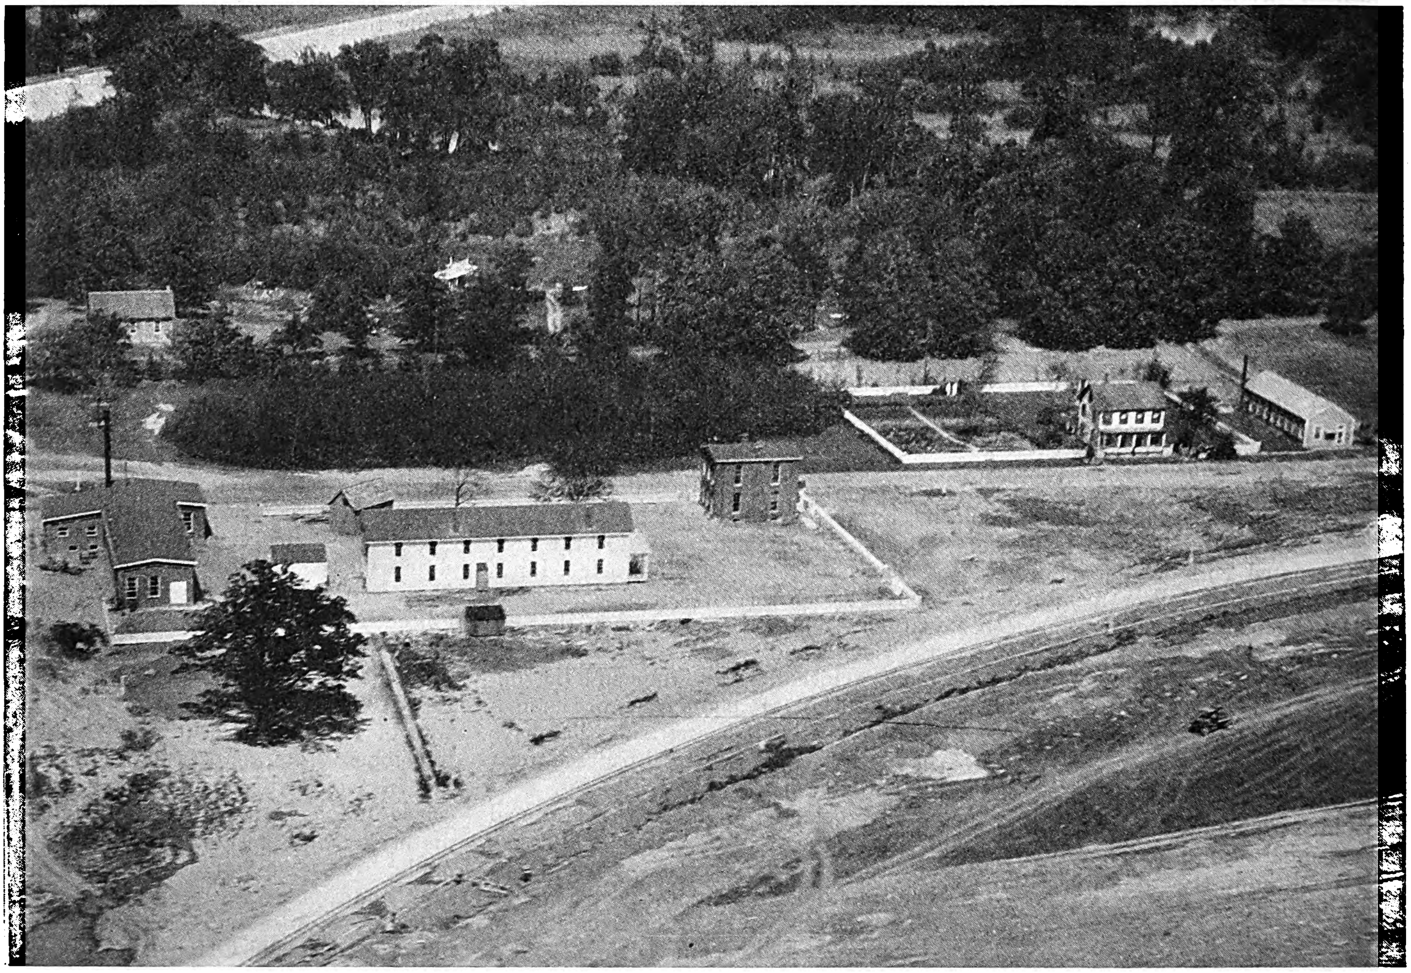
The general plans for the celebration at Dearborn are mentioned elsewhere in this issue. If you have not read them, by all means do so in order that you and your family may be at your radio on the evening of October 21. While details will be carried by the press, on October 21, central stations are urged to make suitable announcements locally calling further attention to this important program.

Light's Golden Jubilee will be magnificently supported by beautiful colored sections in the *Saturday Evening Post, Colliers Weekly* and the *Literary Digest*. What will be termed the greatest thing yet done in advertising will appear in these publications which will be available several days prior to October 21. All of these pages will be in the nature of a tribute to Mr. Edison from those branches of the electrical industry which have come about as the result of his inventive genius.

A Speakers' Bureau has been organized to care for the numerous requests which are being made for speakers to address gatherings which are being held in all parts of the country. It is estimated that several thousand addresses will be given before chambers of commerce, Rotary, Kiwanis and other civic organizations, association meetings, etc. Requests for speakers should be addressed to Mr. W. M. Skiff, National Lamp Works, Nela Park, Cleveland, Ohio. In addition, plan books, publications containing suggestions for pageants, floats, arches and decorative material are available at small cost at the Executive Headquarters of Light's Golden Jubilee Committee, 420 Lexington Ave., New York City.

The central stations of the country will take an active part in the celebration in order to show their appreciation of the man whose works mark the beginning of the electric light and power industry. Many companies in various parts of the country have assured the committee of cooperation in their respective communities.

Every light and power company will have a twofold opportunity. First, of active direct participation and, second, of encouraging others to take part.



MENLO PARK AT DEARBORN

The workshops and other buildings used by Mr. Edison and his assistants while working on the incandescent lamp at Menlo Park, N. J., have been transported by Mr. Ford and re-erected as a part of the great Industrial Museum at Dearborn, Mich. Reading from left to right, in the foreground are the machine shop, carpenter shop, glass house, laboratory building, office building and Mrs. Jordan's boarding house. At the extreme right is the Fort Myers, Fla., laboratory of Mr. Edison. In the background is the little red schoolhouse attended by Mr. Ford in his youth.

A STATEMENT

By HENRY FORD

There could be no greater satisfaction to me than to aid in paying tribute to Thomas A. Edison, whose remarkable achievements in our lifetime have so materially contributed to the advance of civilization throughout the world. His unselfish and untiring efforts to serve mankind make him today the greatest of all living Americans.

The Celebration at Dearborn

By N. H. BOYNTON

HENRY FORD expressed the thought early in the year that Light's Golden Jubilee would be sort of a national tonic as a tribute of an industrious nation to the industry of one man, and so it is proving to be. The whole-hearted accord, in America and abroad, with which Light's Golden Jubilee has been accepted and is being celebrated, has probably exceeded the dreams of the most devoted admirers of Thomas Alva Edison. The fondest hopes of those of us closest to the movement last spring are being more than realized. Universal consciousness of the great debt to Mr. Edison is no longer figuratively phrased—it is literally a fact.

WITH city after city swelling the Jubilee refrain throughout the summer and fall, with national event after national event devoting large portions of their programs to Edison tributes and Light's Golden Jubilee activities, the problem of a climax would appear to be something to reckon with. Of course, the fact that cities and towns throughout the world will celebrate the 1879 invention simultaneously on the night of October 21, is in itself decidedly climactic. It is beyond the most imaginative of us to visualize that event.

But the world's interest on the night of October 21 will center upon a quaint, modest "typical American village" at Dearborn, Mich., where Henry Ford, Edison's bosom friend, will entertain Mr. Edison, The Edison Pioneers, and a group of noted personages who are the friends of Mr. Edison and Mr. Ford, and who are deeply concerned in honoring Mr. Edison on this most memorable occasion.

At Dearborn Mr. Ford has assembled with consummate care and accuracy, the earliest developments in every walk of American life and society. He has gone to incalculable expense and effort to reclaim originals, or where necessary, to religiously reproduce them. Another such collection does not exist. In celebrating an anniversary of any event famous in American history, no finer setting could be selected.

BUT there is more to the perfect propriety in the party for Mr. Edison on Oct. 21. With Mr. Ford, every effort which he has put forth in honoring and preparing to honor Thomas Edison, has been a distinct labor of love. Mr. Ford has long been an ardent admirer and friend of the master inventor. Accordingly, it has been with an amazing personal devotion that Mr. Ford has brought about the removal of Edison's Menlo Park and Fort Meyers laboratories to Dearborn. Around these famous buildings he has assembled a typical American village, complete from village tavern to town hall and blacksmith shop. He has reproduced Independence Hall. He is creating the Edison School of Technology. These buildings are practically complete; many others are nearing completion.

Dearborn is a scene of bustling construction, of meticulous reproduction. Each time I visit Dearborn, new wonders await my eyes. The project is beyond description. When the eyes and ears of the world turn to Dearborn on the night of October 21, they will find a perfect demonstration in a perfect setting.

THE program itself, at Dearborn, is modest. Members of the party will be brought from Detroit to Dearborn on the afternoon of October 21, traveling on a fifty-year-old train. During the day, the Edison School and Museum will be toured, along with the typical American village. A banquet will be served to the guests in the early evening at Independence Hall.

Following the banquet, the group will adjourn to Menlo Park laboratory, where the climax of the great celebration will occur. There, in company with distinguished men and women in his familiar original laboratory, Thomas Alva Edison will reconstruct the lamp of fifty years ago and make the electrical connection to it which will cause it to light. The re-enactment of this momentous occasion will be shared not only by the distinguished gathering in the laboratory but by an interested public, who will be in attendance through the radio description which will be broadcast to them.

THE world will hear the description of this event, produced over an international radio hook-up. The world will take the lighting of the 1879 lamp by Mr. Edison as a signal to festoon itself in gala light. Homes where families have sat in darkness listening to the radio broadcast, will blaze in the warmth of modern lighting.

But the party at Dearborn will never be well described. It will be the re-reading of a faded, beautiful page in an American epic. It will be the tribute of the great to the great. While famous men stand humbly in darkness, a smiling old man will live again in terms of the past—then he will touch a mechanism, and the world will be aglow. The climax to Light's Golden Jubilee at Dearborn will be an unforgetable tribute to the world's hero of industry.

PRESENT OFFICERS *of the* EDISON PIONEERS

The Edison Pioneers

By W. H. Easton

A LITTLE group of men, most of them past the three-score mark, will go to Dearborn in October as guests of Henry Ford to attend the celebration of Light's Golden Jubilee, in honor of Thomas A. Edison and the fiftieth anniversary of his incandescent lamp. The celebration will hold special significance for them, for they are the Edison Pioneers, an organization like no other in the world.

A small remnant of the glorious days of great achievement—brought together solely by sentiment—the Edison Pioneers serves no purpose but to honor the man who has always been a hero to his associates. They wish no more than to keep alive precious memories of those hard driven days when the faith and loyalty of his staff stood between the genius of Edison and the doubts of the world.

To Dearborn they will go then, from all over the United States and from many points in Europe. Henry Ford, their host, is himself a Pioneer. Less than 40 years ago, Ford—clad in overalls, was an employee of the Edison Central Station in Detroit at a very modest wage. Many pioneers who began their business careers in the Edison Laboratories, are now men of important affairs. Others, however, are living in retirement and because of the infirmities of age will not be able to attend the Dearborn festivities.

The organization boasts some 250 members today, but each year decreases the membership sadly.

There are four groups of members. Members outright are those who were in Edison's employ prior to 1886. Of these there are only about 20 now living who shared in the busy days at Menlo Park where the electric light was perfected and the phonograph first recorded the human voice. Associate members were in the Edison organization between January, 1886, and January, 1900. They too have a rich store of memories for they witnessed the growth of the Edison organization to fame and prosperity. Descendant members are sons or daughters of members or associated members. Mr. and Mrs. Edison and the Edison family are the honorary members.

Eleven years ago, four Edison men of long standing service decided to round up all the surviving old timers, particularly those who had a share in the exciting days of the eighties. A call was issued for a meeting in the rooms of the United Engineering Society in New York City. Twenty-eight responded. It was a strange little gathering—men who had not seen each other for decades assembled again because of a common affection and admiration for their erstwhile leader.

It was there and then, on Jan. 24, 1918, that the Edison Pioneers was formed. Gradually, others who were eligible, were located and added. Although some have drifted far afield, many have continued and still are Edison men. It is an unique group in this land of countless organizations. The mere fact that its birth occurred during Edison's lifetime and that it exists only as a tribute to him, puts it in a class by itself. Many organizations spring into being after a popular hero passes on, but rarely do men express themselves in this way during the hero's lifetime.

THE Edison Pioneers places slight tax upon its members, either socially or financially. Dues are nominal and the only meeting is the annual luncheon on Feb. 11, the birthday of Mr. Edison. This occasion is frequently attended by Mr. Edison and members of his family. If he is not present, Mr. Edison always sends some gracious word to his old associates.

Following the luncheon, the annual election of officers takes place and the business of the group is discussed. This annual occasion is always fraught with drama, for each year the ranks are thinned, and each year also, some fellow worker of early days has been dug out of obscurity and drawn into the group. These reunions are happy occasions for Pioneers who have suffered the passing of so many friends.

Although there is only the one meeting during the year, the headquarters of the Edison Pioneers at 40 West Fortieth Street, New York City, is open every day, except Sunday. It has become the mecca of all Edison Pioneers whenever they reach New York. Presided over by Frank A. Wardlaw, secretary since 1921, this office has meant many things to many members. It is above all a place where there is always a cordial welcome and warm friendliness.

Mr. Wardlaw, who entered Mr. Edison's employ in 1881, keeps a keen watch over his little membership. If there is sickness, he visits the ailing member, often going far and wide on his errands. Flowers and personal letters are sent whenever a death occurs. And if it is simply a matter of an hour's chat with some lonely Pioneer, Mr. Wardlaw has the sympathy which gives good cheer to the visit.

A veritable storehouse of Edisonia is that headquarters. Its wall's are lined with handsome paintings and portraits of Mr. Edison at various stages of his career. One wall is devoted to portraits of the presidents of the Edison Pioneers.

Officers of the Edison Pioneers for the current year are, president, W. S. Barstow; vice-presidents, F. P. Ott, J. F. Porter, James M. Seymour, F. W. Jesser; treasurer, Charles E. Estabrook; secretary, Frank A. Wardlaw; historian, William H. Meadowcroft. The executive committee includes: John W. Lieb, Frederick A. Scheffler, John W. Howell.

The honorary members are Mr. and Mrs. Thomas A. Edison, Mrs. Marion Edison Oser, Thomas A. Edison, Jr., William Leslie Edison, Charles Edison, Mrs. John E. Sloane and Theodore M. Edison, and the three grandchildren: John Edison Sloane, Thomas Edison Sloane and Peter Edison Sloane.

The members who were with Mr. Edison prior to 1886 include the following:

A Brief Pilgrimage into Internationalism

The author of this article has been for many years an observer of affairs which have international aspects and has spent much time in Europe having been connected, at one time, with a branch of the League of Nations. He has been frequently quoted as an authority on some of the subjects which he discusses.

ANY discussion of the international aspects of national problems, or the international phases of this or that unit in our economic structure, is almost sure to subject the one who initiates it to adverse criticism on the part of a type of American citizen who firmly and sincerely believes that Washington's warning against entangling alliances means to beware of *all* association with other nations, and that true patriotism means the *complete isolation* of the United States. Sooner or later he will be accused of "internationalism," which his critic interprets to mean some form of international brotherhood of man to the exclusion of all national emotions, and which must lead, eventually, to some form of radical socialism and even to communism in its most objectionable form.

Nevertheless, the day has gone when any nation can draw a line around itself and say to all the world, "Everything within these boundaries belongs to us and is of no possible interest to anyone outside them, just as everything within your boundaries belongs to you and has no possible interest for us." One might as well say that everyone living within a community is privileged to draw a line around his house and lot, saying: "Whatever I may do within these limits is nobody's business but my own." Such a state of affairs would mean the end of civilized society as we know it today and a return to conditions which existed before individuals and their families first began to gather together in tribes.

IT is with a full knowledge of the fact that I may be accused of a leaning toward this so-called "internationalism" that I shall discuss briefly the international aspects of Light's Golden Jubilee, as well as the international aspects of electrical science. Before I do this, however, I wish to call attention to the international aspects of various other matters which we are inclined to think of as having only a purely national interest, in order to establish the fact, if possible, that certain phases of our existence know no boundaries.

Suppose we take, for example, an unemployment crisis. There are certain aspects of the unemployment situation in many countries which are, to a certain extent, international in character and which must be taken into consideration when studying the problem in any particular country. These indicate that the causes and effects of an unemployment crisis in any country are by no means confined to the territory within the frontiers of that country. They have regard to economic forces which cross frontiers, as, for example, the fluctuations in trade and financial crises (originally local or even artificial) spreading to industry and becoming international, affecting employment in all countries through decreasing imports or exports and thus causing distress in those countries.

MANY people are inclined to think that the tariff on goods imported into the United States is a matter which is peculiarly our own business and that its effect on other countries will have no repercussion within our own boundaries. Only a few years ago Arthur Balfour, then head of a committee representing the high-speed tool steel industry of Sheffield, England, said that if a proposed tariff on steel (then in a tariff bill which was being constructed) remained, half the manufacturers in Sheffield would be forced to close, thus adding to the already heavy unemployment in England. This would mean, in the first instance, a lessening in the amount of high-speed tool steel imported into this country and, therefore, to some extent lessen our own productive capacity. In the second instance, any increase in unemployment in foreign countries must mean a reduction in its purchasing power and therefore a lessening of our own exports to that country, adding to our own unemployment.

Take the problems arising out of our immigration policy and the restrictive clauses in our immigration laws. Any reasonable person will admit that we have the right to deny admission to this country of those citizens of other nations who we think will not make desirable citizens of the United States, and to admit those whom we think we would like to have. Failure on our part to restrict immigration would weaken our economic structure in a few months.

But there is a distinct international angle to the manner in which we administer these immigration laws. There is the almost age-old question as to whether we should inspect the immigrant at Ellis Island or at the source, that is, at or near his domicile. If we should inspect at the source we would eliminate all of the hardship involved in refusing admission after the immigrant has broken up his home, sold all of his belongings and traveled three thousand miles or more, only to be returned, an economic loss to himself and his country. This, however, is a problem which cannot be solved without the cooperation of other nations, and will never be solved until we can feel secure in adopting the principle of examining the international aspects of what may seem to us to be our own national problems.

We are extremely fond of comparing our own economic and social situation with those of other countries by elaborate tables of statistics. But statistics, as we know them, are hardly comparable with the statistics of any other country. Statisticians of our own country cannot agree as to nomenclature and interpretation of figures and, if this is true, how can we expect the statisticians of countries throughout the world to be agreed as to how they should keep their figures and as to what they may mean. Ask twenty statisticians to produce tables regarding the world's production of power and you will have twenty different tables, none of which will agree.

WHEN we turn to the realm of science we enter a field which knows no national boundaries. Science is international, and its product belongs to no one nation, or race, or people. Even though we may be celebrating Light's Golden Jubilee in honor of Thomas A. Edison, we cannot, by the furthest stretch of the imagination, claim that electricity is peculiarly an American product, nor can we claim that the benefits of Mr. Edison's great work belong to us and to no other nation. In this connection, the words of His Excellency, Dr. Alberto Pirelli, President of the International Chamber of Commerce, addressed to the 52nd convention of the National Electric Light Association, are interesting. He said:

"Mr. Edison happens to have been born in the United States, but he belongs to the world. It would be idle for me to dwell on his many and beneficent inventions. Labor has been incessant with him, and his life is a song of hope to the youth of all lands. For none of us lives unto himself. Centuries ago a great poet of my own country expressed it thus: *Sic vos non vobis mellificatis apes.* That is to say, 'Not for yourselves, but for others do you produce honey bees.'

"As President of the International Chamber of Commerce I am happy to voice the admiration of business men of forty-six nations, for the work of the inventor and for the development of scientific research. And in no place is this work more manifest than in the United States.

"One great asset of electricity is that it has enabled countries like Italy, Switzerland, Norway, Sweden and others possessing little or no coal to develop their water powers for civic, domestic and industrial use, and has also made possible the conservation of other natural resources, to the great advantage of civilization. It has brought untold benefits to industry and commerce, and has provided comforts and leisure for the home, so that great multitudes enjoy a freedom and a dignity beyond that which earlier civilizations allowed. And for much of this the world is indebted to the inventive genius of Edison.

"Years ago Beethoven was conducting a performance of his Ninth Symphony. So moved and entranced with the beauty and majesty of the music did the audience become that they stood and applauded the composer enthusiastically. But Beethoven heard not, heeded not; for his ears were deaf to their cheers. For years Edison also has lived in that silence which Ibsen calls 'the home of the strong' and my hope and heart's desire is that if he cannot hear, he may at least sense how great is the gratitude of a world which this day salutes and cheers him as one of its worthiest inhabitants."

Doctor Pirelli is an Italian. He might very well have mentioned the fact that it was the experiments of Galvani, an Italian physician, which led Allesandro Volta, another Italian, to the discovery of the Voltaic pile and of voltaic or galvanic electricity. He might have said that Volta was thinking about the principle of the electric telegraph in 1777. Or, if he wished to pursue his thought that Edison and the science of electricity belongs to the world and not to any one nation, he might have called attention to the fact that the Leyden jar was presumably a product of a bishop of Pomerania, that a Swiss physician was thinking about the telegraph in 1773, as was a Scotsman in 1753. The Chinese are supposed to have used the magnetic compass as far back as 2637 B. C., while Dr. William Gilbert, physician to Queen Elizabeth, published in 1600 his "De Magnete," 106 years before the birth of Benjamin Franklin, the American, who established the fact that electricity and lightning are identical.

WHAT of the philosophy of the Far East? Sir Kengo Mori, the Chairman of the Japanese Delegation to the Reparations Conference, summed it up in a movietone address before the N. E. L. A. Convention, when he said:

"An invention whose advantages can be enjoyed by only one section of the community, or the people of one country, cannot be termed a true blessing in the sense that its beneficence extends to every man, every woman, the world over.

"I am one of these who were not so blessed in their youth. My studies were made under the oil lamp. I like to think that that time is not very long back, and it is certainly a very short time for the electric lamp to have made such remarkable progress, considering that according to the statistics I have, my country was lighted at the rate of one lamp for every two people in 1927.

"No later figures are available, which fact throws into a relief as clear as the illumination I am talking about, the rapidity of the expansion this public utility is making. Official statistics cannot keep pace with its progress.

"Let us hope that this wonderful creation may make still further progress in the days that are to come, and in its gathering strength bring light upon the questions which trouble mankind; and in the solution of which the West and the East must join hands."

Turning to the modern problems created by the development of the light and power industry, we find a famous Englishman, Sir Ernest Benn, joining with the thinking people of the United States in opposition to public ownership. Calling attention to the fact that Plato first advocated the public ownership of property, and that for twenty centuries "people who were not so well off as they would like to be have argued that there was something wrong with private ownership," he continues:

"The argument still goes on today, and yet the vast bulk of all the property in the world is still in private hands. We are asked to believe that the whole world has been wrong through all the ages and that there is a better way—the way of public ownership. It wants some courage in face of the accumulated experience of mankind to carry on this old argument, but Socialists and Revolutionaries make up in courage what they lack in brains."

And so, whether we like the word or not, we must, if we are to truly appreciate the meaning of Light's Golden Jubilee, translate it into terms of its international values. It is only by chance that Mr. Edison is a citizen of the United States. For many centuries citizens of many other countries conducted their researches and made their contributions to the foundation of electrical science which made his inventions possible. But to him is due the credit of taking the work of these other men and developing specific devices which have made untold contributions to the wearing down of the invisible but very real barriers of national prejudice that surround every nation. Through the outlets of science and commerce he has made a greater contribution to world friendship than all the diplomats that have ever been born.

Light's Golden Jubilee is a tribute to Thomas A. Edison, who belongs to the world. It is not a commercial activity where elements of personal advantage may enter, nor is it a diplomatic enterprise. It is one more stone in the structure which may make it possible for people all over the world to work together, plan together and think together. The value of international friendship is hard to overestimate.—E. G.

The Influence of Edison Upon His Associates

By FREDERICK A. SCHEFFLER

Member Executive Committee Edison Pioneers

I WAS a young man of 23 years, a draftsman, brought up in the locomotive business, just previous to my meeting Edison in May, 1881 and my subsequent employment by the Edison Company for Isolated Lighting (just organized).

In the years which followed my association with the Edison Company I learned that persistance, aggressiveness, disregard for the element of time in respect to a day's work, close attention to details, so many of them entirely new, and cultivating an acquaintance with patience that seemed almost impossible, were the things which saturated the mind of every man working for Edison. He was the personification of all of these things and if his associates did not embrace them all it was their own fault and they dropped by the wayside. I cannot remember that many whom I knew did drop out—the great majority stayed on doing their bit in the revolution that was quickly overwhelming man's daily existence, making life more enjoyable and in time reducing the hours of labor.

I believe that Edison's example as an indefatigable worker unconsciously impressed me—that is, one did not realize that he was absorbing the "will-to-work" idea, but eventually it became a natural thing to do—and my whole life has been thereby benefited, because at no time over a half century of years that I have been a worker, can I recollect that I have ever even wanted to quit working or lose my interest in any undertaking that I may have been engaged in. This is not said in a spirit of egotism, but it is necessary to bring out the point I am trying to make—that Edison has affected my whole life in this respect.

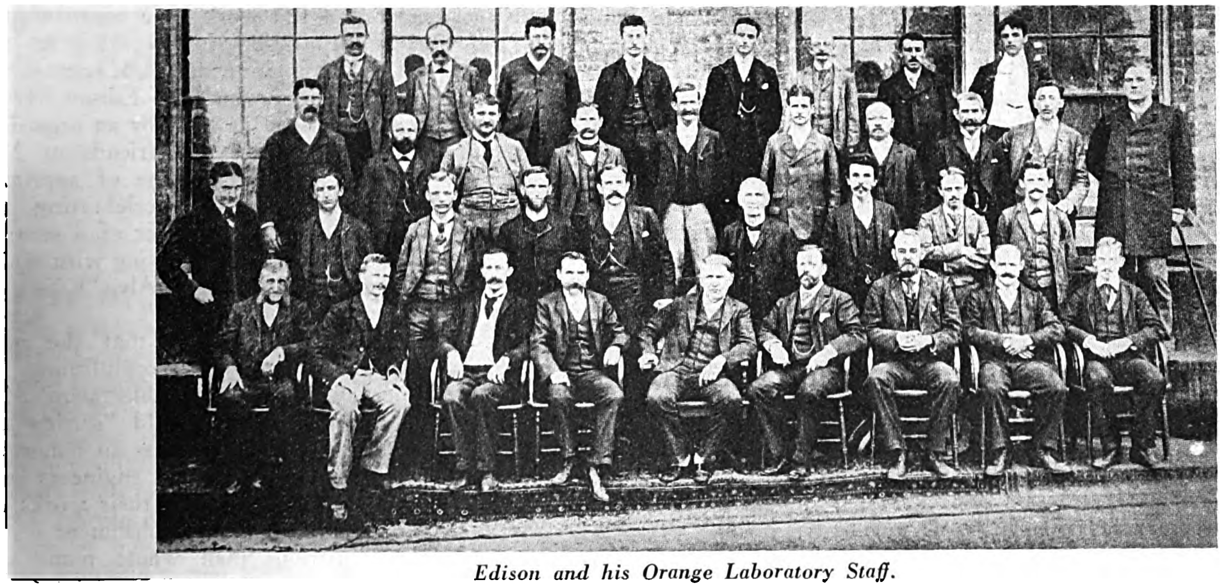
The fact that I had the good fortune in the early days of the electrical industry to become associated with the "old man" (Edison was so called even when he was only thirty-four years old by his associates, but whether he knew it or not I do not know) was also responsible for my becoming connected later with other similar manufacturing companies, in sequence. Westinghouse, Brush — through the T-H, and Sprague. These, together with my early connections with Edison, gave me an unequalled opportunity to make hosts of friends in all the different branches of the electrical, as well as mechanical industries, whose acquaintance and friendship I prize most highly. These connections also brought to me certain young men to whom I gave employment and who afterwards became great factors in the public utility industry, and they are kind enough to refer to this fact as occasion arises, but the credit for their prominent positions at the present time is all due to their untiring efforts and their close application to their business. Again, in this way, Edison has meant a great deal to me.

In a wholly different way, through love for the young "old man," his early associates have endeavored to perpetuate his name and life work by meeting once a year at a luncheon to celebrate his birthday, February 11th, under the name of the Edison Pioneers.

I little realized when I first suggested to some of my old Edison associates on Edison's 65th birthday in 1912, the idea of as many as possible of these men getting together annually on Edison's birthday for the sake of renewing old acquaintances and meeting Edison when possible, that such a small beginning would become the now world-wide known Edison Pioneers.

The start was made in a letter sent out in January of 1918, by four old Edison men, namely, Charles Wirt, Major William I. Hammer, Sidney B. Paine, and myself, to about 150 men located all over the world, whose addresses were rather dubious, but many responded. This letter called a meeting of those interested in forming an association. The meeting was held January 24, 1918, and the twenty-eight men attending organized the Edison Pioneers. The founder Pioneers are those who were associated with Edison prior to and including the year 1885. As that date occurred 44 years ago one can easily visualize the fact that there are not many still living who can qualify as founder members. At present there are only a few over 100 such members.

Had it not been for the extreme interest taken by the Association of Edison Illuminating Companies and the Electrical Testing Laboratories, and particularly the executives of these organizations, in the welfare of the Edison Pioneers, that expression of love for Edison would still be just a luncheon organization, instead of the well recognized and prominent factor it is today in the history of the electrical industry.



Edison and his Orange Laboratory Staff.

Edison and the Association of Edison Illuminating Companies

By PRESTON S. MILLAR

Secretary

THE Member Companies of the Association of Edison Illuminating Companies occupy a unique position with respect to Mr. Edison by reason of the fact that they are licensees, or have been licensees, or have acquired the properties of licensees, under the Edison patents for the operation of central station light and power systems. This relationship brings into relief Mr. Edison's position as the founder of the industry in which they are engaged. It places the Member Companies in the much-prized position of being executors of his concept of public electrical service.

Edison's penetrating analysis in 1878 of the requirements for an electrical system providing light and power service to the public and his clear concept of a method of meeting these requirements displayed an acumen which might seem to us to have amounted almost to prescience or intuition, were it not for the many demonstrations he has given of his remarkable proclivity for clear thinking and straight reasoning. Before anyone else had thought of such a system, Edison, in 1878, contemplated the combination of a generating station, either steam or water power, and a distribution system. He dismissed as negligible, the potentialities of isolated plants. He visualized a service that would bring to the public not only light, but also heat and power. He proposed to light homes, run elevators, sewing machines, and other mechanical devices, and to cook food by current so supplied. Who but Edison, at that time, could have anticipated the great public electric service, so thoroughly the materialization of his ideas, which we now enjoy?

Through the years of the great growth of these Member Companies the name "EDISON," rightfully in the corporate titles of many of them, has been an inspiring symbol, the reputation of which they have cherished zealously. Now that fifty years of experience attest the soundness of Edison's early concept of a light and power service, it is an honor, on behalf of the Association of Edison Illuminating Companies, to be privileged to express the affectionate esteem in which Mr. Edison is held by the central station industry; to join in the general acclaim with which this year we hail the fiftieth anniversary of his development of a practical light and power system; and to extend its congratulations to one who will always remain, to the industry, the "Grand Old Man."

Edison and the American Institute of Electrical Engineers

By F. L. HUTCHINSON

Executive Manager

THOMAS A. EDISON'S characteristic, clear cut signature occupies a prominent place upon the original call issued in the spring of 1884 for the organization meeting of the American Institute of Electrical Engineers. This historic document occupies a conspicuous place in the members' room at the Institute's headquarters in New York. In the list of charter members of the Institute who were associated with Edison at this time may be found the following whose names are known throughout the electrical industry: Alexander Graham Bell, Charles F. Brush, Stephen D. Field, Norvin Green, George A. Hamilton, Edwin J. Houston, C. O. Mailloux, T. C. Martin, Frank L. Pope, Elihu Thomson, Theo N. Vail, and Edward Weston.

This document stated that "it seems probable that those persons who are interested in our electrical, scientific, educational, manufacturing, telegraphic, telephonic, and like concerns, as well as the users of electrical appliances generally, will find it to their advantage, personally and collectively, to establish, support, work for, and generally aid our proposed Society."

Edison was not only one of the organizers of the Institute, which represents the electrical engineering profession in the United States, but at the first election of officers on May 13, 1884, he was elected a vice-president.

Thus in the days when electricity was truly "in its infancy," Mr. Edison was actively interested in creating an organization, the objects of which are, as stated in its Constitution, "the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, and the maintenance of a high professional standing among its members."

Edison's work and achievements and their effects upon the electrical industry, and upon our present day civilization, are well known to all. His character and life work have constituted a great inspiration for workers in the fields of engineering and science, in recognition of which the Edison Medal was established in 1904 by an organization of associates and friends of Mr. Edison, "for the purpose of appropriately recounting and celebrating the achievements of a quarter of a century in the art of electric lighting with which the name of Thomas Alva Edison is imperishably indentified."

This group decided that the most effective means of accomplishing its object was by the establishment of a gold medal which should "during the centuries to come serve as an honorable incentive to scientists, engineers and artisans, to maintain by their works the high standard of accomplishment set by the illustrious man whose name and features shall live while human intelligence continues to inhabit the world."

The American Institute of Electrical Engineers was invited to undertake the responsibility of making the awards. The institute gladly accepted and, for this purpose, organized the Edison Medal Committee, consisting of 24 members.

The By-laws of the committee provide for making one award each year and the Deed of Gift, creating the medal, specifies that the award shall be made "to some one resident in the United States or Canada for meritorious achievement in electrical science, electrical engineering, or the electrical arts."

The first award was made to Dr. Elihu Thomson in 1909; followed by awards to: Frank J. Sprague, George Westinghouse, William Stanley, Charles F. Brush, Alexander Graham Bell, Nikola Tesla, John J. Carty, Benjamin G. Lamme, W. L. R. Emmet, Michael I. Pupin, Cummings C. Chesney, Robert A. Millikan, John W. Lieb, John W. Howell, Harris J. Ryan, William D. Coolidge, and Frank B. Jewett.

Recently the American Institute of Electrical Engineers has been privileged to give further recognition to Mr. Edison's services and achievements. The Constitution of the Institute provides that Honorary Members may be chosen, upon the unanimous vote of every member of the Board of Directors, from among those who have rendered acknowledged eminent service to electrical engineering. Prior to last year the very few distinguished scientists and engineers, thus elected were all from foreign countries. In June 1928 the Directors' decided to admit five outstanding American Engineers to this honor; the name at the head of this American group was Thomas Alva Edison.

Edison and the Illuminating Engineering Society

By A. B. ODAY

General Secretary

IT HAS been stated that Light's Golden Jubilee will be just as much an occasion for serious retrospect, profound appreciation and genuine inspiration as it will be a celebration. It will be a celebration exclusive to no one company, association, society or industry, nor will it be limited to any single nation. It is upon the people of the world, upon a grateful people, that the blessings of Edison's inventive genius have been showered.

It is with a spirit of "profound appreciation and genuine inspiration" that the Illuminating Engineering Society views the elaborate preparations being made to do honor to the man who is so largely responsible for the tremendous advancements in our present-day civilization, the man to whom we are forever indebted for most of the gifts of light and power which very largely make life what it is today. The Illuminating Engineering Society feels particularly indebted to Mr. Edison inasmuch as his invention of the first practical incandescent lamp paved the way for the present-day light source upon which practically all modern illuminating engineering practice is based. The art and science of illuminating engineering has been developed to a point where it now takes its place with other branches of engineering and plays a vitally important part in bringing to the millions of our population opportunities for a better, a broader, a more satisfying existence through the use of adequate artificial illumination for home, office, shop, industrial and transportation needs.

We celebrate this year the golden jubilee of electric light to honor Thomas Alva Edison who has devoted his life to labor in the service of mankind and who is now at the fiftieth milestone of his greatest achivement. The organization of the entire electrical industry in this magnificent tribute to its founder, the widespread interest and enthusiasm with which the people of many countries are organizing to do honor to "the Giver of the Light" is a source of pride and inspiration to all illuminating engineers and especially to the members of the Illuminating Engineering Society.

Edison and the National Electrical Manufacturers Association

By ALFRED E. WALLER

Managing Director

FROM those supreme virtues of mind and spirit which enabled Thomas Alva Edison to create a world change, the electrical manufacturing industry derives inspiration for public service. His was an outstanding gift to humanity. Born of indefatigable labor, enduring faith, scientific structure and infinite promise, the modest beginnings of our industry have grown to give mankind a new stature and a new horizon. With this has come courage and happiness—the true quality of Edison's achievement.

In carrying forward the thousands of torches lighted from the flame of this man's genius, the electrical manufacturers, both individually and collectively, appreciate the depth of their obligation to him and their responsibility, which is to preserve and develop his works for the benefit of posterity. Progress and service are obligatory.

In this era of prosperity, in company with a grateful world, liberated by electricity, we of the National Electrical Manufacturers' Association take this occasion of Light's Golden Jubilee to offer Mr. Edison our heartiest congratulations, our unbounded admiration and every good wish for his continued health and happiness.

The Electrical Leagues as Coordinating Units in Light's Golden Jubilee

By KENNETH A. McINTYRE

Managing Director, The Society for Electrical Development, Inc.

A GREAT measure of the success of Light's Golden Jubilee will be the degree to which the national plans are carried through locally.

In this latter connection it is fortunate that among the tools available to the industry in an undertaking of this kind are the more than 100 electrical leagues and clubs functioning throughout the United States and Canada. These organizations have been created primarily to promote market for electric service and supplies through cooperative means, and to participate for the industry in civic affairs. They are ready and anxious at all times to play their part in a movement such as Light's Golden Jubilee. Operating in territories with a total population of 33,325,000 the leagues generally report that they are scheduling this celebration as a major activity of the year.

The Society for Electrical Development as the national headquarters of this local industry movement functions in this connection by distributing information about the activity; fostering and promoting it from headquarters and through field contact.

The S. E. D. in turn maintains close relations with the National Committee and has not only distributed official bulletins and plan books to the leagues but has devoted a considerable part of its monthly publication during recent months to report developments of the activity. Another step in forwarding this undertaking was provided through inclusion of an address on Light's Golden Jubilee in the program of the recent League Conference attended by representatives of some 58 of the operating leagues of the United States and Canada. H Freeman Barnes was the speaker and dramatized most skilfully and effectively the plans worked out nationally to make this tribute to Mr. Edison one worthy of our great industry.

Many of the league managers present outlined their plans. Space does not permit giving these in detail but the extent to which the leagues are participating and the enthusiasm displayed may be judged from the following digested reports from representatives cities which give a cross-section of organized local activities.

Hudson-Mohawk and affiliated Electric Leagues (Albany, New York.) This organization has set up a general committee and each of the nine affiliated local organizations will have its own committee. School children will be given reprint of article on Thomas A Edison, and physics classes supplied with replicas of first lamp. There will be an essay contest in the Junior-Senior High School. Speakers will address luncheon clubs, Rotary, Kiwanis, Lions and other gatherings on "Edison, the Benefactor of Mankind." Activities will be tied in with local Chambers of Commerce. Special lighting arranged including golden lights for street lighting and colored lights for water falls, fountains and the like. Special articles including interesting anecdotes and stories of Mr. Edison's life and inventions will be prepared suitable for local newspapers and other mediums.

At a meeting of the Board of Directors of the Society for Electrical Development, Inc., held at Atlantic City, New Jersey, Tuesday, June 4, 1929, the following preamble and resolutions were unanimously adopted:

WHEREAS, this meeting occurs at the beginning of Light's Golden Jubilee, which celebrates the fiftieth anniversary of the practical development of the incandescent lamp, and

WHEREAS, we realize that participation in a great industry dedicated to the service of the public was made possible only by this great achievement, and

WHEREAS, this Jubilee affords an opportunity to pay special tribute to the man to whose genius are attributable the great blessings which have been showered on mankind through the agency of his invention, and

WHEREAS, it is realized that the birth of the incandescent lamp was the beacon light which more than any other one agency led us to our present stage of industry development, resulting in a greater stability of business and our present standards of comfort in living,

NOW, THEREFORE, BE IT RESOLVED that the Board of Directors of the Society for Electrical Development, Inc., speaking for its membership, which represents all groups in the electrical industry, desires to place on record its appreciation of the great debt we owe to Thomas Alva Edison, the master mind of the electrical industry,

AND BE IT FURTHER RESOLVED that a copy of this resolution be forwarded to Mr. Edison as an earnest, though inadequate, expression of our admiration and esteem.

For the Board of Directors,

W. W. FREEMAN,
President

CHARLES L. EDGAR,
Chairman, Executive Committee

Electrical League of Youngstown, (Ohio). The official Edison poster will be reproduced on double sided banner, 24 feet high by 20 feet wide and suspended over the public square. Radio and Electric Show will be held to tie in with the Jubilee. The manager of one of the local amusement parks will show some jubilee pieces as part of fire works display. Street lighting standards in public square will have special globes. All downtown street lighting will be provided with golden colored screens. The tower and two top stories of the new Central Bank Building will be permanently flood lighted in white. Educational talks will be given before the civic clubs and organizations. Efforts being made to have the larger stores and office buildings install applique lighting.

The Electrical League of Cleveland, (Ohio). Widespread activity has been organized and committees are working on the job. The cooperation of various local groups and associations has been obtained and arrangements made with city for installation of appropriate street lamps. Public buildings will be decorated and flood lighted and special tie-in will be made with automobile Chambers of Commerce in surrounding towns for parade to Edison's birthplace at Milan, Ohio. Special night aeroplane race and other features will make an outstanding celebration.

Electrical League of Rochester, (New York). Will flood light public fountain in conspicuous place and public and fraternal organization buildings and public gardens. Main thoroughfares will have amber tinted lighting globes. Illuminated signs will be displayed. Radio broadcasting programs will consist of music and talks on Edison and the service of light. Special addresses will be made before groups in churches, schools, colleges and clubs, and other character building institutions. Newspaper features will be carried up to and including October 21, and there will be daily advertisements in all local newspapers during the week

October 14 to 21. Displays in windows of buildings of the Power Company, Retail Merchants Council and lobby of Chamber of Commerce and decorative lighting in stores, theatres, hotels and large industrial plants. Edison display will occupy a booth at the Rochester Exposition.

Electric League of Indianapolis, (Indiana). The famous Soldiers and Sailors Monument in the center of the circle will be flood lighted, and lighting displays made on buildings around the circle. Street lighting will be one of the features. The Federal Building, University Square Park, the Indiana War Memorial, the new Scottish Rite Building and other famous edifices will have special illumination. The carillons in the Scottish Rite tower will play "The Star Spangled Banner" and other appropriate music. Special moving pictures of the life of Thomas A. Edison will be shown from the North Plaza of the War memorial.

St. Louis Electrical Board of Trade (Missouri). Large sponsoring committee appointed, headed by Mayor Miller and Louis A. Egan, President of the power company. The Electrical Board of Trade is co-operating with this committee in arranging for a big celebration.

Electrical League of New Orleans (Louisiana). Main point of celebration will be Lafayette Square Park in front of the City Hall. Exteriors of buildings surrounding the Park, public monuments and local institutions will have special illumination sponsored by Chamber of Commerce co-operating with league.

Electric Club of Houston (Texas). This organization is arranging for speakers at club luncheon during week of October 21. Owners of buildings are co-operating by leaving on all lights in buildings on that evening. Essay contest organized and extra feature will be a special radio program.

Manitoba Electric Association (Canada). League is co-operating with local organizations to participate through special lighting installations.

The Electric Club of Louisville, (Kentucky). One of the features of celebration will be entertaining the members of the American Legion which will hold its annual convention in Louisville. The first night of the convention will be dedicated to Mr. Edison. Ten thousand special lights will be used in festoons covering the principal streets of the city.

Cincinnati Electric Club, (Ohio). Aeroplane parade is being planned in conjunction with Aviation Corps. New building of power company will be feature of the celebration with special flood lighting. Electric show will be held to tie in with special exhibitions. The orchestra of Vincent Lopez, and other entertainers have been engaged. Window display contest is one of the units of comprehensive plans.

Electrical League of Milwaukee (Wisconsin). Rotary Club will sponsor local celebration. A Food Show during the week of October 21, and spectacular demonstration will be held in public auditorium. Local Radio Trade Association is tying-in. Downtown Business Men's Associations are arranging for special illumination and there will be a window display contest for merchants and an essay contest among the school children.

Electrical League of the Tri-Cities (Rock Island, Illinois). This League will furnish stores with lithographed posters of Edison and waterproof banners for street decoration. Local white ways will be changed in Rock Island, Moline, East Moline, Davenport and Bettendorf to golden paths of light. Chambers of Commerce are requesting merchants to decorate windows with golden tinted materials and lights. Special features include electric fountains, flood lighting the front of buildings and pageants of light on one of the local football fields are included.

Electric League of Erie (Pennsylvania). Street light globes will be changed to golden colored, supplemented with festoons. Public docks will have an aurora borealis and water fountains in public parks will be flood lighted. There will be moving pictures of Thomas A. Edison and the exteriors of the theatres decorated with fitting illumination. Hotels and office buildings will be flood lighted and decorated and merchants are making timely window displays depicting contrast of styles of 1879 and 1929. The Yacht Club contemplates a water pageant and the two air ports are considering demonstrations of flying with illuminated planes. There will also be special addresses at schools. Churches, luncheon and service clubs are holding special services and meetings.

Electrical League of Richmond (Virginia). Contemplates flood lighting of Battle Abbey, St. John's Church and the Robert E. Lee monument and other historical monuments and buildings. Stores will have special decorations and a pageant is being organized by the Community Recreation Bureau. Special electric signs with golden lamps and other lighting features will be employed. Special lectures and addresses will be given at Virginia Mechanics Institute. About one hundred and sixty (160) street lighting ornamental standards will be dressed up with silhouette effects showing the figures of 1879-1929.

Electrical Extension Bureau of Detroit (Michigan). Plans are being worked out through Board of Commerce with support of the Mayor. October 21 to be set aside as special day to pay tribute to Mr. Edison. Downtown celebration will be held, tying-in with exercises at Dearborn. Funds of approximately $25,000 being raised to install electrically lighted fountain in Grand Circus Park as gift to city. Library and Art Museum and other institutions will be flood lighted and streets will be turned into paths of gold by use of special globes. Special addresses at schools and newspapers considering sponsoring essay contest.

Electrical League of Colorado (Denver). Every line of business and industry joining in celebration to culminate in seven day observation preceding Edison Day October 21. Program of night sports in University Stadium including football game played under flood lights. Display of old and modern lighting in city auditorium. Talking movie of Edison and special program broadcast on Edison night. The spray of electric fountain dedicated to Light's Golden Jubilee will be used as background showing colored likeness of Edison. Three main business streets to be decorated with festive lighting. All public buildings will be illuminated and there will be a huge "Welcome" arch to greet visitors emerging from Union Station. Some of the trains will be designated as "Golden Jubilee Trains." Illuminated airplanes and sky lighting, Edison Day exercises at schools and special services at churches will be among features.

Electric and Radio Association of Kansas City (Missouri). Bronze tablet will be sunk in large boulder placed in public square near Union Station with suitable dedication ceremonies. Convention hall seating 10,000 people will be used to broadcast special program. Edison films will be shown. Special decorations for electric and radio expositions will tie-in with Edison pageant.

Metropolitan Electrical League, (Boston, Mass.). Boston Chamber of Commerce, Associated Industries of Massachustets and Power Company are tying-in with well-rounded program. All plans being worked out under general committee. Special illumination and other features included.

The Electric League of Washington, (District of Columbia). This organization will sponsor model electric home with spectacular lighting of grounds. Gold colored screens to be installed on principal residential street lamps and merchants requested to dedicate at least one window to Mr. Edison, supplemented by suitable interior decorations. Theatres approached to install special lighting and play suitable overtures and include prologues on Mr. Edison.

Electric League of Pittsburgh (Pennsylvania). Electrical interests with Power Company and league working out splendid program in co-operation with Chamber of Commerce. A number of committees already appointed, each of which is responsible for some phase of the local activity. All business firms, including department stores, food stores, as well as industrial plants are being tied-in.

The West Coast. Out on the west coast, the story is perhaps best recited by a detailed account from Victor Hartley, executive secretary of the California Electrical Bureau, which covers the state through 26 operating districts.

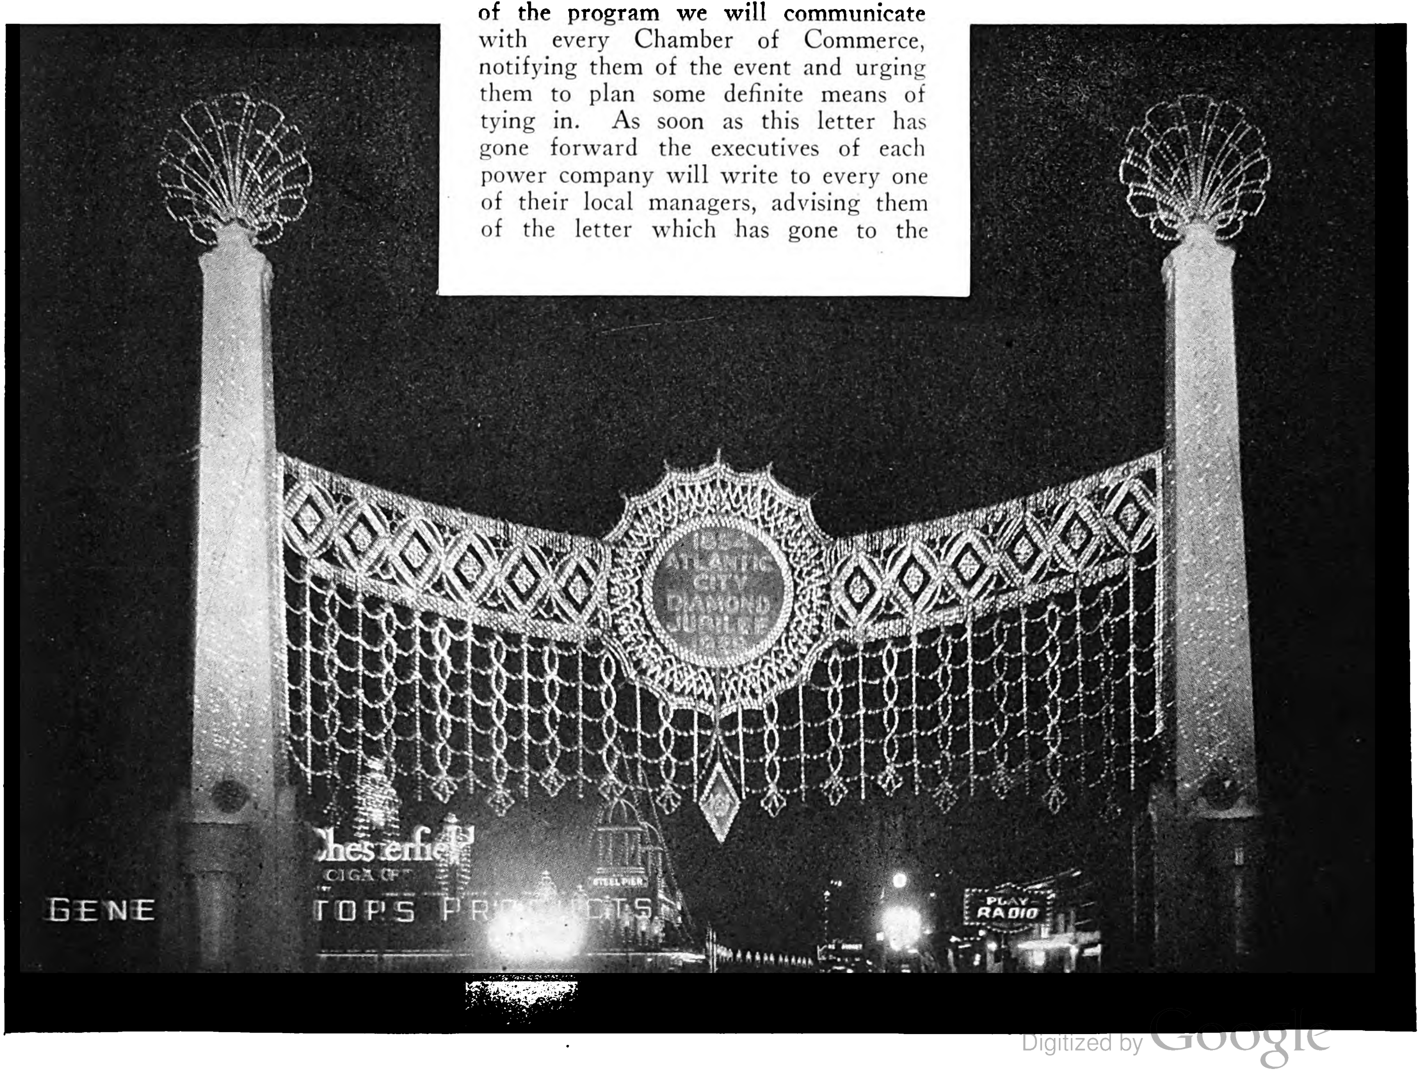
Mr. Hartley advises the society as follows:

"The program for promoting Light's Golden Jubilee lies in the hands of two committees, one under the Chairmanship of E. P. Markee, General Electric Company, Los Angeles, who will be responsible for the success of the program in Southern California; the other under the Chairmanship of Morris C. Hixson, Edison Lamp Works, San Francisco, responsible for the program in Northern California.

"With each of these committees the California Electrical Bureau will work very closely, acting as a clearing house for all information and publicity as well as aiding them financially. What the details are of the southern committee's plan I cannot say as I do not know that they have been definitely formulated as yet. Here in the north we have divided our program into two sections, Metropolitan program covering San Francisco, Oakland and Berkeley and a program for the outside territory covering the balance of the northern part of the state. Under this second part of the program we will communicate with every Chamber of Commerce, notifying them of the event and urging them to plan some definite means of tying in. As soon as this letter has gone forward the executives of each power company will write to every one of their local managers, advising them of the letter which has gone to the Chamber and instructing them to follow the matter through to see that prompt and effective action is taken in arranging a local program.

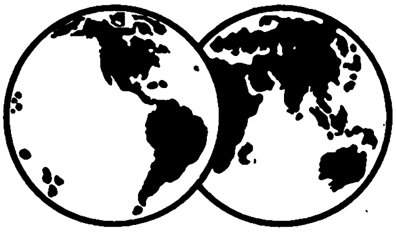
"In San Francisco and the East Bay we are endeavoring to have the activity sponsored by some such civic group as our Down Town Association. With their backing we will then proceed a program which will in itself bring Light's Golden Jubilee to the attention of the public as well as being productive of newspaper publicity. A proclamation from the Governor of the State will declare the week ending October 21 as Edison Week in order that all of the activities may culminate on that night. It is our plan in San Francisco and the East Bay to have Light's Golden Jubilee banners on the street cars, and we are planning a comprehensive program of talks at service clubs throughout the state which will consist of brief announcements of Light's Golden Jubilee throughout September and feature talks occupying the entire program of these clubs between October 1 and 21.

"We realize that in addition to these customary campaign methods we should have, at least in our Metropolitan program, some big feature or spectacle but what that is to be has not yet been determined."



Light's Golden Jubilee in Foreign Countries

By HOWELL H. REEVES



THE contributions to the growth of the electric light and power industry have been truly international. There is scarcely a country in the world that has not made distinguished gifts to electrical science. Faraday, Swan, Volta, Ampere, Siemens, Gramme, Jost, Hanaman, de Ferranti, Fujioka, Yoshima, Dawson are but a few among the illustrious names that will be ever remembered for their work in bringing light to the world.

There have already been held centenary, or other celebrations commemorative of the work of some of these, and in which celebrations America has been proud to join. Now the time has come when a wonderful tribute is being paid to a pioneer in the electrical field who is still living. By the accident of birth he happens to be an American. His forbears were Dutch and Scotch. His father was born in Canada. So it is that not only the people of the United States of America are proud to honor Mr. Edison, but many foreign countries as well have expressed the intention of honoring him in the celebration of Light's Golden Jubilee.

This is most fitting for Edison gave his lamp to the world, not to any restricted part of it. The benefits from his invention have been available to every nation impartially. All nations use electric light; and, as we know to be true of our own country, much of the universal progress in living comfort and industrial prosperity is largely due to its existence. Light may well be called the essence of civilization. Throughout the ages the peoples of the world have been fighting darkness. Mr. Edison, working on his problem, was laboring in the interests of mankind; he was exerting his genius, patience, and perseverance, not for the people of the State of New Jersey, not for the people of the United States, but for every human being, with the conviction that man was not meant to spend half his life in darkness.

A celebration carried on exclusively by the United States just because Edison happened to live and do his work within her boundaries would be unbalanced. No matter where Edison had been born he would have been challenging, striving, and—knowing the man as we do we can assume—succeeding.

On the occasion of Light's Golden Jubilee the peoples of the earth, irrespective of race, color, or nationality, who are grateful to Edison for his work are joining to pay tribute. And in so doing they are brought together by a high purpose. It requires a great incentive to unite such a variety of peoples in one great movement. When such an incentive exists it is of inestimable value in the promotion of goodwill and understanding among nations. Of great significance, therefore, is the international aspect of Light's Golden Jubilee.

The International Commission on Illumination has played an active part in stimulating interest all over the world in this celebration. It has been instrumental in organizing activities in many countries.

The plans of all countries are not known in detail at the time of going to press with this article, but the following summary will give some idea of the world-wide extent of Light's Golden Jubilee.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

ARGENTINA

The Sociedad Argentina de Luminicultura, an organization recently formed for the promotion of lighting, is planning a Light Festival to be carried out by the business organizations of Buenos Aires. While the plans are incomplete, one of the features will be in the nature of a window lighting campaign extending over a period of two weeks. It is planned also to secure the cooperation of government authorities and municipalities for the general illumination of buildings, including probably a waterfront lighting display. It is expected that at least certain of these features will occur during the two weeks' period including Oct. 21.

AUSTRIA

Austria is planning a Light Festival during the Autumn Exhibition from Sept. 2 to 8, and during the annual Congress of the German Association of Technical Illumination, Sept. 12 to 14, both of which will be held in Vienna. Every modern publicity method will be used to insure the success of Austria's celebration, including the radio, the press, and educational activities carried on through the schools. Addresses will be delivered by leading Austrian scientists who have been closely associated with the development of the incandescent lamp, and the public will be given an opportunity to observe machines formerly used in lamp production.

CANADA

In the Province of Quebec, the Sponsoring Committee for Light's Golden Jubilee is headed by Premier L. A. Taschereau as honorary chairman. The other members of the committee include many of the most prominent people in the Province. The Montreal Honorary Committee is headed by Mayor Camillien Houde.

The plans in the Province of Quebec include several broadcasting programs, the presentation of silver cups in several competitive undertakings besides many other appropriate activities. Among the features planned are floodlight displays for Montmorency Falls, the Parliament Buildings, and the fountains of the city of Quebec.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

CHILE

The Chilean delegate to the N. E. L. A. Convention was greatly interested and volunteered to cooperate with others in Chile in preparing a program. Details of the plans have not yet been made public.

CHINA

China will endeavor to make the commemorating date of Light's Golden Jubilee, Oct. 21, a special one in the history of Electric Light in China. Special advertising, special displays, posters, and moving pictures, will preceed the climax on Oct. 21, when an "Edison Day" party will be given the local Chinese electrical dealers and foreign officials.

FRANCE

While details are as yet incomplete, the Secretary of the French Committee on Light and Heat has written:

"We assure you that the French National Committee will join in celebrating this 50th Aniversary and in commemorating, in the month of October, Edison's important invention."

GERMANY

A letter from the President of the German National Committee of the International Lighting Commission contains the following:

"The Deutsche Beleuchtungstechnische Gesellschaft, which already in its telegram of June 30, 1929, to the Mayor of Atlantic City made reference to its participation in the American Jubilee festivities will also follow with the greatest interest the further course of Light's Golden Jubilee.

"An opportunity for practical participation will be offered at the meeting this year of the Deutsche Beleuchtungstechnische Gesellschaft in Vienna on Sept. 12 to 14, 1929. It has been arranged that in connection with this meeting the development of the flow lamp will be referred to, and honor will also be given to the pioneer work of Thomas Alva Edison."

HOLLAND

At the present time the cities of Amsterdam and Dordrecht are interesting themselves in the event. Details of the plans are incomplete.

ITALY

The Italian electrical industry has made excellent arrangements on an elaborate scale for celebrating Light's Golden Jubilee, and has requested copies of all printed matter, plan books and details of the program as developed in America.

Italy's honorary committee is headed by S. E. Giuseppe Belluzzo, Minister of Public Instruction and S. E. Alessandro Martelli, Minister of National Economy.

Associated with these two Cabinet Ministers on the honorary committee are presidents of thirteen national societies of the Sciences and Arts besides several members of the Nobility.

The Executive Committee is headed by Hon. Gv. Uff. Prof. Ing. Giacinto Motta, President of the Federazione Nacionale dei Gruppi Elettrici e della Unione Nazionale Fascista Industrie Elettriche, President of the A. N. S. I.

The Committees include all the most prominent names in Science and Industry in Italy and this is proof of the interest taken by that country in the celebration of Light's Golden Jubilee.

JAPAN

Already 250,000 Yen have been appropriated in Tokyo alone for activities to be carried out in that city and in adjacent territory. The committee in charge, under whose auspices the appropriation was made, consists of fifteen representative organizations including the leading engineering societies, the Japanese Broadcasting Society, the City Beautification Society, the Department Store Guild and a number of other groups. The program will include an exhibition on illumination, a demonstration of 50 kw. lamps, a model electrical home, banquet and gala celebration on Oct. 21 at the Imperial Hotel, public lectures by the Nation's prominent illuminating engineers at Tokyo Imperial University, essay contest on Light under the auspices of the Electric Society, and a Light Festival. High-intensity street lighting is to be installed on the principal business streets of the city, and Hibiya Park and the ground at Meiji Shrine will be similarly illuminated. At the Imperial Theater and Imperial Hotel Auditorium dances concerning electric light will be staged for the occasion. Moving pictures of Edison and his lamp will also be shown at leading moving picture theaters.

MEXICO

Conferences are being arranged in Mexico to formulate plans, and suggestions have been requested. The annual banquet of the Mexican Section, American Institute of Electrical Engineers, will probably be held on October 21, when the radio program broadcast from Dearborn, Mich., will be picked up on short-wave equipment and rebroadcast throughout the country.

PERU

We have heard that in Peru there will be special flood lighting, spectacular lighting, and window displays in connection with the celebration although the details of the program have not yet been received.

PORTO RICO

"We are planning a public celebration down here on Oct. 21 for Light's Golden Jubilee. The writer is on the committee and responsible for moving pictures and radio entertainment for that night. As long wave transmission is very independable down here, we are planning to receive over one of the short wave bands and with the aid of powerful amplifiers give a public entertainment of the proceedings at Dearborn."

The above is from a letter written by Mr. H. L. Talbot.

SWEDEN

In Sweden a special Golden Jubilee issue of the journal *Era* is being planned and arrangements are being made to feature motion pictures throughout the country dealing with the life of Edison and depicting progress and developments in lighting of a popular nature.

Mr. Edison's Protegé

WILBER HUSTON, sixteen-year-old Seattle, Wash., boy, the new protegé of Thomas A. Edison, is bearing his honors with a rare and becoming modesty.

Competing with 48 other youths, representing the states of the Union and the District of Columbia, who in turn had been selected through competitive examinations by the State Boards of Education as the most likely representatives of the several commonwealths, young Huston made the highest mark in the difficult elimination test prepared by Mr. Edison himself. The tests were held at the Edison laboratory in Orange, N. J., the first of August, the judges being Mr. Edison, Dr. Samuel W. Stratton, Henry Ford, Col. Charles A. Lindbergh, George Eastman and Dr. Lewis Perry.

Dr. Stratton's own school, the Massachusetts Institute of Technology, was selected by Wilber as the place where he will specialize for the next four years in chemical engineering, with all expenses paid by Mr. Edison.

The winner is the son of Bishop S. A. Huston of the Episcopal Diocese of Olympia. He was graduated from Lakeside High School last June. He is a slender boy, a little above average height for his age. Hornrimmed spectacles give him a bookish air, but his color and ebullience speaks of life in the open. Brown hair, hazel eyes, a slightly pointed nose, an easy smile. Newspaper reporters, trying to describe him, summed him up as "a good average American boy."

Wilber was revealed by the Edison questionnaire as one who would sacrifice comfort for success, but not honor, health, happiness, love, riches, nor reputation. He thinks "it is permissible to lie when it saves trouble, pain or grief, and you don't benefit in any way."

He has never been a boy scout or a member of the Y. M. C. A. He does not smoke. He was on the fencing team of his school, the small private Lakeside School in Seattle. His hobby is tramping along the shores of Puget Sound at low tide, collecting marine specimens for his dried collection. He intends to study chemical engineering in the Massachusetts Institute of Technology. He takes to science naturally as the grandson of Wilber Brotherton, plant-hybridizing expert.

He faced a barrage of cameras and questions with a pleasant self-assurance which might have been patterned after Lindbergh's. "Nothing doing," he would sometimes say; or, "I don't like to answer that question." Otherwise he spoke quickly, in few words, and kept his interviewers trying to think up new questions.

Before the award was announced a representative of the North American Newspaper Alliance approached all forty-nine boys and offered a substantial sum of money to the winner if he would write a piece for the newspaper. All but two agreed to do so. Huston was one of the two. After the announcement he still refused. He hesitated to write about himself. He thought a long time, puzzling about what was the right thing to do. Finally he wrote a piece. He refused to take any money for it.

By winning the contest, Huston automatically became President of the Forty-Niners, an organization of young men who will be interested to know what becomes of each other and whether the judges were right in their judgment of who was most likely to succeed to the scientific throne of Edison.

In the North American Newspaper Alliance article already referred to, the "brightest boy" said:

"When I was about ten years old I was given a chemical craft set and made my first experiments with it. My interest has grown ever since.

"In high school I did some experimenting in chemistry and electricity, and found a peculiar magnetic effect which I have never had explained to me. I hope to find out some time with further study what the phenomenon is.

"I took a general college preparatory course, but I'm afraid I never studied very hard. I saw a notice of the contest in the newspapers, but entered only when my grandfather urged me to. My grandfather, Wilber Brotherton, has been interested in hybridizing plants.

"My favorite sports (you can't compare your liking for sports and science) are tennis, fencing and swimming.

"I hope to go to the Massachusetts Institute of Technology, and some day be a chemical engineer. As to money, I want only enough to be independent.

"I never expected to win the scholarship contest. I am very happy to have won it and have the opportunity to go to a fine university and make contacts with men foremost in their fields. I'd like to correct an erroneous impression. There is no such thing as a successor to Mr. Edison. That would be impossible, and I am not so foolish as to think there could be.

"The examination given I thought fair, but I found all the questions tough and worked until the last ten minutes of my time.

"I wish more boys could have the same opportunity that I am going to have."

The Professional Motive in Public Utility Management

By DEANE W. MALOTT

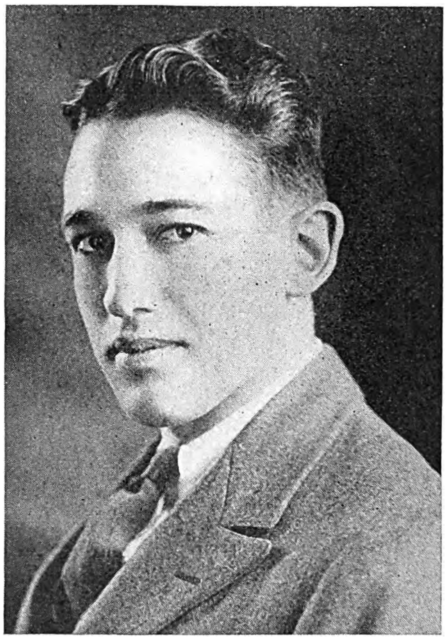
I ASK you to back away from the accounting and administrative problems with which your profession must abound—to retreat so far that the figures of your operating statements and balance sheets fade into oblivion—in order that we may take stock of the direction of your progress, and examine the far horizons toward which this great electric industry, in common with all American business, is heading.

The newspapers today are filled with criticisms and suspicions, and a certain amount of fear that the electric light and power companies have become a species of diabolical octopus which will get out of control and choke the very life of our nation. There are charges of corruption and propaganda, of enormous profits, inflated security prices, and selfish manipulations.

Yet I lay aside my evening paper to switch on the radio, bringing entertainment from distant cities. I note the convenience, the luxury of electric refrigeration, the electric cooker, washer, and ironer, which bring to my family the opportunity of a richer life—and all at a price which I must be willing to pay, or I would not have these conveniences. I am not forced to have them, for, with the exception of electric lighting, there are substitutes in direct competition for all these services.

FROM the telephone at my elbow I can reach any one of millions of individuals, for I am told something like 80 per cent of the entire world's telephones are at my immediate service. I ride through the country late at night and see the twinkling windows of isolated farmhouses, where inside are the comforts of electric lights and other domestic appliances, where the families are served by electric motors for pumping water and doing a dozen other tasks which provide the farmer with greater comforts and easier living. There must be something peculiarly dynamic in these utility industries, something of lasting worth which gives prophecy of even greater service in years to come. Somewhere in the industry constructive imagination of a high order has been at work.

I do not say that there has not been corruption, unhealthy propaganda, and shortsighted self-interest. Undoubtedly there has been, for I have observed that these elements are an inseparable part of every rapidly growing and prosperous industry. But it seems unlikely that an industry of such size could have arisen with these as the dominating motives. Largely, the development of public utilities has been through the corporation, a type of organization which, contrary to popular conception, inevitably tends toward higher ethical standards, with more of a feeling of trusteeship for the public which it serves, as well as for the employee and the security holder. The big corporation stands for stability and permanence rather than for rapid and immediate profits. It is easy for one man in a little shop around the corner to engage in sharp practices. It is far different in a corporation where the individual executive is surrounded by associates whose respect and trust are necessary to his existence. For these corporations are no longer controlled by a few men, nor by bankers. The ownership shares are scattered throughout the land, just like automobiles or electric lights.



Mr. Malott is Assistant Dean of the Harvard School of Business Administration. This address was made before the Fifty-second Convention of the National Electric Light Association, held at Atlantic City, N. J., June 3-7, 1929

In spite of this, considerable uncertainty seems to exist as to the motives of this industry. A part of the uncertainty is the result of a mistaken idea, prevalent both in and outside of the field, that there is essential antagonism between the public on the one hand and the utility operators on the other. A wall has been reared between the two, over which the two sides are making faces at each other. This feeling has tended to aggravate itself in the attempt occasionally made by the utilities to extort a monopoly profit by charging a high unit price for their services. Enlightened economic study, however, has shown that the ideal should be not a high price with resulting high unit profit, which restricts the business, but a low unit profit which will result in a high aggregate profit. Your business is subject to two definite economic laws. One is the law of diminishing costs; the other, of elasticity. The first indicates that unit cost decreases as volume increases. The second indicates that volume increases with a decrease in unit prices. Sound practice, therefore, calls for abandonment of the attempt to collect a monopoly profit which results in a high unit price on a restricted output, because your aggregate profit will be greater if your prices are cut to the limit. You may have seen instances within your own experience of this sort—where price reductions have led to increased consumption and increased profits—but the courage to follow this policy has been all too rare. The Hartford Electric Light Company has recognized these facts with notable success. And, after all, there is nothing in the world more obstinate than a fact.

WITH these economic concepts clearly understood, the barrier wall between utilities and the public largely disappears, and what is good for one is also good for the other. If the utilities' profits result from decreasing price, it is inevitable that the public, as well, receives a profit through the revision.

Europeans tell us that Americans are materialistic, money-mad, ruthless. Hence we have developed sordid tendencies toward the aggregation of wealth which have precluded any finer sensitiveness, and our foreign critics say as a result we have developed no great artists. But are the great business leaders so far removed from the great artists? The artist is one who visualizes the unseen, then through his ability turns vision into reality—on canvas, the printed page, in marble, or in music. Great business men likewise bring dreams to reality. James J. Hill, as a boy sitting on a packing case on the muddy banks of the Missouri River, dreamed of a great Northwest, and he made his dream come true. Theodore N. Vail dreamed of a universal telephone service, and the dream which he projected is reaching fulfillment. Are not these the qualities of the artist—to see things which no one has ever seen before, and then, with rare force and vitality, to convert the vision into reality? Undoubtedly these business leaders—and you have them within your own industry—have the same powers as the artist, though they apply them to a more obstinate material.

BUT, you say, these business leaders have now "arrived"; they have succeeded. Why worry about them at all, for life can hold for them no more. No, that cannot be, for evolution is our supreme law. We live in a dynamic, not a static world; there must be continual change. A professional motive must be found, is being found, I think, to carry these leaders onward. No victorious army ever went into camp, with never another campaign to fight, that it did not at once being to disintegrate. Under these conditions, leadership is impossible.

American business today is at the crossroads. We have mastered the technique of it, developed mass production and mass distribution beyond the point where they have ever been developed in the history of mankind. The development of business with a material aim—the aim of mere size and for a mere profit—cannot go much further. And when the aim of business becomes merely to hold on to what we have, the end is in sight. In the early stages of individual leadership there comes the desire for individual wealth. It is easily satisfied, and a surfeit of money does not bring satisfaction. In Dodsworth, Sinclair Lewis' recent book, this is portrayed forcibly—almost tragically. Then comes the desire to build up a big business, to dominate through sheer size, and still there is no lasting satisfaction. There must come forth, not a materialistic aim, for that has been attained, but a new, an ideal aim, to serve as the objective of progress.

Already we are beginning here and there to see some signs of it. Let me quote from the Annual Report for 1927 of the American Telephone and Telegraph Company, a company which has certainly reached nearly the zenith of materialistic progress and which dominates the field in its own industry. This report says:

"The American Telephone and Telegraph Company accepts its responsibility for a nation-wide service as a public trust. Its duty is to provide the American public with adequate, dependable, and satisfactory telephone service at a reasonable cost.

"Earnings must, of course, be sufficient to permit the best possible telephone service at all times and to provide a reasonable payment to stockholders, with an adequate margin to insure financial safety. Earnings in excess of these requirements will either be spent for the enlargement and improvement of the service furnished, or the rates charged for the service reduced. This is fundamental in the policy of the management."

Men everywhere who are in positions of leadership have come to make their ideal greater than themselves. It is a question with them of what is right, what will contribute most to the permanent welfare of the community. There are exceptions, of course, but if you look at the truly great leaders you will find their goal has absorbed even their interest in themselves. Thomas Edison long ago forgot himself in the pioneering efforts which absorbed his life. With perhaps unattainable ideals of what may be done, Mr. Edison keeps on.

CERTAINLY this is the beginning of a publicly announced ideal aim which will continue the telephone industry's development and prevent a "victorious army" from going into camp.

With this sort of attitude there will develop in this country a body of business men held together by a professional *esprit de corps*. This professional motive is not new—it has dominated many of the older professions for centuries. In the early ages we find it fiercely alive in the religious leaders — Francis of Assisi, Loyola, St. Dominic. There was a considerable measure of it in the early military leaders, such as Charlemagne and Frederick the Great. The old time conquerors were nearly all constructive statesmen. It is new only in application to business which has developed from a means of livelihood to stand for service to the community.

Among men who have vigorous, adventurous lives we have always found a strong tradition, an idealism, which has carried them to their objectives with irresistible force. The men who have followed the sea have been held together by strength of tradition, by an idealism which makes the captain the acknowledged leader. He holds his place by respect rather than force. The great men who followed the sea built up the tradition, which, in turn, served to bolster up the weaker men—a phenomenon no less true in the business world.

In the novels of Joseph Conrad we see the domination of the captain's honor —more important to him by far than his life. In the story called Typhoon we see the traditional professional motive, which never presents alternatives, but drives straight for its objective.

Captain MacWhirr, in appearance an insignificant little runt, is on the deck with Jukes, his mate, in a storm at night which shakes the crazy old steamer from stem to stern. As Conrad tells it: "While Jukes was exchanging explanatory yells with his Captain, a sudden lowering of the darkness came upon the night, falling before their vision like something palpable. It was as if the masked lights of the world had been turned down. Jukes was uncritically glad to have his Captain at hand. It relieved him, as though that man had, by simply coming on deck, taken most of the gale's weight upon his shoulders. Such is the prestige, the privilege and the burden of command.

"Captain MacWhirr could expect no comfort of that sort from anyone on earth—such is the loneliness of command."

Later on and the ship "was being looted with a senseless, destructive fury; trysails torn out from the extra gaskets, double-lashed awnings blown away, bridge swept clean, weather-cloths burst, rails twisted, light-screens smashed — and two of the boats had gone already. They had gone, unheard and unseen, melting, as it were, in the shock and smother of the wave. It was only later, when, upon the white flash of another high sea hurling itself amidships, Jukes had a rapid vision of two pairs of davits leaping black and empty out of the solid blackness, with one overhauled fall flying and an iron-bound block threshing in the wind, that he became aware of what had happened within about three yards of his back.

"He poked his head forward, groping for the ear of his commander. His lips touched it—big, fleshy, very wet. He cried in an agitated tone: 'The boats are going now, sir.'

"And again he heard that voice, distinct and faint, forced and ringing feebly, but with a penetrating effect of quietness in the enormous discord of noises, as if sent out from some remote spot of peace beyond the black wastes of the gale; again he heard a man's voice —the frail and indomitable sound that can be made to carry an infinity of thought, resolution, and purpose, that shall be pronouncing confident words on the last day, when heavens fall and justice is done—and it was crying to him as if from very, very far: 'All right.'"

BEHIND those two words was the leader of men, impregnable in his duty, apart from the ego-centric fears which break the weaker men, MacWhirr sees his duty so clearly bound up in the tradition of the sea—and no danger of the physical universe can daunt him.

But, you say, that is not real, that is only a blind tradition, the sporting instinct. It may be a blind faith, a creed, but there are parallels. The doctor with his professional ideals, the business man urged far beyond the point of perishable financial success, keeps on. Mr. Ford started as a tinker. He made a car which became successful, dominated the market, and he became tremendously wealthy. Did he stop? No, because his ideal was unattainable, infinite. He visioned a cheap and a respectable car within the reach of everyone. That dominating motive drives him on.

Men everywhere who are in positions of leadership have come to make their ideal greater than themselves. It is a question with them of what is right, what will contribute most to the permanent welfare of the community. There are exceptions, of course, but if you look at the truly great leaders you will find their goal has absorbed even their interest in themselves. Thomas Edison long ago forgot himself in the pioneering efforts which absorbed his life. With perhaps unattainable ideals of what may be done, Mr. Edison keeps on.

Great problems confront these leaders and press for solution on every hand. An individual may want to contribute the maximum service, to do what is right, but the decision calls for rare judgment. Owen D. Young, in discussing the golden rule in business, says: "When you discuss what is right in business, the difficulty lies not in determining what is right in principle. It is rather in the application of the principles to the vast, complex problems of our modern business. If you ask me with reference to business what is right in principle, I answer that the golden rule supplies all that a man of business needs. Yet, if you ask me to apply the golden rule to bank rates, I find it amazingly difficult to do. It is like telling me to apply the multiplication table to the design and manufacture of a steam turbine. I know that principles of mathematics underlie the building of that great machine, but it is a highly difficult problem to step from the multiplication table to the steam turbine.

"What is right in business requires, in highly complicated situations, that the golden rule be applied by men of great understanding and knowledge, as well as conscience."

And along with the trusteeship for business itself, our leaders are faced with a great social responsibility. In the midst of materialistic surroundings such as the world has never known, clear-sighted vision and tremendous effort is required, if we are to avoid becoming so highly geared in our physical activities that we lose our sense of poise, our sense of spiritual values. Business leadership must very nearly assume responsibility for our civilization itself if our upward evolution is to continue. Loss of these values, of a necessary perspective, has caused civilizations in the past to disappear. Who will assume the responsibilities of leadership, so greatly needed to maintain the balance? When we look to our ministers, our standard-bearers through the centuries, we find them top-heavy with dogma, the issues often obscured, with a resulting loss of faith on the part of men and women everywhere. The lawyer, formerly the leading citizen, has devoted his abilities so largely to business interests that he is often no longer the leader of affairs—a position which he occupied back in the days of the village squire. The doctor is involved with the great problems of physical ills; the teacher is too often a lonely man, in an airtight compartment, who fails to get a universal picture of the world's problems.

WHO is left? Only a large group of business men, run-of-the-mine and unimaginative, with here and there a great leader. So often the business man has not been urged by professional motives. Self-interest has been his only aim; and he leads his life, busy as a toad under a harrow, agile, but unwitting and ineffective.

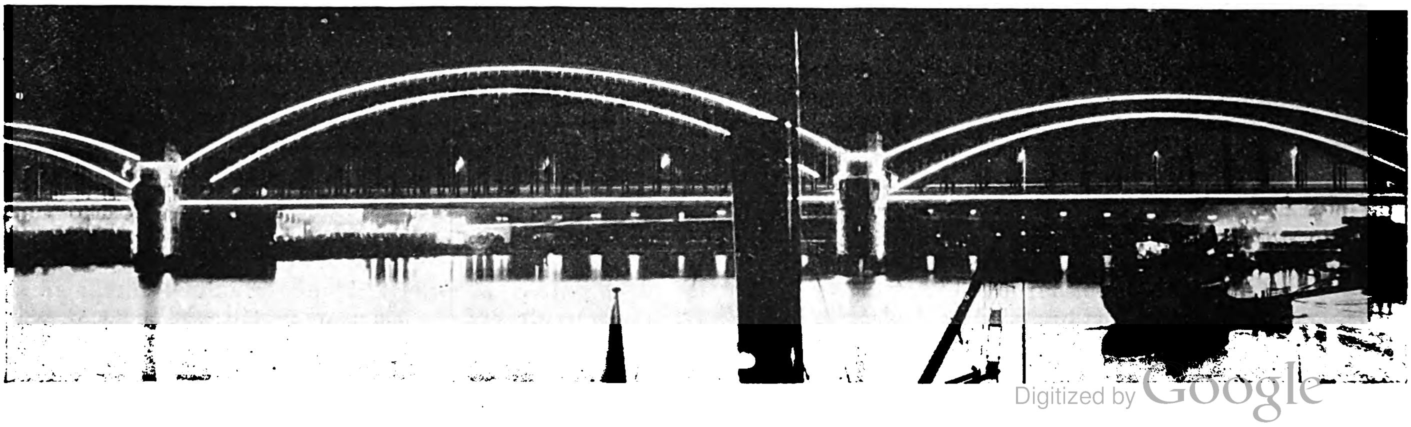
Not all men, indeed, are fitted for this new leadership. Some never get into the ephemeral realm of values, which cannot be measured any more than one can define a beautiful sunset, or a human emotion. One man would drive the horses of the sun. Another is happy driving a push cart. I have heard of a Harvard graduate who tried many occupations without success, and who finally found happiness as a street car conductor. Some think they have found their ideal, when they are merely chasing butterflies.

The very intangibleness of leadership and the professional motives which dominate it keep many from entering its realm. To him who does, however, that same intangibleness gives a thrust to his activity, which drives over mere tangible obstructions; for the professional motive is dominated by an almost mystical faith, where the end of the road is hidden; yet progress is the compass by which the journey is known and charted.

The professional motive is something bigger than the individual who possesses it, something outside of him, which takes possession of him, absorbs him in its inspiration. He acts freely, not under compulsion as a slave or a man with a vicious habit. He willingly and gladly stakes his property and his comfort. It caused a brilliant medical man to spend his life among the Kentucky mountaineers in comparative poverty; it caused a business man to give up a splendid position to become a college administrator; it caused a man like Munsey at the end of life to give his millions to art; and it has caused many a man so to devote himself to his business, so to apply his energies, as to fulfill his dream of a business of maximum service to the community. The sporting element is always present. The professional motive does not calculate, does not weigh chances and risks like a bookmaker at a race or a cock fight. The professional man plants his feet upon a law of the universe, a great ideal, and defies chance, accident and fate.

Charles W. Eliot, one of America's keenest observers of human nature, once wrote: "The gypsy in Asia Minor makes iron nails one at a time with hammer on an anvil, much as his ancestors did before him for hundreds of years. I have seen him doing it; but I also observed that his small children were stark naked and that his larger ones had only one garment. . . . In industry and commerce all things are become new."

The one tradition therefore which we should hold inviolable, is the tradition of constant change. It will inevitably lead in the great industry which you represent, to the adoption of a professional motive on the part of your leaders—a motive which will still further develop your service, and aid in raising the level of our nation.



Behind the Veil

Civilization, Light and the Electric Arc

By ERNEST GREENWOOD

The sixth of a series of articles portraying against a social historic background, the evolution of the electric industry and the chief personalities that have been instrumental in its growth.

THE whole history of civilization has been characterized by the desire of man for more and more light. Ages ago evil spirits became associated with darkness and light became sacred. It has always been a symbol in the religions of the world and nowhere is it better typified than in that ancient Persian faith—Zoroastrianism. The religion of Zoroaster is sometimes called fire worship, but the descendants of the faith—the Parsees—claim that this is erroneous. It sprang up somewhere in the neighborhood of the Caspian Sea and there are still Parsees, or Ghebers, who do reverence to the "eternal flame" at Baku. The Modern Zoroasterians look upon fire as a symbol, or manifestation, of "divine power, purity and essence."

According to this religion, which basically is not so very different from any other religion, the universe was visualized as a great battleground on which Good and Evil were forever struggling for mastery. On the one side was Ahura Mazda—whose name has been made immortal by the Mazda Lamp—the Wise Spirit. His six vassals were: Good Thought, Right Law, Noble Government, Holy Character, Health and Immortality. On the other side was Angra Mainyu, the Lie Demon. Man stood between the two. On the one side was Good, Purity and Light, and on the other Evil, Filth and Darkness. Not a bad creed even when measured by the standards of present day Christian "enlightenment."

Ahura Mazda was the God of Light and was considered as the essence of civilization; in his service there could be no compromise. Zoroaster denounced all the old gods, but claimed that fire was not a god: that it was only a symbol of Ahura Mazda. He erected fire altars, but only as a testimonial to the Wise Spirit.

No one knows where or exactly when man's so-called "civilization" started. It may have been in Babylonia. We do know that somewhere about 4,000 B. C. the cave man's pine torch was succeeded by the hanging fire basket and that—again, perhaps—the burning of fat from roasting animals led to the invention of the oil lamp. The first oil lamp known to history was a crude affair, shaped like a clam shell, open at the top with a narrow place to hold a moss wick. An example of this lamp is now in the Museum of Lighting of the Pacific Gas and Electric Company. Six thousand years ago, Arthur L. Adkins tells us, colored saucer oil lamps were buried in the Pyramids with Egyptian kings to light their way into heaven.

In both Greece and Rome the fire cults of Hestia or Vesta and of Vulcan were a marked feature of religion. In ancient Rome the "Regia" was the sacred center supposed to be the abode of Vesta. If, by any chance, the sacred fire should be extinguished, all business and, in fact, all activities of every kind, stopped. It was thought that the connection between heaven and earth had been broken. During the annual festival of Diana (Vesta) her grove, so Sir J. G. Fraser in the Golden Bough tells us, "shone with a multitude of torches, whose ruddy glow was reflected in the lake; and throughout the breadth and length of Italy the day was kept with holy rites at every domestic hearth . . . someone unknown dedicated a perpetually burning lamp in a little shrine at Nemi for the safety of the Emperor Claudius and his family. The terra cotta lamps which have been discovered in the grove may perhaps have served a like purpose for more humble persons. If so, the analogy of the custom to the Catholic practice of dedicating holy candles in churches, would be obvious."

If we trace our modern religions back we find this same element of fire or light as the symbol of some divine being. With the flight of the Hebrews out of Egypt under the leadership of Moses came the beginnings of the Hebrew religion and with it the foundation of all modern religion for, after all, Jesus, the founder of Christianity, was a Jew. Moses must have been a man of considerable genius and one who thoroughly understood the psychology of a primitive people. He, and his followers with him, believed in one, everliving, personal God to whom they gave the name of Yahveh—or, as we mispronounce it, Jehovah.

In the desert was a volcano known as Sinai, or Horeb, which had been worshipped from time immemorial by a tribe called Kenites. Moses apparently understood that in addition to a fixed belief in a personal God it would be necessary to provide his people with a symbol which they could understand—something familiar to them in their everyday lives. So he led them to the foot of this holy mountain which, no doubt, served well as an altar in the early days of Hebrew worship.

SIR HUMPHRY DAVY

Skipping a few thousand years—and this any historian has a right to do—we find that in the Classical Age about 450 B. C. (150 years after Thales first puzzled over the problem of the electrical attraction of amber) the wealthy class had saucer oil lamps made of bronze instead of clay. Some of these lamps were set upon a two section standard which could be raised and lowered. They were not at all unlike the bridge lamp of today. These lamps were decorated with human, animal, and floral forms. Coming to a later date, I can do no better than quote John W. Lieb, senior vice-president of the New York Edison Company, in an address before the Illuminating Engineering Society in 1916. He said:

> "We are struck by the fact that there is a substantial historical basis for the view that the characteristic phrase, the Dark Ages, used to designate an epoch in history, indicates not merely a period during which the steady advance in civilization of the human race was temporarily checked, but literally also an age of gloom, for the luxury and brilliancy of Greece and Imperial Rome, bringing with it evidences of a desire for adequate illumination, was followed in the so-called Dark Ages by a retrogression to crude and ineffective means for supplying artificial light.
>
> "The Renaissance, with the gorgeousness and sumptuousness of its regal and ducal courts, brought with it also an increased demand for more light, confined largely, at first, to display at brilliant festivals and princely celebrations. About this time the candle first made its appearance, and by its flickering gleams and clustered groupings added mystery and pomp to religious and state ceremonials.
>
> "We have ample evidence in the works of that master mind and extraordinary genius, Leonardo da Vinci, of the attention that was being paid during this time to the providing of bizarre illuminating effects for gorgeous pageants and in the improvement for general interior illumination of the crude lamps, by the addition of chimneys, reflectors and even bull's-eye lenses. In the centuries immediately following, important advances were made in the application of improved burners for oil lamps using animal and vegetable oils, in which connection we recall the familiar names of Argand, Carcel and Hinks. Improved means of feeding the oil to the wick appeared in various forms of pump and clock lamps, of which the moderateur type survives in the still popular so-called student lamp.
>
> "In the early part of the last century, notable progress was made in the field of lighting by oil lamps, due to the impetus given by the discovery of mineral oil, first used as an illuminant in 1853, and giving rise in later years to steady, efficient and powerful oil lamps. The candle industry had also in the meantime been making progress, resulting in the displacement of the old tallow dip and wax candles with the improved stearic acid and parraffine candles, which are still popular for special uses and which have given us our unit value of illuminating effect, the parliamentary standard candle."

In 1400 A. D. Venice and Florence awoke from the Dark Ages and began to encourage art, although science was still suppressed. The Venetian oil lamps did not give any better light than did the lamps of Homer's time and, strangely enough, some of these Venetian lamps are still in use in southern European homes. About 1600 the Betty Lamp (Betty is a corruption of the German word "besser") was brought to America from England and became the everyday Colonial lamp. It had a covered oil pan similar to the saucer lamps of pagan Rome. It was not until 1783 that Argand, a chemist who had invented an oil burner which produced a hollow cylindrical flame, placed a chimney made of a broken bottle around it steadying the flame and causing it to cease smoking. This was the first real contribution to better artificial light in six thousand years.

EARLY in the 17th century—about 1609—artificial gas (what we call manufactured gas as distinguished from natural gas) was discovered by John Baptist van Helmont, a Dutch chemist. Previously he had devoted his researches to alchemy and was among the last of that long line of philosophers who sought to make gold out of baser metals. He turned to chemistry and accidentally discovered artificial gas, which he claimed had been up to that time unknown, was not susceptible of being confined to vessels, nor capable of being produced in a visible body.

Because of the superstitions which surrounded it, progress in the development of gas was slow, and it was not until late in the 18th century that William Murdock, by distilling coal in an iron retort and conducting the gas through tinned and copper tubes, succeeded in lighting his home at Redruth in Cornwall in 1792. In 1798 he built an apparatus on a large scale and lighted the factory of Boulton, Watt and Company, builders of steam engines, with gas. In April, 1802, on the occasion of the celebration of the peace of Amiens—the signing of a treaty by Great Britain with France, Spain and Holland—a public display of the new light was made.

On July 1, 1804, Albert Winsor, a German who obtained the first English patents for gas making purposes, gave an exhibition of gas lighting in the Lyceum Theater, London. The following description which appeared in the *London Times* of July 2 is interesting:

> "Sir Joseph Banks, ever indefatigable in promoting useful discoverings, went last Thursday evening, for the second time, with a large party of his noble and scientific friends to the Lyceum to witness the incredible effects of smoke; the whole theatre was lighted with the same, in a novel and pleasing manner; the arch of lights above the stage had a very striking effect, and from the English grate on the stage (which may be fixed in every room) issued a very brilliant and fanciful light. The products of tar, ammonia and coke were produced and much approved of. Several experiments were made during the course of the lecture, such as boiling a tea kettle and melting ores in a few minutes on a table. It was also proved that a brilliant flame adapted to light houses could be formed, which no rain or storm could extinguish. The noble and learned visitors, after a minute examination of the apparatus, stoves and products, expressed the liveliest satisfaction."

IT was not until 1812, however, that Winsor succeeded in getting a charter from Parliament for his company, the Westminister Gas Light & Coke Company, although in 1807 he obtained financial backing and gave a public exhibition of street lighting. His claims had excited much opposition and he was the object of considerable ridicule. Sir Walter Scott wrote a friend saying: "There is a madman proposing to light London with—what do you think? Why, with smoke." Napoleon, when he heard of the plan, dismissed the idea as *"une grand folie."* Actors in music halls poked fun at him while humorous writers continuously burlesqued him. Nevertheless, he succeeded in establishing the first gas lighting company in the world. The lighting of the streets of London was followed by Baltimore in 1816 and Paris in 1820.

It may seem strange in this day and age that street lighting in America was met, for years, with the most strenuous opposition. It was blocked in Philadelphia until 1836. In New England the proposal to light the streets with gas aroused a storm of protest. Some of the arguments against it, printed in a New England newspaper, which represented the best and most serious thought of the times, were:

1. A theological objection. Artificial illumination is an attempt to interfere with the divine plan of the world which had pre-ordained that it should be dark during the night time.
2. A medical objection. Emanations of illuminating gas are injurious. Lighted streets will incline people to remain late out-of-doors, thus leading to increase of ailments by cold.
3. A moral objection. The fear of darkness will vanish, and drunkeness and depravity increase.
4. Police objection. Horses will be frightened and thieves emboldened.
5. Objections from the people. If streets are illuminated every night such constant illumination will rob festive occasions of their charm.

But even before William Murdock or Albert Winsor were demonstrating the practicability of artificial gas for street lighting, another man — Sir Humphrey Davy, an imminent English chemical philosopher—was conducting a series of experiments destined to eventually eliminate for all time gas as an illuminant, and yet curiously enough dependent on the fact that gas can be made tremendously luminous by an electric spark. His first lecture before the English Royal Society, in which he begins to trace the history of galvanism and describing the different methods of accumulating it, was delivered on April 25, 1801.

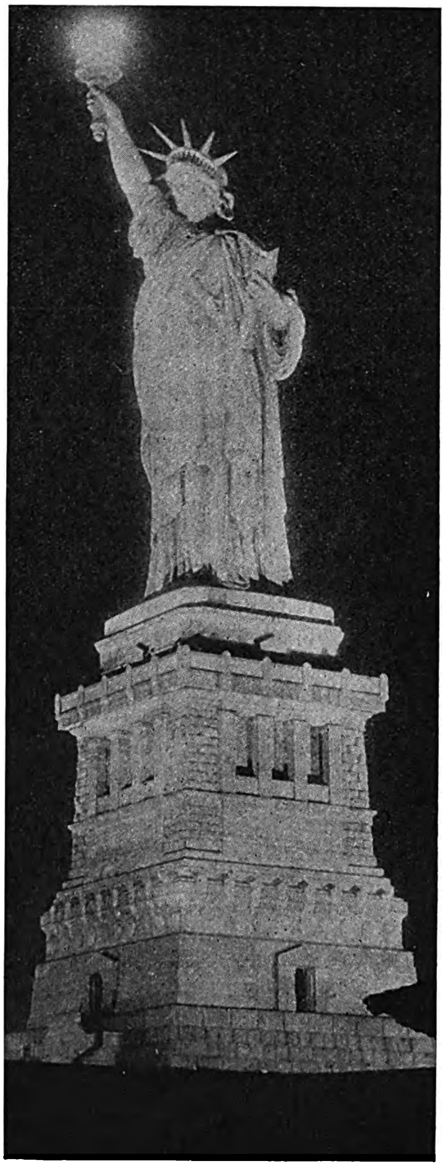
IT has been frequently stated that Davy made his first public display of the electric arc by means of a giant 500 plate galvanic battery in 1813. According to John Davy, in his "Memoirs of the Life of Sir Humphry Davy," this occurred in 1809 or 1810. However, at least ten years before this he had produced an electric "arc," and there were also others who, in the course of electrical experiments, had noticed it. In the *Journal of Paris,* under date of March 12, 1802, will be found the following interesting description:

> "Citizen (E. G.) Robertson, the inventor of the phantasmorgoria (magic lantern) is at present performing some interesting experiments that must doubtless advance our knowledge concerning galvanism. He has just mounted metallic piles to the number of 2500 zinc plates and as many of rosette copper. We shall forthwith speak of his results, as well as of a new experiment that he performed yesterday with two glowing carbons. The first having been placed at the base of a column of 120 zinc and silver elements, and the second communicating with the apex of the pile, they gave at the moment they were united a brilliant spark of an extreme whitness that was seen by the entire society. Citizen Robertson will repeat the experiment on the 25th."

In a memoir by Dr. H. Moyes, of Edinburgh, published in the *Philosophical Magazine* under date of February 1, 1801, will be found the following paragraph: "When the column in question (undoubtedly the carbon column) had reached the height of its power, its sparks were seen by daylight, even when they were made to jump with a piece of carbon held in the hand." In the same volume of this magazine will be found an account of similar investigations made in Germany by Dr. Frulander of Berlin. Davy himself in the *Journal of the Royal Institution,* 1802, describes a few experiments, saying: "When instead of metal, pieces of well calcined carbon were employed, the spark was still larger and of a clear white."

But, according to Mottelay, all of these observations are subsequent to a letter printed in *Nicholson's Journal* for October, 1800, page 150, entitled "Additional Experiments on Galvanic Electricity in a Letter to Mr. Nicholson." The letter is dated Dowry Square, Hotwells, September 22, 1800, and is signed by Humphrey Davy, who at that time was assistant to a Dr. Beddoes of the Philosophical Institution of Bristol. This letter starts out: "Sir—The first experimenters in animal electricity remarked the property that well calcined carbon has of conducting ordinary galvanic action. I have found that this substance possesses the same properties as metallic bodies for the production of the spark when it is used for establishing a communication between the extremities of Signor Volta's pile." So we are forced to conclude that Sir Humphrey knew of the electric arc as early as 1800 and that quite possibly others knew of it even before that time.

Before delving into the history of the arc light which was the forerunner, or ancestor, if you please, of modern electric lighting, it might be well to investigate as to what an arc light really is and whether or not it has the slightest relation to gas lighting. Most folks seem to think that the great brilliancy of the old-fashioned arc light is due to an electric spark passing between the two ends of sticks of carbon. If this were true, then the arc light would have become an instant success as soon as a method of generating current which could be distributed was devised. What Sir Humphrey and various other experimenters did not realize is that the light of the arc is derived either from a vapor column or from a body heated to incandescence by a vapor column.



IN the production of the arc light two rods of gas carbon are brought together momentarily and then separated about one-fourth of an inch. The resistance at the point of contact is so great that some of the carbon is vaporized by the heat produced. This carbon vapor serves as a conductor and forms the arc; the light produced is very intense. It is nothing more or less than an incandescent vapor bridge. In the beginning this was not recognized and, of course, no effort was made to utilize the luminosity of this "vapor column," the incandescent spot of one of the carbons being relied upon for practically the entire light. The arc light, as we know it today, owes most of its luminosity to the vapor column and very little or none to the electrode or carbon.

Although electric lighting may be said to have begun with this early work of Sir Humphry Davy, the production of the arc in his time was only a brilliant and expensive laboratory experiment and, had it not been for the invention of the modern dynamo, would probably have so continued. While he demonstrated it before the members of the Royal Institute in 1809-1810, using soft wood carbon, it was not until 1844 that Foucault, a French physicist, hit upon the idea of replacing the wood carbon with the carbon deposited in gas retorts. By using this form of carbon, which he cut into square sticks, and what was then known as the Bunsen battery, he was able to produce a steady and luminous light. In fact, he was able to use this arc for photographic purposes. It should be noted, however, that, according to the *Journal of the Franklin Institute* for 1843, Professor B. A. Stillman, Jr., and Dr. W. H. Goode, working in the laboratory of Yale, secured photographic impressions using a battery of 500 cells in 1840.

THE Foucault arc light was exhibited publicly in Paris and its use for lighting houses and streets became a matter of much discussion. It could not, however, compete with gas, oil or tallow candles. The lamps had to be controlled by hand (it was not until 1845 that Thomas Wright, of London, devised a lamp in which the carbons were automatically adjusted), and there was great inconvenience attached to the use of batteries. For this reason most of the work done in attempting to introduce the new "light" at this period was evanescent, although much of it was interesting and backed by many persons of influence.

As a matter of fact, the first practical work belongs to this period when an "electric sun" shed its beams upon the stage during the presentation of

Rossini's opera, Moses, at the Paris Opera House. This interior employment of the arc was matched by the Frenchman Deleuil on the Place de la Concorde, where he placed a lamp on the statue of a woman typifying the town of Lille. This caused much public comment, but it was not particularly impressive, as a man had to be constantly present to regulate the lamp by hand. Some time after this exhibition other lamps were set up on the Pont-Neuf over the Seine, on the Arc de Triomphe at the crest of the Champs Elysees, and in the large court of the Palais Royal.

Popular writers, a report of the United States Bureau of the Census dated 1902 tells us, have been accustomed to date the beginning of what then was called the "modern period of arc lighting," dependent upon dynamos as sources of current, from the work of Z. T. Gramme, a Belgian inventor. His first patent was taken out in 1870 and his first dynamo electric machine was submitted to the Academy of Sciences in 1871. But, continues the report:

> "While this view is fair and broadly justified and while the modern central station was founded upon such apparatus, it must not be forgotten that commercial arc lighting had already been accomplished with other types of electric machines; that a vast amount of successful work had already been performed in the prosecution of such apparatus, and that all this machinery was based primarily upon the law or principle discovered by Faraday, according to which, if magnets or coils of wire be constantly moved or displaced in relation to each other, electric currents are set up in the wires or conductors, the quality of the current depending upon the strength and number of the magnets, the velocity and direction of their movements, and the number of coils or the turns of wire in each one of them."

There is much evidence that long before the days of Gramme arc lighting had actually been accomplished on a large scale with older type of apparatus. For example, under the superintendence of Faraday, the Light House Department of England, employing what was known as the Alliance apparatus, devised by Nollet and Van Malderen of Belgium, introduced the electric or arc light in its important beacons at South Foreland and Dungeness, commanding the Straits of Dover. Preliminary trials were made in 1857 and the first beams of an intensive electric arc were thrown across the sea from South Foreland on December 8, 1858, and from the cliffs of Dungeness on June 6, 1862. Strangely enough, the Alliance dynamo which was used had been built originally for the purpose of decomposing water in order to employ the resulting gases in the production of light.

Shortly after the introduction of the Gramme improved dynamo, which gave great stimulus to electric lighting, a new era began on both sides of the Atlantic. In 1876, Jablochkoff patented his arc lamps all over the world, and they were soon seen in both European and American cities. One of the first places in which they were used in this country was in the Wanamaker store in Philadelphia.

But American inventors did not leave the field to foreign competitors. During the closing years of the third quarter of the last century there was an enormous outburst of activity on their part with a corresponding movement in finance and industry. Among the leading workers of this period were Charles F. Brush and Edward Weston, the former working at Cleveland, Ohio, and the latter at Newark, N. J. Both of these men worked along the lines of the development of series arc lighting, and their systems were soon widely introduced both in this country and in Europe. Turning again to the U. S. Bureau of Census for information, we are told:

"The first Brush series arc lights were erected in the public squares of Cleveland, Ohio, in 1879, and shortly thereafter Brush electric lighting companies were started in all the large cities and town of the country, millions of dollars being raised for this purpose, and leading public men associating themselves readily with the enterprises. The first central station operating arc lamps was installed by the California Electric Light Company of San Francisco, in 1879; the Brush system was employed. Neither Europe nor Asia escaped this American influence, for the Brush system was introduced in England at a very early date and companies were organized in Japan and China also." Early efforts were also made to introduce the arc lamp indoors, and in October, 1878, Brush exhibited a small arc lighting dynamo in Boston which later was put into operation in a clothing store for advertising as well as for illuminating purposes.

The success which eventually attended arc lighting, and its adoption for both street and indoor industrial illumination, certainly must have had its effect on the perfecting of the incandescent lamp. We do know that several distinguished inventors on both sides of the Atlantic—notably Swan, Lane-Fox, and Crookes in England, and Edison, Brush, Sawyer and Man, Weston and Maxim in this country—devoted their energies partly or exclusively to this field. The production of a perfect commercial incandescent lamp became a race for a prize of inestimable value. This story of the incandescent will, however, be told in another chapter.

SURGES AND FLASH OVERS

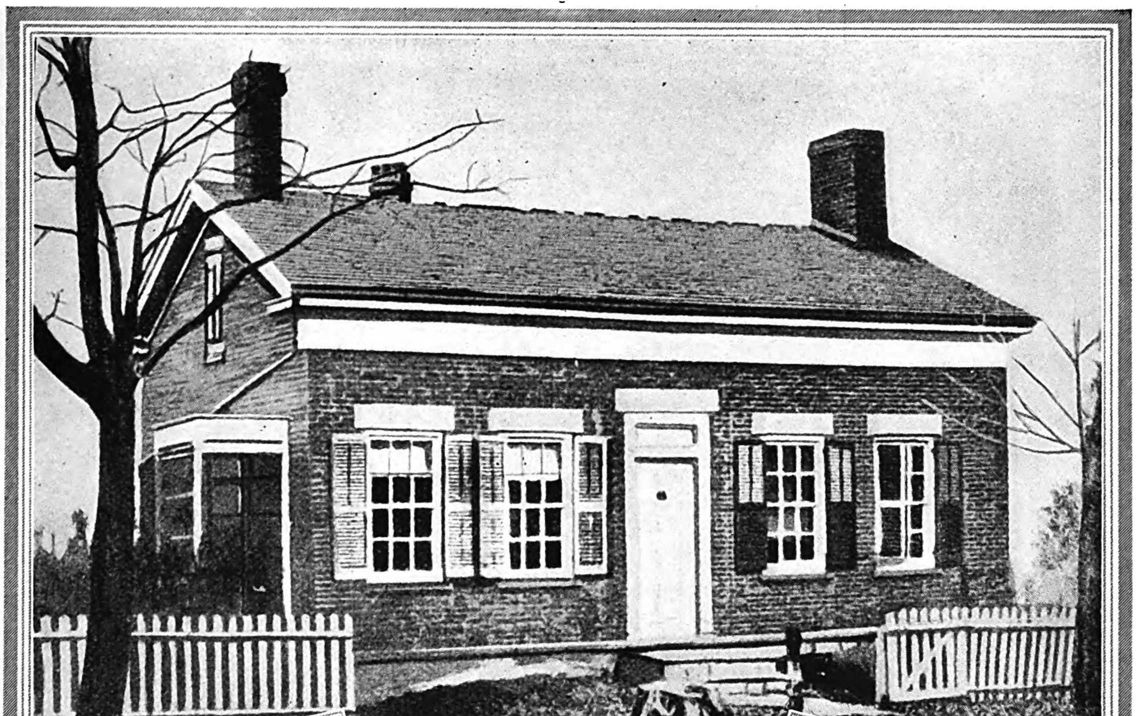
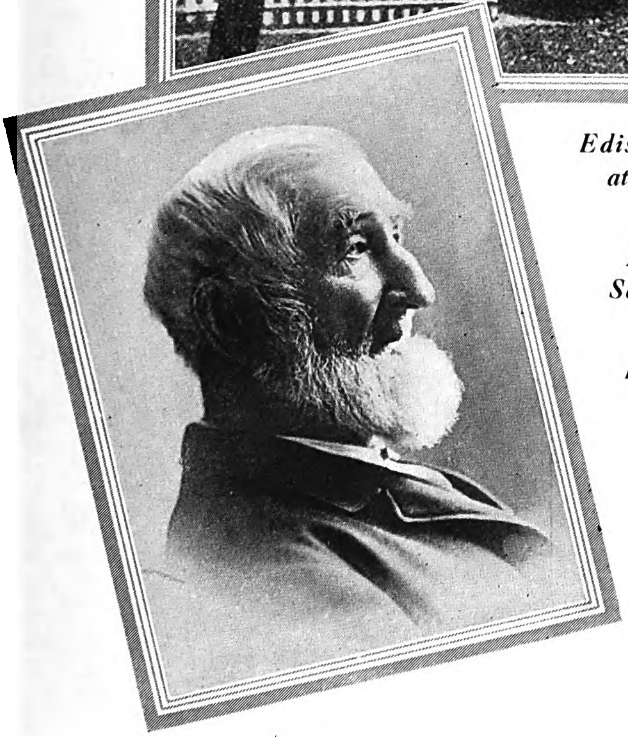
THROUGH THE YEARS WITH EDISON





Edison's Birthplace at Milan, Ohio

◆ ◆

His Father, Samuel Edison

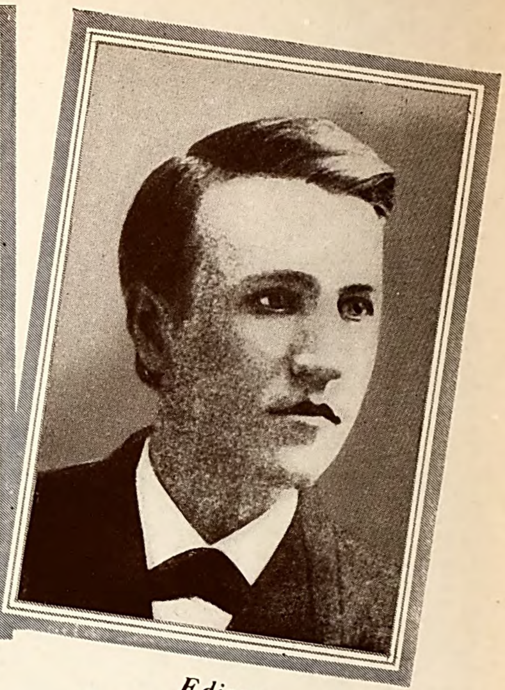
◆ ◆

His Mother, Nancy Elliott Edison

The founder of the Edison family in America came over from Holland in 1730 and settled in New Jersey. Samuel Edison, the father of Thomas spent the first half of his life in Canada, moving to Milan, Ohio, in 1842. In 1828 he married Miss Nancy Elliott, a highly cultured and capable school teacher, the daughter of a Baptist Clergyman of Scotch descent. On February 11th, 1847, Thomas Alva Edison was born in the cottage illustrated on this page. His extraordinary genius for getting at the roots of things was manifested as a child, although his ceaseless questioning caused some to think that he was deficient in powers of comprehension!

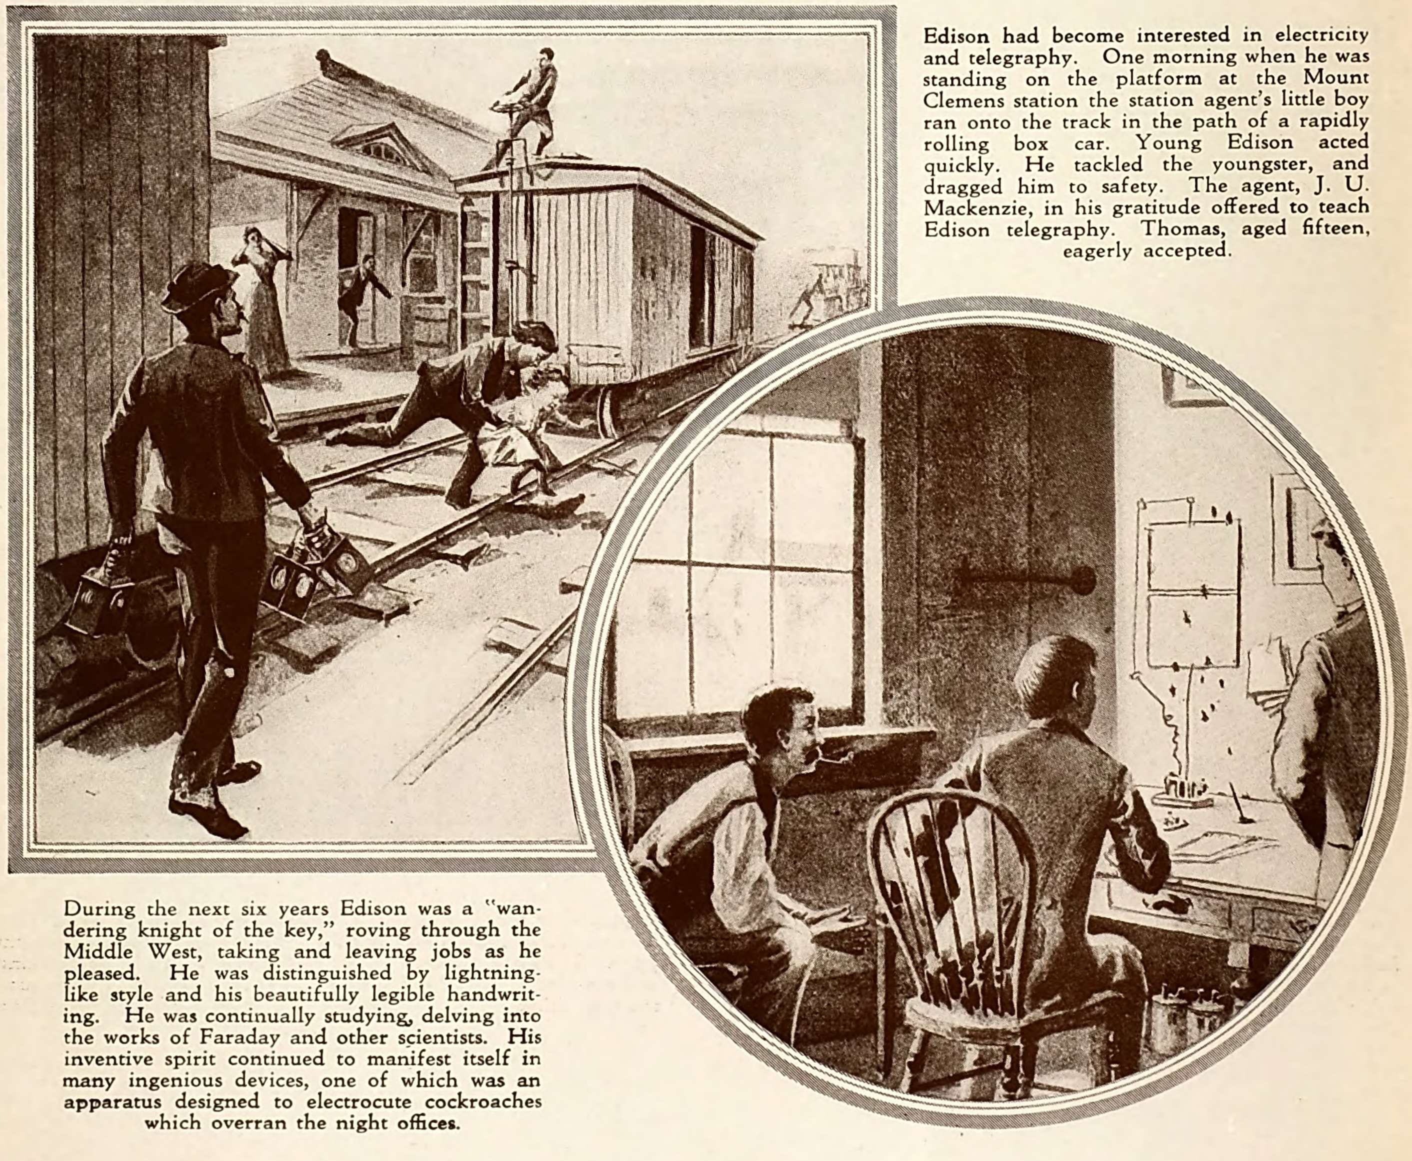
Edison, the Newsboy

At the age of twelve Thomas became a newsboy on the Grand Trunk local between Port Huron and Detroit, Michigan. In the baggage car, where he was given space for storing his papers, candy, etc., he set up a second-hand printing press and started publishing his "Weekly Herald," the first newspaper ever to be printed on a moving train. There, also, was to be found a small experimental laboratory. One day a lurch of the train threw a stick of phosphorus to the floor. It burst into flame. The fire was put out by the baggageman who immediately afterwards ejected the boy and all his paraphernalia, at the same time boxing his ears.



Edison, the Young Telegrapher

Edison had become interested in electricity and telegraphy. One morning when he was standing on the platform at the Mount Clemens station the station agent's little boy ran onto the track in the path of a rapidly rolling box car. Young Edison acted quickly. He tackled the youngster, and dragged him to safety. The agent, J. U. Mackenzie, in his gratitude offered to teach Edison telegraphy. Thomas, aged fifteen, eagerly accepted.



During the next six years Edison was a "wandering knight of the key," roving through the Middle West, taking and leaving jobs as he pleased. He was distinguished by lightning-like style and his beautifully legible handwriting. He was continually studying, delving into the works of Faraday and other scientists. His inventive spirit continued to manifest itself in many ingenious devices, one of which was an apparatus designed to electrocute cockroaches which overran the night offices.

In 1868 when Edison, aged 21, was a telegraph operator in Boston his inventions began with his patented Vote Recorder. This device, by means of which members of a legislative body could register their votes with switches at their desks, was rejected at Washington because it eliminated filibustering, an indispensable part of legislative action. Edison traveled to New York, penniless, and within three days had repaired at a crucial moment the "gold-reporting telegraph" of the Law Gold Indicator Company, and had been made Manager. In partnership with Franklin L. Pope, a young man in the same company, he founded Pope, Edison & Co., Electrical Engineers. Their advertisement was the first of any firm of electrical engineers.

Edison At 24

Marshall Lefferts, President of the Western Union, engaged Edison to improve the stock ticker. Edison produced his Universal Printer, which he thought was worth $5,000. He would have taken $3,000. When Lefferts asked him if he would take $40,000 the reports are that he came near fainting. Edison immediately opened a factory in Newark, N. J., and started his twenty-hours-a-day working schedule.

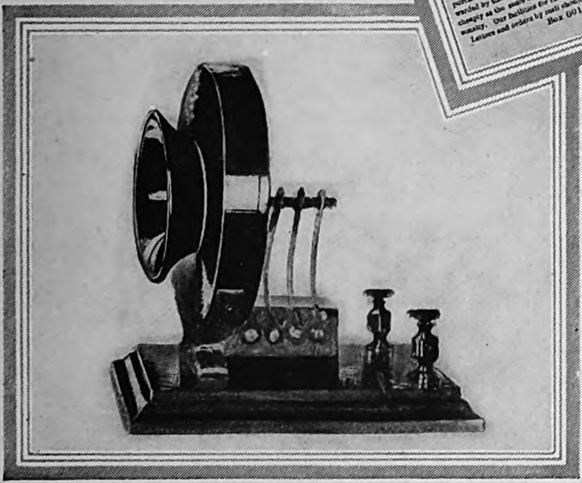
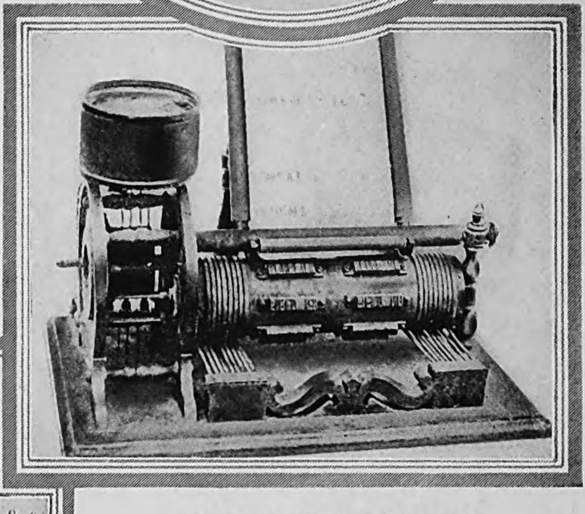
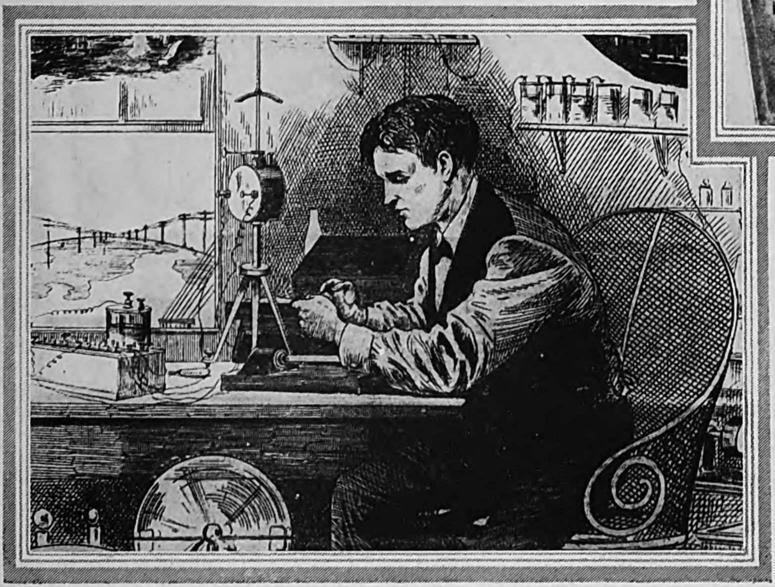
Printer.



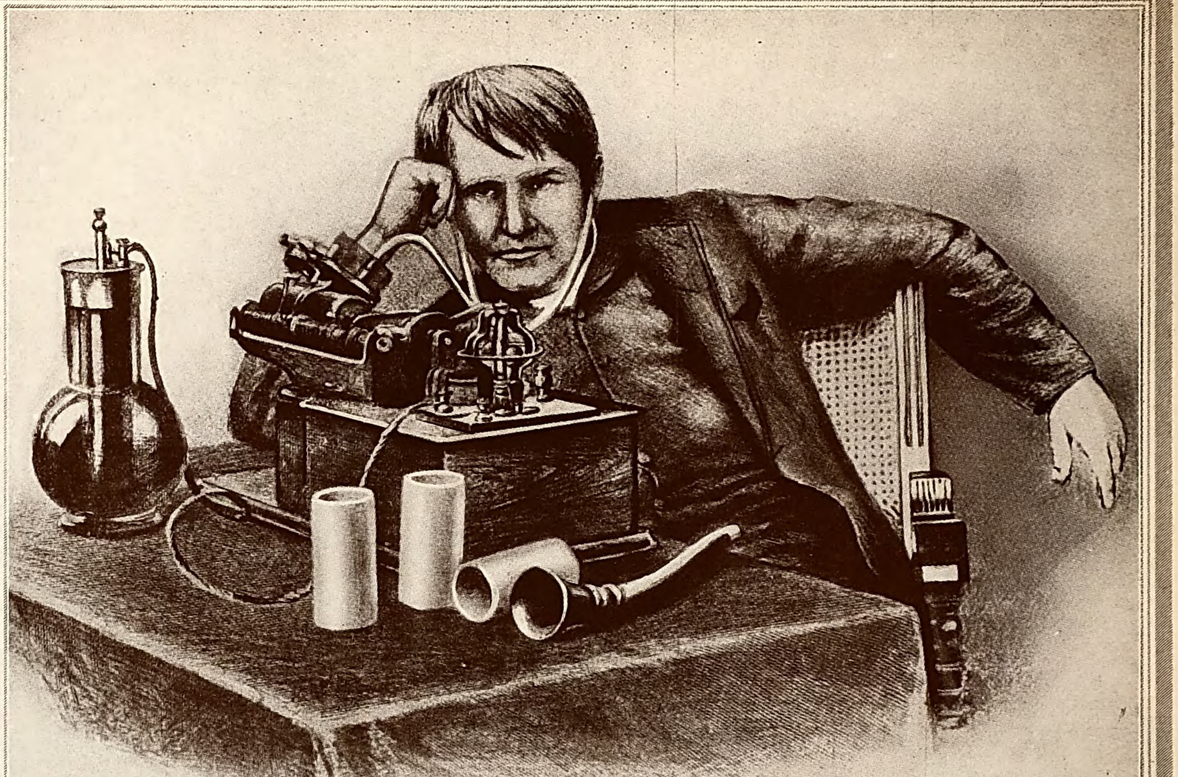
In 1876 Edison invented the Carbon Transmitter, the device that made the telephone possible.



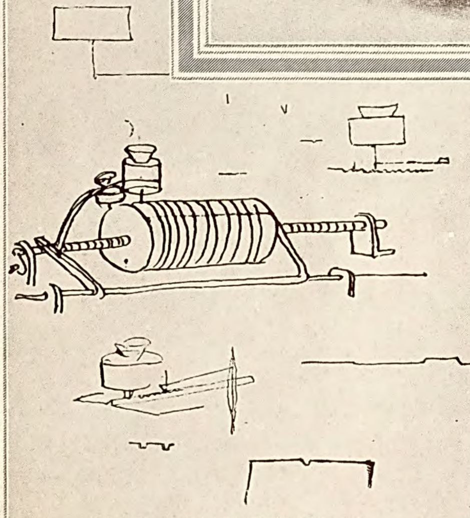
Edison's Vote Recorder



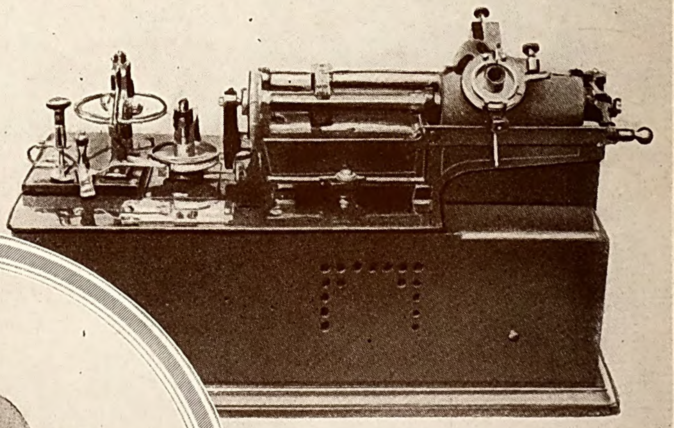
Edison spent the years 1872-1875 developing his duplex and quadruplex telegraph systems. The latter system makes it possible for four messages to be sent along the same wire at the same time, and is Edison's most important contribution to telegraphy.



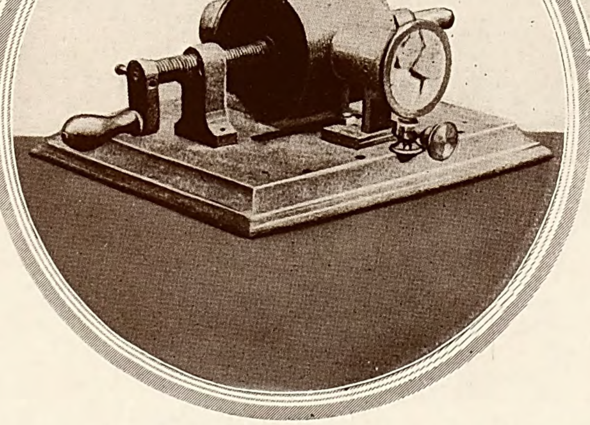
Edison After Five Days and Nights Work With His Phonograph



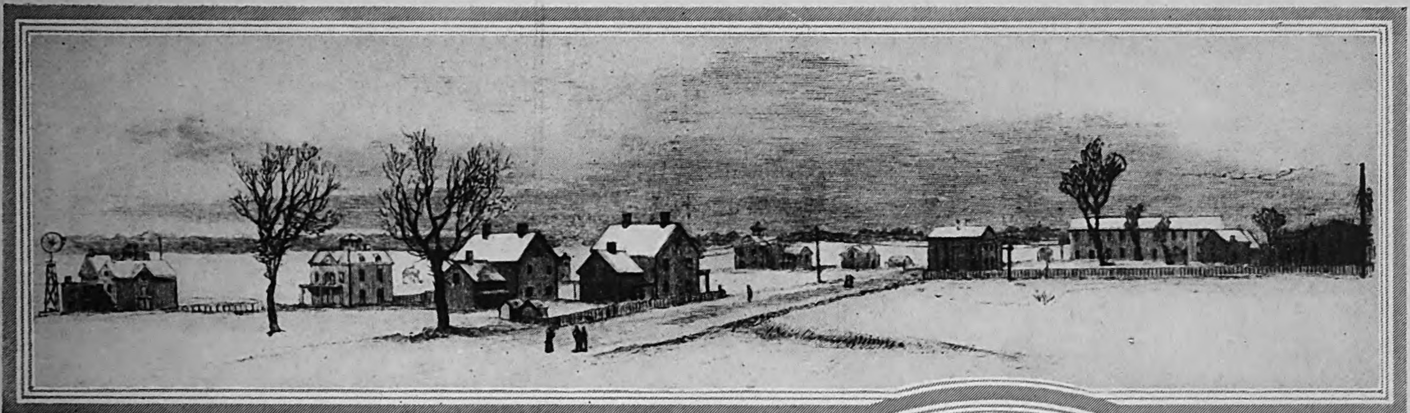
EDISON'S FIRST SKETCH OF THE PHONOGRAPH



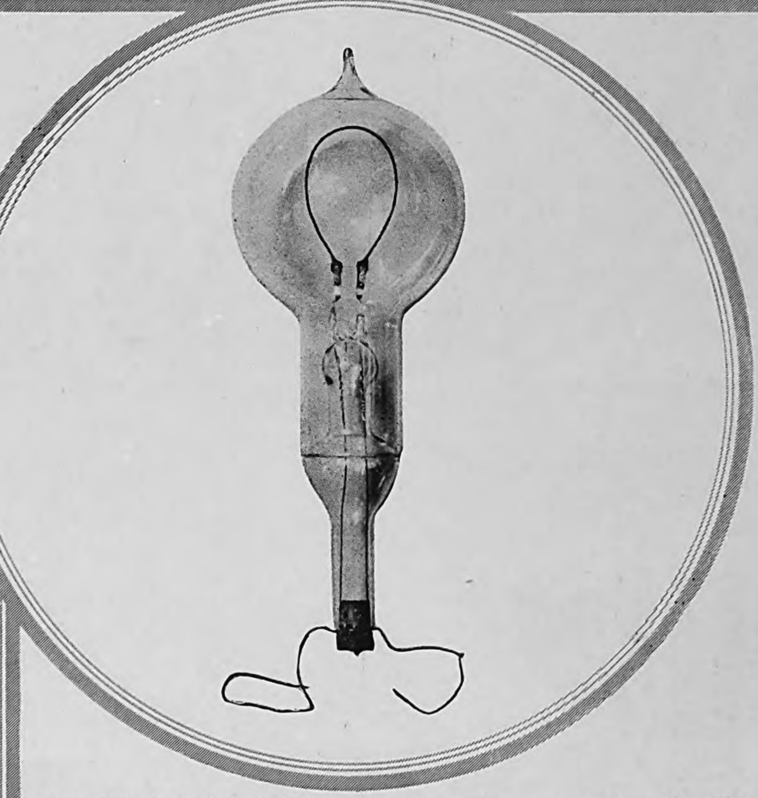
An Early Phonograph



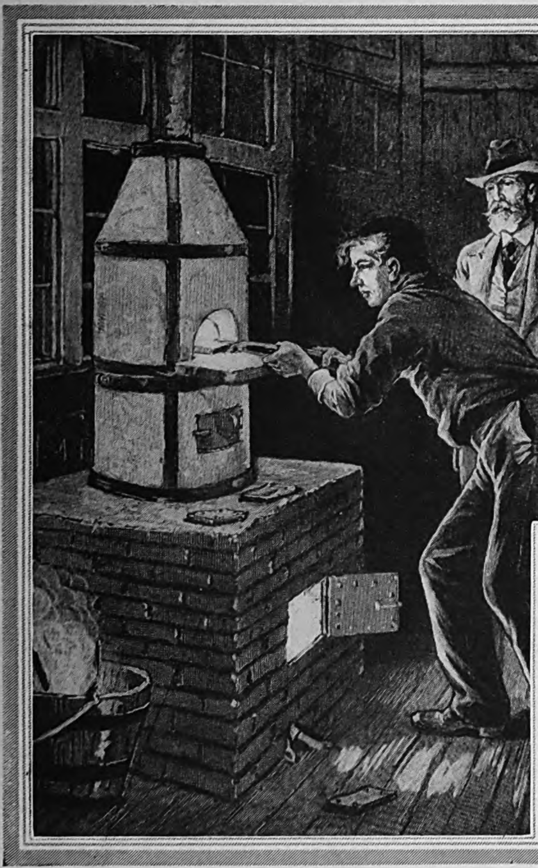
Edison now had plenty of money with which to conduct his experiments. He moved to Menlo Park, New Jersey, where he set up a laboratory. His next idea was that of the phonograph. He made a crude drawing, and submitted it to Kreusi, one of his assistants, with the order, "Make this." Edison himself had little faith that the first model (shown at left) would work. When it audibly reproduced "Mary had a little lamb" he was delighted. He worked hard on this, a favorite invention, and on June 16, 1888, he completed a session of five days and nights of steady work with the assurance that his machine was a practical success. The phonograph brought Edison world-wide fame. Special trains were run to Menlo Park. Edison visited the White House. The Emperor Wilhelm demonstrated the phonograph in Berlin.



Menlo Park, N. J., (shown above—Laboratory on right) was the scene of Edison's greatest conquest. Late in the year 1877 he conceived the idea of an incandescent lamp that would burn brightly, use little current, and be independent of other lamps in the circuit. In other words, he was trying to make an electric light that would replace gas, the problem also calling for a solution of "the subdivision of the electric light." Within a year he had his laboratory fitted out and fifty excellent assistants.

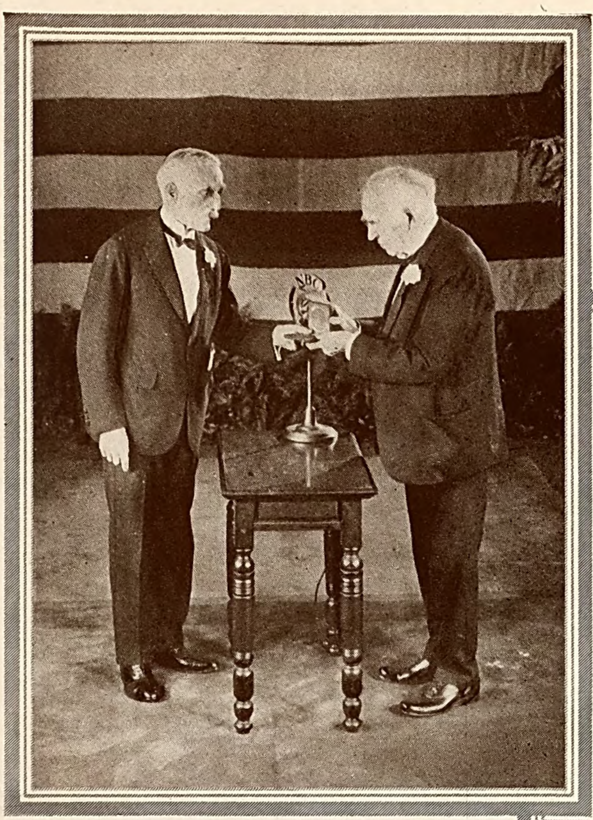


Model of Edison's First Successful Lamp of Oct. 21, 1879



For the filaments of his lamps Edison desired an incandescing substance with high resistance and small radiating surface. He fixed on carbon as the proper material, and he himself made more than 16,000 tests, carbonizing various materials in a small furnace (above). On October 21, 1879, Edison turned the current on in a lamp consisting of a carbonized cotton thread in as perfect a vacuum as he could produce. The lamp burned forty hours, and Edison knew that at last he had succeeded.

Edison and His Chief Assistants in Front of the Menlo Park Laboratory—1879



Edison Receiving Congressional Medal from Secretary of the Treasury, Andrew Mellon—Oct. 20, 1928

This amazing man, now in his 82nd year, is not content to rest with his many achievements. He still works from 16 to 18 hours a day. At present his chief interest is in the discovery or hybridizing of a plant that will produce rubber in commercial quantities in the United States. Besides the Congressional Medal, Edison has received a great number of decorations and tokens of esteem from almost every country in the world. He is keenly alive to all that is happening in the world. Perhaps the greatest of his pleasures is the encouragement of talent and genius in the younger generation.

Henry L. Doherty Prize Paper

Investment Merit of the Electric Utility Industry

By EVERETT W. VILETT

THE prosperity of the electric light and power industry is due in no part to the willingness of investors to advance funds for continual improvement and expansion of service facilities. To continue the industry's success, operating and financing policies must be followed which will react to the favor of creditors, shareholders, and consumers, as needed capital has been and must continue in the future to be obtained from a competitive market where there are many attractive investment opportunities.

The investor, in considering the committing of his capital to the employment of the electric light and power industry, must judge its merits on past performance and future possibilities. To do so requires his intelligent analysis of all factors, operating, political and financial affecting the future, and the application to the net result of a measure of investment quality that will establish the industry's position among other investment possibilities.

General Investment Considerations

To present an attractive field for investment, the electric light and power industry must continue to satisfy fundamental investment requirements. Analysis to determine investment merit of the industry shows among other things, whether: service is in demand by consumers and is liable to continue in favor; management is by responsible people in conformity with existing legal regulations; revenues are sufficient to provide for business expenses, and a suitable return on necessary capital; operating expenses are low enough to enable meeting indirect as well as direct competition; capitalization is on a conservative basis so that after taking care of fixed indebtedness having a prior claim on earnings, there will be left a sufficient amount to properly compensate other security holders; dividend policies are justified by earnings; accounting methods are followed which will bring to light any weakness in the business; the maintenance and retirement provisions are properly cared for so that assets are protected. Individual securities must give protection to the capital of the investor, yield a fair return, and be readily marketable without causing sacrifice in case the investor wishes to sell.

The winner of the Henry L. Doherty prize award for 1928-1929 is a graduate of Massachusetts Institute of Technology and has done graduate study in Banking and Finance at New York University. Mr. Vilett has served the Public Service Electric & Gas Company of New Jersey since 1922 as Cadet Engineer, Engineer in Electric Distribution Department, and at present is Assistant in the office of Assistant to the President

Public Utilities

The public utility field in including such essential industries as those furnishing electric, gas, water, telephone and transportation services, has proven itself to be built on sound principles making for investment merit to securities. These industries, in supplying necessities, are affected with a public interest, and service is therefore usually given under some form of franchise. Direct competitors, for the most part, are thereby eliminated, these utility companies exercising a monopoly in their particular territory. Growth follows that of the communities served, and steady demand and growth result in a steady rate of return on capital invested. The utility business has the advantage of being conducted on practically a cash basis, and a very small amount of investment is tied up in inventories which might be affected by commodity price changes. Due to the privilege of territorial monopoly, such public utility companies are subject to regulation by State Utility Commissions and are allowed by them to operate under rates sufficient to properly compensate capital.

Electric Light and Power Industry

Considering the electric light and power industry in its various aspects, it may be seen to be outstanding among public utility enterprises due, among other things, to its fast rate of growth, to its present great size, and its remarkable prospects for the continuance of expansion. While population in the United States increases yearly at a rate of from 1½ to 2 per cent and industrial growth is at a rate of from 3 to 4 per cent, the electric light and power industry has grown at the annual rate of 10 per cent for the last several years. This compares in the utility field with 6 per cent for the manufactured gas business, 2 per cent for water supply, 10 per cent for telephone, telegraph and cable companies, and a decline for electric railway companies.

It is estimated that the present investment in the electric utility industry is over $10,000,000,000, being exceeded only by that in agriculture, steam railroads and the oil-producing and refining industry. Capital expenditures are averaging around $800,000,000 per year. From 1922 to 1928 there was a 100 per cent increase in the number of kilowatt-hours produced, an increase of 82 per cent in gross revenues and of 81 per cent in the number of customers served. Such increases would be of little importance to the investor if a corresponding decline were immediately anticipated, but the present outlook is for a continuance of growth for many years to come.

Future Prospects for Growth

It is expected that in the next five years total capital investment will increase by nearly one-third and gross receipts by more than one-half. Such expectations are entirely within reason when analysis is made of the present state of electrical development. Approximately a third of the people in the United States still live in houses which are not wired for electricity. Average consumption per home is only about 400 kilowatt-hours per year, and if completely equipped with electrical appliances this would be increased even more than ten times. Use of electrical house heating plants, refrigerators, radios, water heaters and ranges has barely started, not to consider the enormous fields for the more ordinary electric iron, percolator, toaster, washer, vacuum cleaner, fan, etc.

At present the central station industry serves less than half the nation's power needs. Individual plants still generate about 27 per cent, and another 25 per cent is not electrified. Total power requirements have been increasing at the rate of over one million horsepower per year for the last several years, and this increase, together with the electrification of present mechanical power, assures the electric utility industry of an increasing demand.

Railroad electrification, including now about one per cent of the total mileage, has only started, and it promises to be an ever-increasing load. If present cases furnish a precedent, this large energy requirement will be served by the electric light and power companies, as they can unquestionably give the service at both a saving to the railroads and a profit to themselves.

Lighting of streets, highways and airways is in a state of rapid development, and in places where lighting now exists, intensities are being increased.

The public has become "electrically minded," and the industry is viewed with the utmost regard by its consumers. New applications for the use of electrical energy are continually being announced, the end appearing nowhere in sight. If it were not for these new applications, a saturation point might be foreseen where demand, while continually increasing, would do so at a constantly lessening rate. Present estimates do not contemplate any marked change in rate of growth in the next five to ten years, and beyond that predictions of energy consumption, where there is such rapid development, would be little more than an unsubstantiated guess. The outcome of past estimates, however, has been that even optimistic predictions have been exceeded.

Stability of Revenues

There is a considerable diversity of risk in an investment in the electric utility industry, due to the varying character of applications, ranging from domestic to highly specialized industrial usage. General business conditions and total electric kilowatt-hour consumption follow very similar curves, but it is of considerable importance to the investor to realize that residential and commercial use of energy is quite constant, regardless of the prosperity of industry, and although industrial demand does at times fall off somewhat, due to general or local business depression, the loss is in energy sold at lowest rates, the total income of the electric utility company remaining relatively stable.

Operating Economics

The investment merit of the industry has been increased, due to the continual improvement of facilities, to allow greater economy of operation. While other commodity costs were steadily increasing, rates for electricity decreased. This has been brought about to a large extent through engineering developments. In 1919 an average of 3.2 lbs. of coal was required for every kilowatt-hour of electrical energy generated. In 1928 the average was 1.76 lbs. and the newer plants operate on coal rates approximating 1 pound. That there is still room for improvement is apparent in that the most efficient present-day plants convert less than one-quarter of the heat energy in the coal into electricity. Not many years ago low-pressure steam was inefficiently used in cumbersome reciprocating engines. Today plants operate at steam pressures as high as 1400 lbs. per square inch, and energy is generated in highly efficient turbo-generators. Research by manufacturers and operators is constantly bringing improved methods and apparatus into use. It is hardly to be expected that in the near future major and revolutionary changes will be made to greatly cut the cost of production but rather will there be continual slight improvements in efficiencies and in methods that, in the aggregate, will decrease operating expenses.

The increasing demand for electrical energy also favors decreasing unit operating cost, as energy in large amounts is generated more efficiently and at less expense than is possible where generating equipment must be in small units. Decreased cost allows reduction in rates to consumers, further stimulating use of energy. At present the capacity of the plants of the Electric Light and Power Industry is being used to its limit only a few hours a day, and for the rest of the time a large percentage is standing ready to operate, but idle for lack of demand. Increasing application of the use of energy in so-called "off-peak" hours is producing further economies which tend to reduce operating cost. Increase of the hours of use of the plant and therefore the use of the investment is a major problem confronting the industry. Intensive sales programs and readjustments of rates are gradually bringing about the desired result, but there is much yet to be anticipated. The trend is toward economy, and the investor and the consumer will both share the profit.

Adversely affecting operating expenses, although to a much lesser degree than the favorable factors, is the increasing cost of labor and supervisory help in operating the generating and distributing plant. This is the same in all industry, the electric light and power business being no exception, but it is more fortunate than others in that the total labor cost is only a small percentage of the operating expenses.

Personnel

A factor of vital importance to the success of the industry and therefore to be considered by the investor, is the character of the personnel. Due to very rapid expansion, it has been necessary for the Electric Light and Power Industry to constantly add to its operating and supervisory forces. Opportunity for advancement has been excellent, and as a result there has been attracted an aggressive and alert personnel of the highest order, assuring future good management of operation.

Interconnection

Of major importance in the effecting of operating economies is the present practice of inter-connecting the transmission systems of adjacent companies. The time of maximum demand for energy quite often differs between companies, due to difference in type of load served. Operating alone, each company makes an investment sufficient to cover its maximum requirement, together with necessary spare apparatus. Through interconnection and due to the diversity in time of maximum demand, energy can be drawn at the time of one company's maximum from otherwise idle equipment of the cooperating company. Installation of generating equipment is therefore made unnecessary within the limits of the amount of capacity available through interconnection, better utilization being made of the existing equipment. Less spare equipment is required, as the cooperating company can be called on in emergency, assuring continuity of service to customers due to the increased source of energy. Individual plants which operate at lowest cost in interconnected systems can also be operated to capacity, allowing high-cost plants to turn out a minimum of the energy generated. Through interconnection, economical development and complete utilization of water power, otherwise not feasible, due to seasonal flow of water or to location, can be made by bringing this energy within the general network to supplement steam-generated power.

Offsetting the saving of interconnection is the expense of transmission lines and switching equipment so that anticipated economies have to be sufficient to warrant these expeditures. There is also the difficulty of bringing managements together on share of costs and savings to be conceded each company, and as a result interconnection contracts are often very complicated instruments. Mergers and exercise of control by groups with a "community of interest" are tending to bring into being all possible economies of cooperative operation.

Hydro-Electric Development

General hydro-electric development is not progressing at the rate of steam installations. Investment costs in developing water-power sources have increased greatly, operating costs remaining about level, whereas the operating costs of steam plants have shown the marked reduction mentioned above. Logical sites still to be developed are those some distance from load centers, and investment in transmission lines becomes a major consideration. There are generally many political factors to be considered in hydro-electric development, and capital is therefore less ready to assume investment risk where the project is to be hedged about with restrictions. The possibility of hydro-electric power allowing major economies in electrical production is not very probable for some time to come.

Financial Structure

The Electric Light and Power Industry is similar to other public utilities, but differs from other types of enterprise in that the investment in fixed assets is very large compared with the annual income and in the fact that the continuous growth of the industry is constantly requiring additional investment which must be provided largely through new capital. Service is given to consumers at rates such that the gross income is sufficient to cover all expenses and allow a fair return, generally considered as 8 per cent on the investment. This is, in effect, service at cost, for in all industries interest on investment is considered a cost. For each dollar of annual gross income there is an investment of from four to five dollars, the total revenue received from sales therefore being only a 20 to 25 per cent return on the investment. After deducting from this the amount required for operating expenses, taxes, depreciation, etc., and for necessary remuneration of capital, very little remains as surplus to provide for future expansion. This differs greatly from industrial enterprises, where capital is turned over many times a year, and a large surplus can be built up on a small margin of profit, allowing a minimum of new financing to keep up with the growth.

As a result of this characteristic of the electric utility business, new issues are marketed as the industry grows. In 1927 these new issues totaled $2,128,000,000, and in 1928, $1,641,000,000. In 1928 sales were divided approximately as follows:

Mortgage Bonds	27%
Debentures and Notes	29%
Preferred Stock	16%
Common Stock	17%
Stock Sales Direct to Customers	11%
	100%

Forty-four per cent of the total was stock, and it is interesting to note that this compares with about 28 per cent in 1927, indicating the present trend toward stock financing. Reduction in the percentage of maturing securities marketed is continually improving the capital structure of the industry by decreasing the proportion of securities outstanding having a prior claim on earnings.

The spread and average yield of the various classes of securities sold in 1928 were as follows:

		Average
Mortgage Bonds	4.40 to 6.50%	4.69%
Debentures	4.73 to 6.50%	5.22%
Notes	5.00 to 6.17%	5.17%
Preferred Stock	5.00 to 7.21%	5.74%

That capital can be attracted on a basis as favorable as the above shows the high regard in which the investing public holds the Electric Light and Power Industry.

Of particular interest to investors is the large distribution of securities of electric utilities which has been attained in recent years. The policy of selling stock to customers and employees since 1914 has resulted in very nearly 1,800,000 transactions, and although there are many transactions which represent increase in holdings by individuals, the number gives some idea of the extent of those directly holding securities. This wide distribution not only has had a stabilizing influence on security prices, but has brought into being a large group interested in the development of the industry. Public understanding of the economic and political problems before the industry has been furthered and confidence shown in the success of private enterprise.

A new demand for preferred stocks and debentures was brought about in 1928 by the passage in New York State of an act legalizing these issues for certain classes of investment. Life insurance companies under this act may now legally extend their investments to include preferred and guaranteed stocks where earnings meet certain established requirements. This new demand for stocks has undoubtedly had its effect in changing the trend of recent finacing, from bonds to stocks.

The demand for seasoned securities has brought the investment trusts and other institutional buyers into the market for electric utility securities. Banks and industrial establishments also find it profitable to so invest their surplus funds. The removal of securities from day to day transactions, due to holding them for control or permanent investment and the increasing demand for them by such large investors has increased prices and given greater stability to the securities. The ordinary investor may feel confident that the professional is buying electric light and power securities because of their real investment character.

Political Considerations

The fact that the Electric Light and Power Industry is subject to a degree of government control and that present agitation forecasts a possibility of increase, rather than lessening, of that control is of considerable interest to the investor.

The economies of non-competitive operation of electric systems have been so apparent that the industry is in the class of "natural monopolies." To compete with other companies would necessitate considerable duplication of generating plant; would cut down the "load factor" or degree of utilization of equipment, and cause energy to be generated in smaller and less efficient units; would necessitate lining streets and highways with duplicate pole lines; and in many ways create expense which would be reflected in higher cost of service to the consumer.

State Utility Regulation

At first, regulation of electric utility companies was accomplished by a franchise, granted by the municipality, under which certain requirements as to rates and service were to be fulfilled in exchange for the exclusive privilege of providing service.

Economics forces dictated the expansion of companies to absorb nearby plants and to extend into territory outside municipal boundary lines, so that state-wide regulation followed as a natural consequence. With the exception of Delaware, which is at present considering the matter, all states now have commissions appointed to regulate various operating utilities, including the electric light and power companies. This regulation does not assume the function of management, but rather acts as a protection to the consumers and to the purchasers of securities, so that manipulation and irregularities cannot be effected by management and, in turn, protects the companies' interests in so far as unjustified attacks on rates and policies require investigation and decision.

The powers and duties of regulatory

commissions in the different states vary somewhat, but in general their object is to see that the utilities offer a satisfactory service at a rate which will give, but not exceed, a fair return on the capital invested. This allows adjustment of rates, either up or down as required, so that capital is protected and the fair costs of service are met.

It is necessary for the utility commissions in approving rates to establish a "rate base" or legitimate valuation of the property used in serving the public, the value determined limiting the allowable earnings to the amount on which a fair return may be earned. Precedent will undoubtedly establish a method of evaluating a property, but up to the present time there has been considerable difference of opinion as to the underlying principles involved. Methods have been used varying from the use of original cost, deducting for depreciation, which gives a very low valuation, to that of using the cost of reproducing at present-day prices a new and modern facility to perform the same service. Use of present day rather than original cost has been the more common in rate valuations. In a period of rising labor and commodity prices this has proven advantageous to the utility companies and investors, in that allowance is made for the change in purchasing power of the dollar, property value and allowable return changing accordingly.

The investor also receives protection through the utility commissions in that they must pass on all new issues of securities. In so doing they must necessarily investigate the purpose for issuing the securities, the amount of funds that can be profitably employed at a fair return for the purpose in question, the character of securities proposed, and whether rights of other security holders are infringed by the new issues.

Such investigation and approval pretty definitely assures the investor of the soundness of the issues in question. In addition, utilities are required to keep their accounts according to a uniform method, and reports which are available for public inspection must be filed periodically, so that data on financial condition is available and is in such form that it may be readily compared with that of other companies.

Due to the powers granted to public Utility Commissions, which, if exercised judiciously, are to the advantage of the investor, there is also an inherent possibility of danger. An over zealous commission more acquainted with politics than economics might attempt the enforcing of rates for the sale of energy which would jeopardize the position of the capital invested. Some such cases have occurred, and appeal taken to the courts has universally met with the decision, in accordance with the Constitution of the United States, that property cannot be confiscated without giving proper compensation. In the cutting of rates to the point where a fair return cannot be earned on the value of the property, an act of confiscation results and a readjustment of rates has been considered permissible.

The holding company form of control of electric operating companies, which is treated in greater detail later, has caused agitation in some states to bring these companies under the control of State commissions. The New York State Commission has recently led the way in recommending that its powers be increased so that: holding companies will be required to file annual and periodic reports; the commission may investigate the relationship between holding companies and operating utilities; the commission may inquire into the cost and profit accruing to non-utility companies which control public utilities; and that a legal definition of a holding company be given as those corporations which control operating utilities not only through stock ownership, but also through leases or operating contracts and by control through voting trustees.

Further broadening of state utility commission powers in such manner would possibly be of some disadvantage to investors through the commission tending to exercise more of a hand in actual management than is now the case. In turn, advantage would accrue through bringing about statements of earnings of operating companies which could in no way be manipulated, and if any excess profits were being earned, reduction in rates to consumers would undoubtedly further stimulate consumption of energy, so that income would still allow an attractive return to the investors.

There is a definite tendency toward such broadening of state commission powers, although many major problems must first be settled. It is to be anticipated that in some states powers will be increased, and if actually fulfilling expectations will probably receive rather general state-wide application.

Federal Regulation

Under the holding company form of organization the great majority of operating companies are controlled by corporations with activities in more than one state. In a few cases the operating companies are also engaged in transmission of energy across state boundary lines in what might be defined as interstate commerce.

Individuals and organizations of the belief that state regulation is insufficient have sought Federal legislation to provide a superimposed Federal regulation over that already existing in the separate states. The investigation of the electric light and power industry instigated by the United States Senate and now being made by the Federal Trade Commission, will be the basis of proving in or out the advisability of such legislation. At the present time the investigation has disclosed little of importance from an investor's viewpoint, and it would appear that it will be drawn out over a considerable period before any recommendations based on disclosures of the investigation can be formulated in an attempt at legislation.

The danger of politically hampering the natural development of an industry which so intimately serves the public with actual necessities has brought together a large group in the interest of the state commissions, the utility companies and the holders of utility securities, so that the probability of legislation which could in any way curtail the natural development of the electric industry along economic lines seems out of the question.

There are individuals who see in the success of the Electric Light and Power Industry and its security holders the opportunity for making political capital and for the attainment of considerable personal publicity through making statements adverse to the industry's welfare. Persons of radical mind often do perform a service in bringing to the fore situations which otherwise, for lack of attention, would not come into public view. To expect, however, that a decided minority can hope to bring about legislative changes which would injure the normal development of an economic force in present-day civilization, would be to lose faith in the intelligence of the public and their representatives responsible for legislation. Any changes that are made will undoubtedly be in the interest of greater development of the industry and its service, and not adverse to the holders of Electric Light and Power securities.

Government Ownership

There is also the threat of Government ownership which is continually brought up by the politically minded, who see in the Electric Light and Power Industry a chance to put political bureaus in charge of the operation of a highly specialized business. They feel, or at least are not hesitant to state, that large sums may be saved the consumers of electric energy if only the Electric Utility management can be politically controlled.

Fortunately such sentiment is decidedly in the minority, although in sections socialistically inclined there will undoubtedly be sufficient sentiment of this kind to continually keep it with us. A most conclusive proof that it is not to the consumer's advantage is obtained in comparing average revenue per kilowatt hour for electricity generated in municipal and private plants. In 1902 such a comparison shows municipal plants receiving approximately 8 per cent more per kilowatt hour than those under private operation. Twenty years later municipal plants showed an increased average unit revenue of some 26 per cent, while the privately operated plants showed a decrease of 30 per cent, municipal unit revenue being almost twice that of the private plants. It is inherently uneconomic to produce and distribute electrical energy through individual plants such as most of those operated by municipalities. In 1927 there were 187 and in 1928, 152 municipal plants taken over by private systems, this adequately representing the trend away from municipal operation.

The operation of electric systems on a large scale by governmental bodies is no more to be thought of than would be a return of the railroads to Government control after experiencing that control some few years ago. Governments fundamentally exist to do for their individual citizens what those citizens cannot do for themselves, and in exercising the normal and expected function of preserving public safety and order, and determining general lines of social policy, they are not also well adapted to conducting large business enterprises. Private enterprise is more progressive, less inclined to be slow of action, and in the end can give the public greater service than could any bureaucratic control.

The fact that the presidential election of 1928 established in effect the opinion of the voting public in favor of private enterprise, rather than public control, is a very good assurance to the investor that Government ownership and operation will make little headway.

Management

Successful enterprise has for its foundation and principal asset good management. In the final analysis investments are primarily made in men as leaders of enterprise and in the strength and character of those leaders is the strength of the investment.

The Electric Light and Power Industry in the United States, from its first operations under Mr. Edison and his associates, to the present day, has been favored with excellent management. Evidencing this is the fact that one is unable to find a single instance of default among the financial obligations of companies doing solely an Electric Light and Power business. An analysis of companies with gross earnings of over $1,500,000 per year, the combined capitalization of which represents more than 90 per cent of the industry, shows that current cash dividends are being paid on all first preferred stocks and in no case are there accumulated back dividends.

Management of the industry has been successful in directing cooperative effort of science and finance. Great strides have been made on the side of science but only because financing has been possible. In the early stages of expansion and until not many years ago the industry had considerable difficulty in procuring funds. Equipment manufacturers close to operating companies accepted preferred stocks in payment for apparatus, but it is notable that dividend rates of around 8 per cent represented their estimate of the element of risk. Management has since demonstrated its ability, the credit standing of the industry today being such that preferred stock issues at rates as low as 5 per cent have been successfully marketed. In keeping the industry prosperous and in building up a healthy financial record, a strong foundation has been laid for the inevitable expansion of the future.

Control

With control in the hands of local groups, capital could be attracted from rather a limited field. Large operation with large security issues offered improved investment character and a broadened market for security issues. Added diversity of investment, and improved credit standing were possible through operation of properties serving varied industries in separated sections of the country. Due to these factors, the holding company form of organization and financing came into being, these companies selling their own securities to the public and using the proceeds in procuring control of operating companies. Companies which previously could not hope to attract capital were able, on advances from the holding company, to successfully expand and make available better service. In protection of this financing and in the interest of economical operation, the holding companies gave advice in matters of policy and engineering. Separate functions of the industry, such as management, finance, specialized engineering and operation, previously existing in independent and uncoordinated enterprises were combined as obviously better accomplishment could be made through cooperative effort with one unified purpose. Management, controlled as to allowable return on investment in operating companies, received compensation for its efforts in perfecting necessary supplementary enterprises, and although holding company form of control has been subject to attack on this account, it has amply justified its existence through economies in operation which have allowed reduction in rates to consumers, and made available increased earnings for investors.

The benefits of cooperative enterprises have by no means been exhausted, the present being an era of mergers and consolidations of existing operating and holding company groups, to take advantage of further possible economies. The public mind has been greatly influenced by utility grouping to the extent that we have progressed from a "trust busting" period to one of "big business," and railroad, industrial and financial grouping has met with favor largely through the successful precedent the utilities have established.

Analysis of the position of holding companies from the investor's point of view is very difficult. They hold little or no physical property, but rather stocks and bonds of operating companies. Against such assets their own financing must be done through collateral trust notes or stocks secured by the earning power of the securities owned.

Earning statements are difficult of analysis as statements of each underlying company require examination to ascertain actual condition of the group. In turn, however, each of the operating companies controlled is functioning under a State utility commission so that its position may be taken as sound. The industry is well established and holding company securities are backed by those of operating companies. Record of accomplishment in the great proportion of cases is excellent and investment merit is high.

The investor in either the operating or holding company must consider the men controlling his funds and invest in the industry, in that part of the controlling structure, and in that type of security, which fits his purpose. Rapidly expanding holding companies may prove even stronger than those of conservative policies or than established operating companies. Investments in holding companies, however, while having some advantages not applying to operating companies, and while they are fundamentally investments in the Electric Light and Power Industry, are more investments in men and management than is the case of investments in operating companies, and securities must be rated accordingly.

Conclusion

The investor in reviewing the position of the Electric Light and Power Industry can well feel that it offers sound investment merit. The industry is well established in providing an essential service to individuals and business enterprises, and has possibility of future development that even exceeds the possibilities of growth in population and wealth of the United States. The outlook is for better utilization of present investment through new applications for the use of electrical energy and for

Teaching Electricity

A British Viewpoint

From an Article in the Electrical Review (London)

ELECTRICITY in the school curriculum is not a suggestion; it is a necessity. The time has come when compulsory lessons in elementary electricity are as essential to the growing generation as lessons in civics and morals. To realize this, it is only necessary to consider how vital electricity has become in everyday life, and how deeply and thoroughly it has permeated the entire social and national fabric. Although the definition of electricity has so far proved an unsolvable riddle to engineers and scientists, all are aware of the illimitable benefits it confers on mankind, and that today it ranks as the most vital factor in improving the standard of living, and in adding to the comforts of all and sundry.

It does, or can, provide our homes with heat, our factories with power, and our homes, shops, factories, streets and even roads with light. It forms the basis of the telephone, wireless, and innumerable other conveniences of modern civilized life, which add so much to our comfort, or deduct so much from our daily expenditure of energy.

It is axiomatic that if any radical reform in the social code is to be effected, the simplest and most successful method is by inculcating it into the minds of the younger generation. It is not suggested that a radical reform in electricity is necessary, but there is a necessity for a wider utilization of its benefits, and a greater realization of its potential possibilities.

Let us see first why electricity should be taught in the schools—then how it should be taught—and finally—what results we might reasonably expect from its teaching. Electricity has become part of "our daily bread." It touches the life of each individual in so many different spheres than an elementary knowledge of it should be in the possession of all.

In every field of activity where it has been applied, its beneficial influences have been conclusively proved. Its wider adoption is only limited or retarded by the "electrical" ignorance and indifference of the ordinary public. It spells advancement, and there seems to be ingrained in the human make-up a conservatism against all forms of advancement. Such conservatism can only be overcome by education—not, as many erroneously believe, by "push" sales methods or extravagant and indiscriminate advertising—and the obvious place to apply this education is in the primary schools.

If a general conception of electricity and its uses were implanted in the juvenile mind, it would be the first and most important step in eradicating conservatism, overcoming the present widespread indifference, and would tend to produce enthusiastic crusaders in the cause of electricity.

It is not a "dry" subject, and if properly presented, would prove so interesting that the young student would be anxious to delve deeper into its secrets and possibilities. We have only mastered the rudiments of electricity, and while present advancement is certainly rapid, it would be many times more so, if universal electrical education were adopted.

It is necessary that the public should be educated in regard to the cost of electricity, for the average man in the street does not view this matter in the correct perspective. Let teaching follow the line that the cheapness of electricity cannot be judged solely by pound, shilling, penny standards, but by standards of life, of comfort, and of convenience, for the supply of electricity is not a commodity but a service, and that service which attains nearest to perfection in modern civilized life.

The main thing is not to teach the growing generation "electricity" but to teach it to think electrically and to live electrically. The more essential and simple elementary facts should be taught, but the main programme should deal with what electricity is doing for mankind, what it can do for mankind, and what it will do for mankind.

Stress should be laid on those little everyday applications of electricity which add so greatly to our comfort, convenience and amusement; on those bigger applications in commercial and industrial life, which add so greatly to our national wealth and have proved so vital in raising the standard of living of all grades of society; and on those finer applications in medical science and similar spheres, which are doing so much to alleviate suffering and to increase the individual and national welfare.

The inclusion of this extra subject will not lay a great burden on the teaching profession, for it is not suggested that any attempt should be made to impart technical knowledge of electricity to primary school children. Many of the leading men in the electrical world would not consider it beneath their dignity to compile for the guidance of teachers a small book which would adequately meet the requirements without loading it with terms or technical knowledge, which would confound the juvenile mind.

The direct result of this electrical education would be the gradual and sure eliminating of the universal indifference, replaced by an enthusiasm for everything electrical. A wider knowledge would lead to the wider adoption of electrical methods with increased demand for electricity and electrical appliances. This is what all branches of the electrical industry are clamoring for, through all kinds of societies, committees, and advertising channels. *The wider application of electricity will inevitably result in cheaper electrical supply and cheaper appliances. This is what the public is waiting for.*

National interest would be a vital force in stabilizing the electrical industry, which, by virtue of its innumerable ramification is, or should be, the most vital industry to the nation.

Indirectly, this education will give an impetus to electrical research, invention and development, and it is difficult to anticipate just where electricity will stand when the present generation has grown to manhood. It is sufficient that it will be imbued with the electrical idea; and will be ever ready to contribute in all ways to this branch of science, which has already proved so vital to modern civilization.

H. M. Byllesby Prize Paper

Six Words in an Accountant's Life

BALANCE USEFUL CONTROL RESEARCH
REPORTS PERSONALITY

By WILLIAM A. O'NEILL

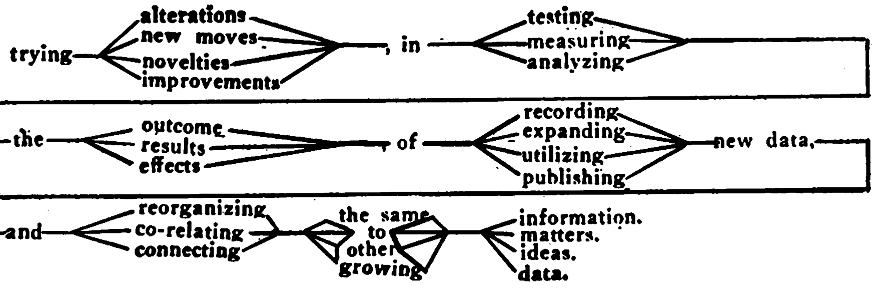
"BALANCE" is a word that has been associated with the functions of accounting, in the mind of the average person, since 1492, when Luca Paciolo wrote the first treatise on double-entry bookkeeping. From that time until the early part of this century the business man was pleased, perhaps I might say relieved, when he was informed, "The books are in balance." Today, the word has slight significance in our industry for the reason that every one in authority, at the very least, expects the books to be in balance. We need no more positive proof for this statement that the question propounded in the H. M. Byllesby Award,—"How to increase the usefulness of the accountant in the public utility industry?" Certainly, those of us whose privilege it is to serve in the accounting field of our industry should feel grateful over the knowledge that Colonel Byllesby not only thought of us as being useful, but left his associates sufficiently inspired, with the result that they now desire to increase our usefulness.

In view of the fact that accounting embraces both the fields of Art and Science, I sought the opinions of men associated with our industry (in these fields), with the hope that their views might be found not only interesting but profitable to my fellow accountants.

Dr. Willis R. Whitney, asked how he thought the accountant could increase his usefulness, wrote and diagrammed:

"Increased usefulness can be brought about first and forever by being intelligently dissatisfied and appreciative of the possible assets in change, because this is everywhere a growing, improving world. Change is the surest thing we know, so expect and participate in the changes.

"Usefulness can be increased by—



Mr. O'Neill's paper won the 1928-29 *H. M. Byllesby first prize award. Mr. O'Neill has been with the Electric Bond & Share Company, New York, since* 1923. *His accounting experience has ranged through the mercantile, coal mining, automobile and public utility fields.*

"'Usefulness' cannot usually be anticipated. By trying new combinations of old data, some combinations are found interesting, then desirable and then indispensable. So do not wait until you know the need for something, but try the effect first. No one wanted radio—it was tried first. So was induction, so was X-ray and so was steam."

Dr. Whitney closed his letter with a real message to all accountants. He states: *"This attempt shows you how far I am from knowing accounting, but I know it's mixed up with change because everything else in the universe is."* I shall leave Dr. Whitney's thought provoking message with you without further comment.

Control

So we come to the word "Control'—a word that I trust will retain always a prominent place in the vocabulary of our accountants. The force of the word was brought home when I asked a man who is in the first ranks of the operating field—"How may we be more useful in our industry?" He said: "The accountant must learn more about the business—he must not be content with balancing accounts, he must know the physical facts making up the accounts—in effect, he must have the accounts under CONTROL." When asked—"Why more of us did not reach the top?"—he replied; "Perhaps you allow the figures to control you, rather than you controlling them." Certainly, there is food for reflection in this friendly suggestion. How many times have we been asked:

What is your annual gross revenue?
What is your annual operating expense?
What is the population of your town?
How many customers do you have?
How many employes do you have in the office?
What day do you close your records?
What class of securities does your company have?

And to our questioner's surprise, we have to refer to a report for the answer. Yet we will go home and expect our children to master ten or twenty lines of Latin verse in one day, or a part in a play in one week—while we, because we are thinking in the terms of balance in place of control, have not acquainted ourselves with the ordinary physical facts that surround our daily work.

May I, at this point, offer a suggestion? Some evening after the office has closed and you are alone with your own thoughts—ask yourself: How much control do I have over the pay roll, the purchase and stores, the cash and the customers' records? Am I able to tell the story that these records contain by the fifth of each month? How many entries do I develop from these records, that I do not know the full reason for their being made? Has the purpose of the entries been fulfilled? If you can answer these questions, then it is fair to assume that your records are under control—if you cannot, then you should seek the cooperation of your associates in the "operating," "engineering," "merchandising," "rate" and "statistical" departments, so that their requirements can be incorporated into a workable scheme of control.

When we have reached the stage where we have "Control," then we can strive, in the language of Dr. Whitney, —to become increasingly useful—which brings us to a word that has for too long a time been neglected by the accountant, "Research."

Research

Do you think it would be overstating the case if it is suggested that practically all of the research work undertaken to date in the field of accounting has been done with the thought in mind of solving specific problems? We have not attempted to follow the example of the chemist or the engineer in making fundamental, scientific investigations into the science of accounting, without respect to their practical applications. As a general rule, we try to visualize some goal we wish to reach and then lay our plans accordingly. I would like to see the accountant borrow a few thoughts from the field of Pure Science. To illustrate this point, I shall quote from the address of Irving Langmuir on January 13, 1928, at the time he was presented with the Perkins Medal, which address was reprinted in the April 1928, issue of the N.E.L.A. BULLETIN. At the same time I suggest that if you have not read the article, do so, as it contains many pertinent suggestions that should be useful to the accountant.

Dr. Langmuir, in speaking of the types of men who are best qualified for scientific investigation, says:

> Then, too, the best type of research man does not like to be told too definitely what must be the object of his experiments. To him scientific curiosity is a greater incentive than the hope of commercially useful results. Fortunately, however, with proper encouragement, their curiosity itself is a guide that may lead to fundamental discoveries, and this may solve the *specific problems* in still *better ways* than *could have been reached by a direct attack.*

At another point he stated:

> "I believe in the near future there will be a much increased demand for men with scientific training who are capable of doing more independent thinking."

Certainly this statement holds as true in the field of accounting as in chemical research. Dr. Langmuir deals in an interesting fashion with an important adjunct of research when he states:

> "Our schools and universities devote so much effort to imparting information to students that they almost neglect the far more important function of teaching the student how to get for himself what knowledge of any subject he may need."

He goes on to say:

> "Much of the knowledge of data upon which these principles depend and other necessary information should be obtained through *experimentation* and *individual reading.*"

Summed up, if we learn these lessons outlined by Dr. Langmuir, we are bound to be stimulated to a healthy interest in mastering the principles of our business and then building our methods, systems and reports accordingly.

Some may ask at this point—How can the accountant do the research unless he has a goal for each problem? I suggest but a few matters that can be profitably researched, not for the purpose of saving a definite amount of money, but to learn if the methods and practices in vogue have kept pace with the changing conditions:

> *Classification of Accounts*—Of what benefit is it to a company to analyze continually month in and month out operating revenues and operating expenses of a small town or community in the same manner and detail as is done for a large city? What would happen in your particular company if you reduced the classification of operating expense and fixed capital accounts, say 50 per cent, but increased your knowledge of the sources of revenues?
>
> *Merchandise and Jobbing*—As it is practiced in other industries as a guide to our own problems.
>
> *Automobile Operation and Control.*
>
> *Cooperation with the Field Force*—How much could the accountant learn about payroll distribution or stores control, if he took a month off and labored with the line or construction gang?

If the accountant never saved a penny as a result of approaching these problems in this fashion, I hazard the guess that he would, nevertheless, be doing what my operating friend suggested—"Learning more about the business."

If we have *balanced* our records, are in *control* of the original source of information, have instituted the practice of *research,* then it appears safe to assume that we are in a position to discuss the fifth word in our treatise, "Reports."

Reports

Elizabeth Luther Cary in a review of several papers, on Metropolitan Museum Studies, dealing with Greek Art, and Photography, states:

> "Care and scrupulous accuracy more often than not carry with them an intellectual quality in statement which even the reader uneducated in the special subject discussed finds himself first respecting and later enjoying."

The day I read this review there came to my mind—"What are we accountants doing to make our reports—our monthly letters, read as they should—are we telling the romance of the business? Its victories—its weaknesses—its improvements—its hopes for the future, in a language that will interest our associates. If not, we should, for when all is said and done the reports should not be technical in character. They should be such that each man charged with a definite responsibility may find the guide to the solution of his problem. That is our function as accountants—accounting by itself is of no value. In our business, an accountant reaches the peak of his service if he can complete reports that do not have to be interpreted by him. In effect, his service is paradoxical in that the less he has to be summoned to answer questions regarding the reports he completes, the more valuable he becomes to the organization. Therefore, we should strive always to make the reports interesting. You have known men who will sit up half the night reading a detective or mystery story, and if the truth were known, these stories are not half as interesting as a running story of the construction of a transmission line through the mountains, or the development of a hydro site along the Missouri River, or the rehabilitation of a system in the flooded area of the Mississippi.

Mrs. Anna Steese Richardson, director of Good Citizenship Bureau, Woman's Home Companion, at the Woman's Committee session, New England Division, N.E.L.A. convention, September 13, 1927, in a talk entitled "The Dignity of Your Job," which was reprinted in the December 1927, issue of the N.E.L.A. BULLETIN, tells of an early experience as a society reporter for a midwestern city paper:

> "How bored I became with interviewing this hostess and that, writing long lists of names and silly decorations and dresses! In those days I did not even dream that I would reach millions through one magazine every thirty days. Today I do not see even the keys of the typewriter on which I write my monthly message to these millions. I see them—their homes, all over the United States—their activities—their interests—their needs—their ambitions."

We can do the same as Mrs. Richardson if we will but try. As a suggestion —go to your President, Vice-President, or others whom you serve—tell them you want to make your report more interesting to them. Explain to them that the accounts can be made to produce the answer to their questions. I am sure that we will be as agreeably surprised at the encouragement and help that lies within our grasp as others have been who have done this, if we will but seek it with an *open mind.*

Personality

Naturally, the approach to those associated with us will involve the word, "Personality," and while it is last in our

The Erection of Buildings and Other Structures by Electric Arc Welding

By B. S. HAVENS

General Electric Company

A YEAR or so ago the Supreme Court of Harrisburg, Pa., found it practically impossible to hold its sessions because of the annoying hammering of pneumatic riveters at work on a new office building adjoining the chamber. In order that the sessions might continue, it was necessary to issue a court order stopping the riveting while the court's term got under way.

Anyone who has ever attempted to carry on a telephone conversation, or to do any kind of business in an office near which riveting is going on, would very probably consider any method for the silent erection of buildings a blessing. And there is such a method. In July, 1928, Frank P. McKibben, nationally known structural engineer, listed a total of 85 structures erected by electric arc welding, including 43 buildings.* In one year these figures jumped 50 per cent: the total number of welded buildings increased to 65. The most notable development was in the increased height and size of the buildings involved.

Fortunately, the elimination of the noise nuisance is not the only advantage of the use of welding for this purpose. Early in 1927 the General Electric Company realized the advantages resulting from the use of welding, and accordingly decided to use welding instead of riveting in its future factory construction programs wherever it was practical to do so.

In order to design a welded building, however, it was necessary to design the principal or most important members. In factory buildings, for example, one of the most important members is the roof truss. A suitable design of welded roof truss was soon evolved and a 1,000-ton factory building was erected for the General Electric Company in Philadelphia shortly thereafter. This building used welded construction throughout, and all the roof trusses were welded by the American Bridge Company following the new design.

Had this building been riveted instead of welded, larger metallic sections would have been necessary, as rivet holes are responsible for certain losses. This loss, is equivalent to a strip of metal the full length and thickness of the part in which the hole is punched, and as wide as the diameter of the rivet.

Furthermore, in riveted structures, gusset plates are required to connect the various members together at their intersections. In the welded type of construction, members are directly connected to each other. General Electric experience has shown that these two items alone result in a saving of from 12 to 15 per cent in the amount of steel required.

So the welded building was theoretically feasible. And it was found to be thoroughly satisfactory in practice. Soon plans were made by this company for two more buildings which, although smaller, were also to be welded. One of these was erected at the Bridgeport, Conn., plant, and the other, at Pittsfield Mass. Their construction was marked by but one difference from that of the Philadelphia structure.

Some of the structural details of those buildings may be of interest. The Philadelphia building is approximately 140 ft. wide, 600 ft. long and 50 ft. high. Across one end and connecting to an adjoining building is a high-bay or transept spanned by seven of the new design welded roof trusses, each having a span of about 72 ft. The main wing of the building has a crane-bay over which are located 20 of the new trusses, each having a span of about 58 ft. There is also a gallery in an adjacent wing over which there are 20 welded trusses each of about 80 ft. span.

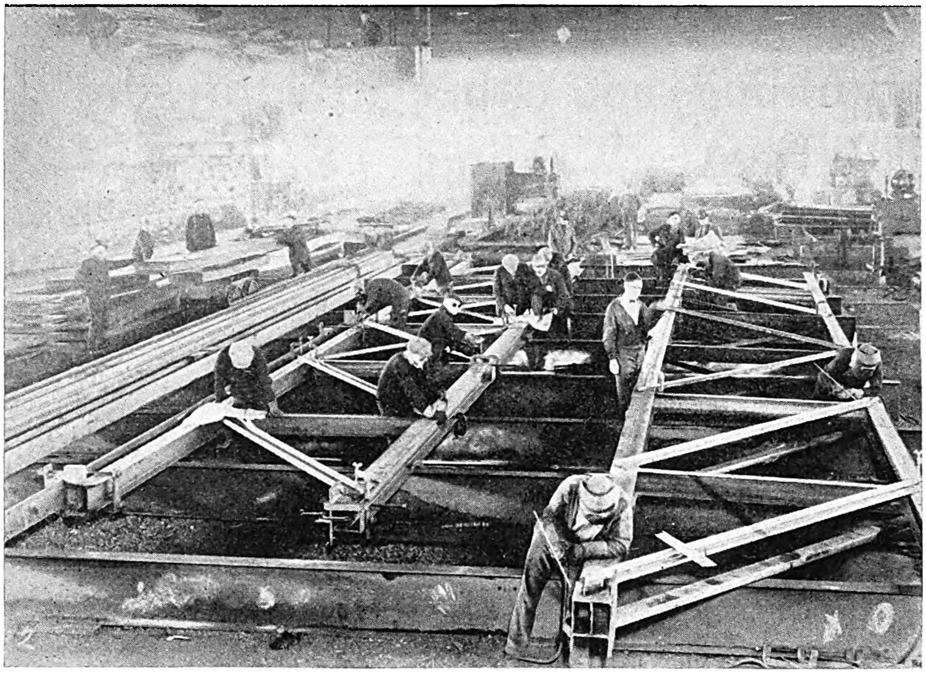
The new building at Bridgeport is a small, single-story structure, 64 ft. wide and 42 ft. long. It connects two existing buildings in which wire and cable are manufactured, thus making them into one. It required about 16 tons of steel. The Pittsfield building is a two-story structure of beam and column construction, about 40 ft. wide by 280 ft. long, and containing about 250 tons of steel. It is of steel frame, brick pilasters, base and cornice, and steel sash. Floors and roof are of concrete. It is used in the manufacture of molded products.

A further stimulus to the use of welding for building construction resulted from the design, during 1928, of a welded plate girder—an indispensible unit in many structural programs.** According to calculations, a saving of 16.2 per cent in the weight of the riveted girder can be effected by using electric arc welding. In the case of one welded

Welder at work on the welded factory building of the General Electric Company, Philadelphia, Penna.

General Electric Review, July, 1928.

**See *General Electric Review,* June, 1928; "A study in Welded Plate Girders," by Frank P. McKibben.



A roof truss being fabricated by welding in the Trenton shops of the American Bridge Company

girder, a swing of 27.1 per cent in steel weight resulted. It was pointed out, however, that this was not quite a fair comparison because the riveted girder has flange angles only, which extend the entire length, whereas in the welded girder weight is minimized by cutting off the flange plates to conform with the parabolic moment curve. On the other hand, it was shown that the riveted girder is a type in very common use and the comparison presented is justifiable.

Another and more equitable comparison showed that, when each of the two types had the outer flange plates cut to meet the moment requirements, a saving of 988 lb. or about 15 per cent was indicated for the welded girder as compared with the riveted form. A more precise comparison of weights would take cognizance of rivet heads and punchings from plates and angles on the one hand, with weights of welding electrodes consumed on the other.

One of the most interesting applications of welding to building construction during the past year was in the construction of an extension to the power house of the Haddon Hall and Chalfonte hotels of Atlantic City. This addition was erected, swiftly and noiselessly, without disturbing the guests of either hotel, or residents of the cottages in the neighborhood. The actual structural work was completed in a month's time, and the superstructure and finishing details were then added. The power house was scheduled for completion and use early this year.

The building is 134 ft. high and is one of the tallest welded steel frames in the world. Some of the steel columns supporting it and its contents are of the heaviest type of steel shapes used in building construction.

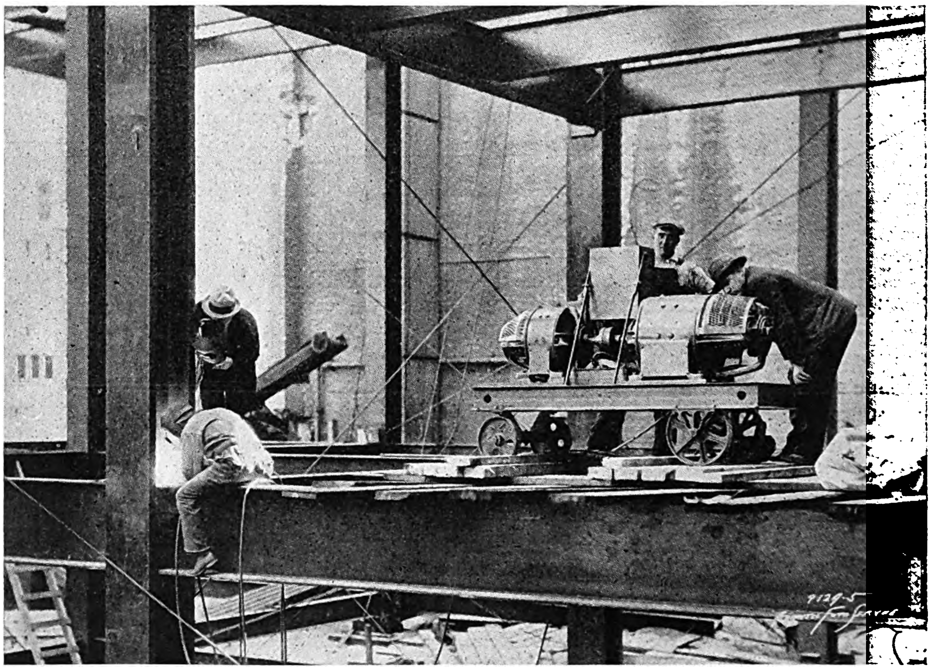
The hotels are owned by Leeds & Lippincott Company, the architects were Rankin & Kellogg of Philadelphia, the engineers were Carson & Carson of Philadelphia and the steel contractor was the Bethlehem Steel Company. Frank P. McKibben was retained as consulting engineer in connection with the design of the joints.

The erection was accomplished by the use of three arc welding sets, supplying three welding arcs used by three operators, with from 160 to 175 amp., direct current. Welding electrode having a diameter of 3/16 in. was used. In all cases a ⅜-in. filled weld was deposited at the joints, varying in length according to the application, stress, etc. It is estimated that, were the building riveted, it would have required the services of about three gangs of riveters, with three men in a gang.

The general dimensions are: 75 ft. by 89 ft., ground plan, and 134 ft. height above ground, including a pent house. The two hotels involved are situated one on each side of North Carolina Avenue, on the Boardwalk, in Atlantic City. The power house addition adjoins the Chalfonte but serves both. Pipe lines for heating and other purposes run underground across the street in a tunnel whose section is 7 ft. by 10 ft.

A total of six floors is involved, although the height is equivalent to that of a 12-story office building. In addition, there is a basement, and a pent house on the roof, the former housing piping and pumps, and the latter serving as a tank house. The engine room is located on the first floor; on the second floor are carpenter and machine shops, and ash handling equipment; the third floor is devoted to the boiler room; the fourth houses coal bunkers and ice machinery; the laundry is on the fifth floor, and bed rooms for employees are located on the sixth floor.

The framework is of beam, girder and column construction — the so-called skelton type. All floors are of reinforced concrete, and the walls are chiefly of brick. Steel sash was used throughout. In all, a total of 551 tons of steel is involved. Bethlehem H columns were used throughout, and the Bethle-



Welding operator at work on the welded power house hem types of girders and beams were utilized. One of the columns is the largest H-section rolled by the Bethlehem Steel Company, being a 16-inch H weighing 427 lb. per ft.

The work was so arranged that the welding not only did not hinder the progress of construction, but followed it along. In connecting to the existing power house (to which this will be an addition), a great amount of shoring and cutting away of brick and concrete were eliminated by reason of the welding.

Another very interesting application was in the fabrication and erection of an 11-story addition to "The Homestead," Hot Springs, Va. This structure, fabricated by the American Bridge Company under the direction of its Chief Engineer, James H. Edwards, was erected between the two large wings of the hotel. If riveting had been used, there is little doubt but that many of the guests in the hotel would have been so disturbed and annoyed by the noise that they would have left, with consequent financial loss to the management.

A number of other interesting applications have been made of the new tool welding, for structural work. A foot bridge, 846 ft. long, was constructed entirely by welding at the Schenectady plant of the General Electric Company. This structure contains 105 tons of steel, has 20 spans and involves a large number of supporting towers and "bents."

An ornamental structural gate, presented to Bowdoin College, at Brunswick, Me., by the class of 1903, was welded by the Bath Welding Company of Bath, Me. A total of 6,000 lb. of wrought iron was required, all parts being bent and shaped in the shops of the welding company.

Four pile drivers, made by the Mississippi Valley Structural Steel Company of Melrose Park, Ill., for the Walsh & Masterson Company of Chicago, were constructed recently by welding. As these machines are subject to very heavy duty, involving terrific vibration, night and day, strength was of particular importance. Now, after months of service, they are as rigid as when first built.

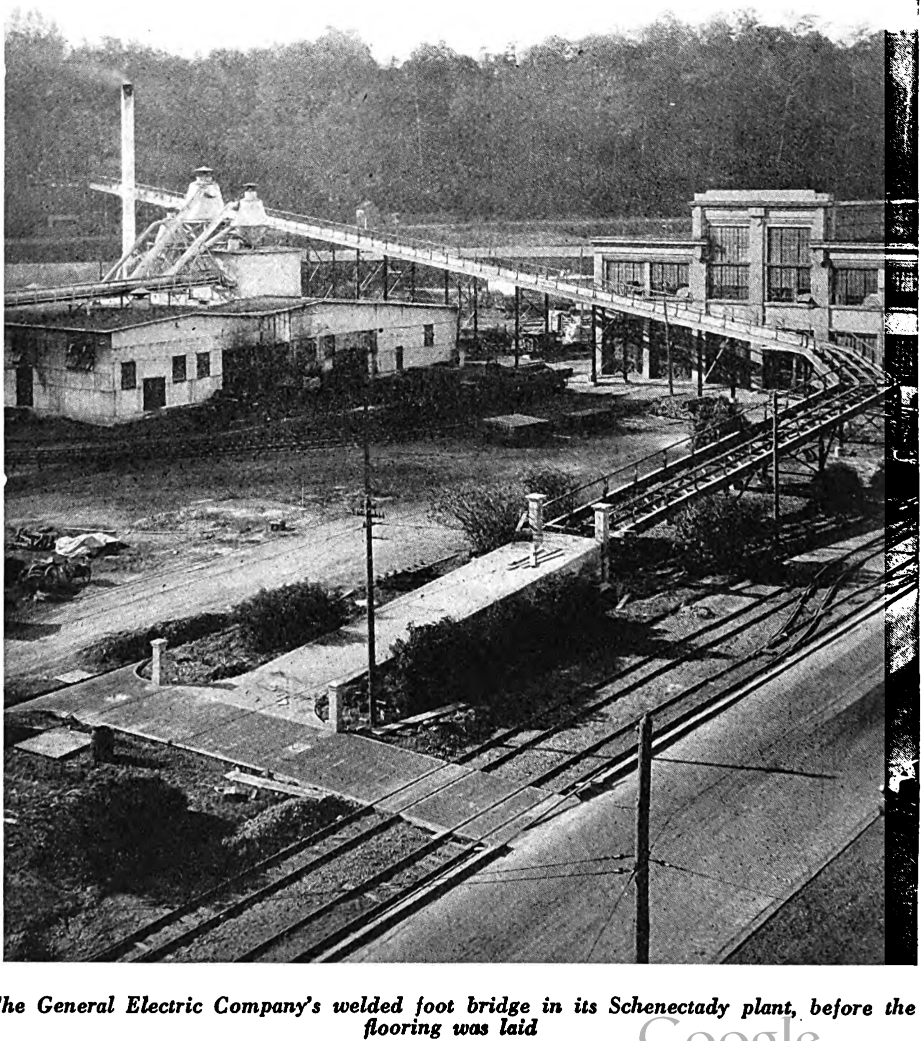
Each pile driver is 81 ft. high and operates a steam hammer weighing 10,300 lb. At no sacrifice of strength, a 15 per cent saving in material was effected in the construction of each. One of the principal advantages of the lighter weight thus secured was the greater ease with which the machines could be moved from place to place.

Finally, as an example of what welding plus a little ingenuity can do, there is a 40-car welded garage erected from second-hand material by the Dallas Power & Light Company of Texas for the protection of employees' automobiles. The total cost was but 25 per cent of the lowest contract price for an equivalent structure. A single portable welding set did the work.

The garage is made of steel angle-iron framework, covered with corrugated galvanized iron. There are two units, each 16 by 140 ft., divided into ten spans each 14 ft. wide, and each unit being capable of covering 20 cars. The units face each other with a 22-ft. driveway between.

The great saving in this instance was effected because the steel used was salvaged from the framework of an outdoor switching structure which became obsolete with the addition of generating equipment to the power plant. The varying lengths of the steel members removed, together with the numerous holes already punched for the switching structure (which would have interfered with the punching of new holes to fit the garage structure) would have made it necessary to splice or junk the greater part of the steel if a type of construction other than welding had been used. As the company possessed a portable welding set, it was decided to fabricate the structure by welding.

The roof trusses are of the simple Fink type. The upper and lower chords are made of two 2-in. by 2-in. angles welded together, back to back. The other members of the trusses are 1-in. by 1-in. angles. All members are connected together with ⅜-in. plate and the trusses themselves are connected to the columns in a similar manner. The span of each truss is 16 ft. and the height at the center is 3 ft. 2 in. The purlins for the roof are 2-in. angles, with one edge welded to the truss. This leaves a flat side of the angle for the corrugated iron roof to rest on. The columns are made of 5-in. angles. These columns are welded to the plate at each end of the truss. The back columns are braced to purlins and to trusses with short knee braces. The columns are spaced on 14-ft. centers. The girt angles to which the corrugated iron siding is fastened are welded on, the same as the purlins. The columns are bolted to the foundations through angle clips welded to the bases of the columns, and these are the only bolts in the entire structure. The roof and walls are made of 29 gage corrugated galvanized iron roofing fastened on with 6-in. roofing nails.



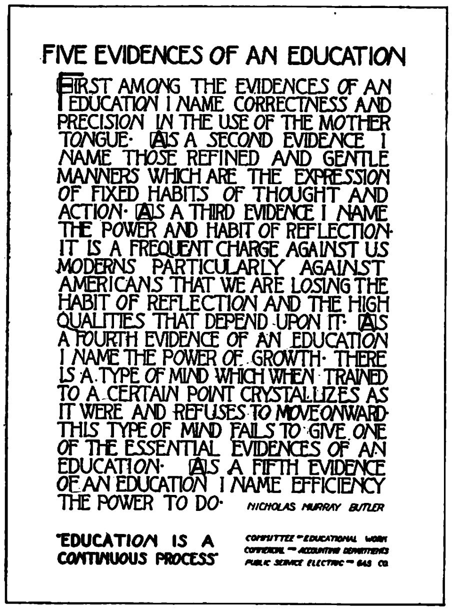
The General Electric Company's welded foot bridge in its Schenectady plant, before the flooring was laid

Home Study for Employees Encouraged by Power Companies

By JOHN J. MCIVER

WHILE many great industrial and commercial organizations of the country have acknowledged their active cooperation in the promotion of practical home study courses, which will prove mutually advantageous for the promotion of employees and the greater expansion of the organizations' business activities, no branch of industry can show greater progress in the promotion of this program than the electric light and power companies, along with their allied corporations, the traction and electrical companies, according to statistics provided by the National Home Study Council, Washington, D. C.

IN fact, a glance at the tabloid list. which follows, identifying but a few of the many organizations supporting or encouraging practical home study projects, offers mute acknowledgment and indorsement of the values of home study as a business and industrial asset. Culled from the roster of organizations supporting home study are: the Westinghouse Electric & Manufacturing Company, Pittsburgh; American Gas & Electric Company, New York; Alabama Power Company, Birmingham; Potomac Electric Power Company, Washington, D. C.; Northern States Power Company, Minneapolis; Tennessee Power Company, Chattanooga; Utah Power & Light Company, Salt Lake City; Empire Gas & Electric Company, Geneva, N. Y.; Commonwealth Electric Company, Summit, N. J.; Coast Counties Gas & Electric Companies, Santa Cruz, Cal.; Potomac Edison Company, Hagerstown, Md.; Texas Power & Light Company, Dallas; Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va.; Washington Railway & Electric Company, Washington, D. C.; Capital Traction Company, Washington, D. C.; Kansas Gas & Electric Company, Wichita; Kentucky Traction & Terminal Company, Lexington; El Paso Electric Railway Company, El Paso; New York State Railways Company, etc.



FIVE EVIDENCES OF AN EDUCATION

FIRST AMONG THE EVIDENCES OF AN EDUCATION I NAME CORRECTNESS AND PRECISION IN THE USE OF THE MOTHER TONGUE· AS A SECOND EVIDENCE I NAME THOSE REFINED AND GENTLE MANNERS WHICH ARE THE EXPRESSION OF FIXED HABITS OF THOUGHT AND ACTION· AS A THIRD EVIDENCE I NAME THE POWER AND HABIT OF REFLECTION· IT IS A FREQUENT CHARGE AGAINST US MODERNS PARTICULARLY AGAINST AMERICANS THAT WE ARE LOSING THE HABIT OF REFLECTION AND THE HIGH QUALITIES THAT DEPEND UPON IT· AS A FOURTH EVIDENCE OF AN EDUCATION I NAME THE POWER OF GROWTH· THERE IS A TYPE OF MIND WHICH WHEN TRAINED TO A CERTAIN POINT CRYSTALLIZES AS IT WERE AND REFUSES TO MOVE ONWARD· THIS TYPE OF MIND FAILS TO GIVE ONE OF THE ESSENTIAL EVIDENCES OF AN EDUCATION· AS A FIFTH EVIDENCE OF AN EDUCATION I NAME EFFICIENCY THE POWER TO DO·

NICHOLAS MURRAY BUTLER

"EDUCATION IS A CONTINUOUS PROCESS"

COMMITTEE — EDUCATIONAL WORK
COMMERCIAL — ACCOUNTING DEPARTMENTS
PUBLIC SERVICE ELECTRIC — GAS CO

This is a reproduction of one of a series of posters prepared by the Committee on Educational Work of the Public Service Electric and Gas Co. of New Jersey

What is the motive inspiring these great organizations to support and encourage continuous home study among their employees? According to expressions from many executives, support and encouragement of home study projects for employees is considered a vital necessity in the expansion plans of the organizations. They point out that industrial and commercial organizations, like armies, can expand only as much as the available force of trained executives, specialists or officers will permit, in compliance with sound procedure.

A STATEMENT made recently by Howard Duryea, assistant to the general manager of the Alabama Power Company, visualizes in part the attitude now held by many great industrial and commercial organizations. He said:

"Many of the employees of the Alabama Power Company and Dixie Construction Company are taking correspondence or home study courses, and this effect is of considerable assistance to them, as well as being a marked and vital advantage to the company. These men are scattered over practically the entire northern half of Alabama, and the Birmingham office, therefore, is compelled to keep in touch with them by means of their superiors, rather than by direct contact.

"However, we find that our division managers, superintendents and foremen are all interested in the progress the field men are making in their home study pursuits. Hence, these officials follow the progress of each student closely, advising headquarters of the facts. Conscientious effort on the part of these men engaged in home study makes a good impression on any employee's superior and marks him for advance ahead of one who shows no desire to study. This is true even though both are equally capable in their routine work and display about the same degree of intelligence.

"THE Alabama Power Company also conducts its own vocational schools for the instruction of those directly employed at the plants and in the offices. Courses sponsored by an approved correspondence school are given in these company-owned schools. However, many of these employees, after completing their course of instruction in these classes then enroll with the correspondence school for higher courses.

"In compliance with the company's policy, I am not permitted to mention names in this case, but I can state that some of our best employees, now holding high and responsible positions with the Alabama Power Company, have been promoted solely on merit of their qualifications, which was made possible through their conscientious devotion to home study instruction."

Moreover, the attitude of the Alabama Power Company revealed by Mr. Duryea's statement is echoed by Charles M. Schwab, who summarized the outlook with these words:

"Two great problems confront the industrial and commercial circles of the nation. One is the necessity of reducing costs; the other is the importance of training and developing men."

In its encouragement and support of practical home study courses, as given by approved correspondence schools, the electric power and allied industries are following a trail blazed by great organizations in other fields of the country's industrial and commercial activities. Realizing that this is an age of specialists, these organizations are taking practical steps to create an adequate reserve force of trained employees and specialists, who may be ready for the opportunities that await them as expansion plans unfold.

The importance of an adequate reserve force of trained executives and specialists, which it believes is essential for the continuance of national prosperity, is set forth by the National Industrial Conference Board as follows:

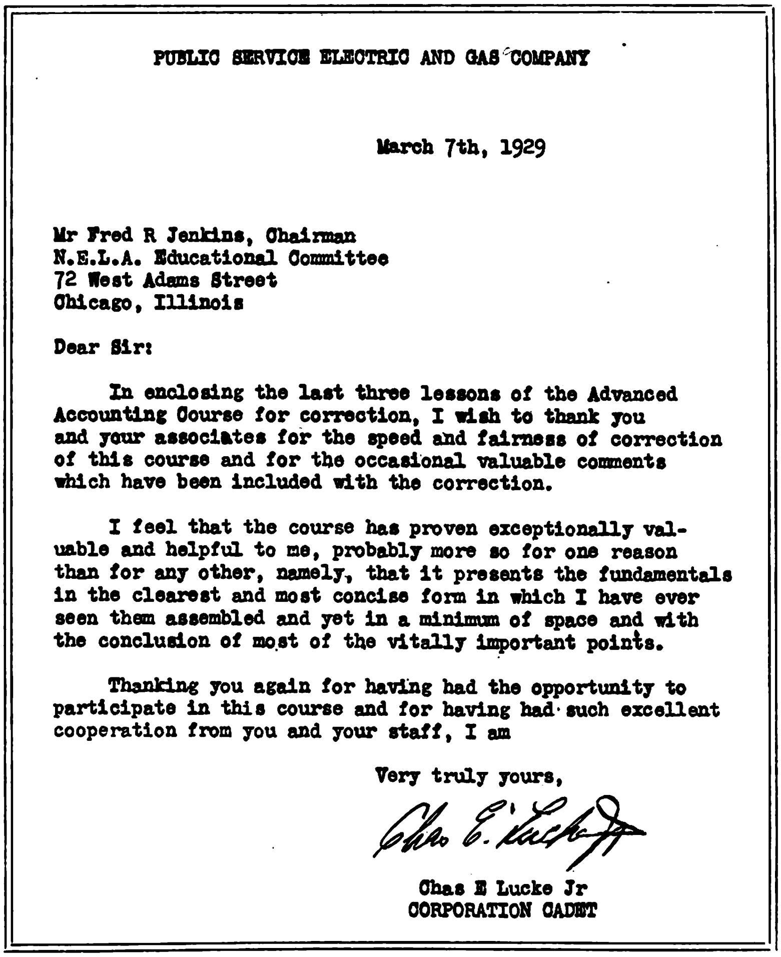
"IF the proportion of gainfully employed persons in the United States continues to increase at the same rate apparent since 1920, they will total 50,300,000 in 1930, and the administrators, supervisors and technical experts needed in American industry will number 1,900,000, an increase of approximately 400,000 over 1920. This is in addition to the replacements required during the ten-year period. Incidentally, of the 41,600,000 persons gainfully employed in the United States in 1920, less than 4 per cent planned activities and directed the energies of the whole working force.

"Hence, less competition and greater opportunity is offered in the specialized field of employment. This is due to the internal changes in industry, such as its magnitude and its multiplying complexity. Furthermore, in the past twenty-five years there has been a marked increase in the use of power and labor-saving devices and in the elaboration of methods of control in production and distribution. Each new division of labor thus creates another demand for those able to direct men and operations.

"Based on expert opinion expressed by acknowledged authorities in commercial and industrial circles, the normal progress of industrial methods and new competitive conditions will require a more rapid increase than ever before noted in the quality and number of trained executives and specialists."

THE STUDYING THAT REALLY COUNTS

In the words of Henry L. Doherty, "It's the studying you do after your school days that really counts. Otherwise you know only that which everyone else knows."



PUBLIC SERVICE ELECTRIC AND GAS COMPANY

March 7th, 1929

Mr Fred R Jenkins, Chairman
N.E.L.A. Educational Committee
72 West Adams Street
Chicago, Illinois

Dear Sir:

In enclosing the last three lessons of the Advanced Accounting Course for correction, I wish to thank you and your associates for the speed and fairness of correction of this course and for the occasional valuable comments which have been included with the correction.

I feel that the course has proven exceptionally valuable and helpful to me, probably more so for one reason than for any other, namely, that it presents the fundamentals in the clearest and most concise form in which I have ever seen them assembled and yet in a minimum of space and with the conclusion of most of the vitally important points.

Thanking you again for having had the opportunity to participate in this course and for having had such excellent cooperation from you and your staff, I am

Very truly yours,

Chas E. Lucke Jr

Chas E Lucke Jr
CORPORATION CADET

THE NATIONAL ELECTRIC LIGHT ASSOCIATION offers at a nominal price a number of educational courses available to all utility company employes. These courses, with their costs, are as follows:

Elementary Course in Bookkeeping and Accounting

This course is designed to give the student a proper understanding of the fundamentals on which is based the accounting theory and practice of all business. The cost is $16.00.

Advanced Course in Electrical Utility Accounting

This course was established in response to a very evident demand for standard instruction in accounting for the electrical industry. To get the best results from it, the student should have a thorough fundamental training in bookkeeping; and those desiring to take this course should give satisfactory evidence of having received instruction equivalent to the elementary course offered by the association. The cost is $85.00.

Course in Practical Electricity

This course has been specially prepared for central station men not having a technical education. It is written in plain English, without higher mathematics and without unnecessary technical expressions. It takes up in ten lessons the theory of electricity, beginning with magnetism, and continuing on through a discussion of D. C. circuits, generators and motors, to the fundamental principles of A. C. generation, transformation, distribution, and utilization. The cost is $12.00.

Commercial Courses

The three commercial courses: **Lighting Sales, Merchandise Sales, Power Sales,** are divided into two parts—the first part of five lessons being common to all three. This part discusses salesmanship, public relations, elements of electricity, principles of rates, and wiring for light and power. The second part varies, so that the salesman in any of the three branches may take only that course applicable to the specialized knowledge demanded in his work.

The **Lighting Sales Course** takes up principles of illumination, and residence, commercial, industrial and outdoor lighting, in seven lessons.

The **Merchandise Sales Course** discusses advertising, merchandising, heating and household appliances, industrial applications and selling campaigns, in five lessons.

The **Power Sales Course** studies motors and their applications, steam, oil and gas engines, isolated power plants and industrial heating. The cost of the four Commercial Courses is $12.00 each.

Course for Electrical Metermen

The Course for Electrical Metermen is divided into three parts: Elementary theory, direct current meters and single-phase alternating current meters. The student may combine part two or part three with part one for $12.00, or take all three parts for $18.00.

Further information regarding these courses may be secured by writing to

FRED R. JENKINS, *Chairman,* N. E. L. A. Educational Committee, 72 West Adams St., Chicago, Ill.

National Food Preservation Program Begins

Local Activities Will Thoroughly Cover Country During Month of September

ACTIVITY in the National Food Preservation Program opened on a nation-wide scale September 1, and the rapidity with which organizational work has gone forward at the time this article is written promises that local activities will thoroughly cover the country during Food Preservation Month.

The local councils which have completely organized, or which have shown their intention of actively cooperating with the National Program by requisitioning tie-up materials prior to August 1, are situated in all parts of the country, and practically every one of the forty-eight States. The location of these cities is shown on the map printed below.

Several hundred more will be in action than are indicated on the map. Most of the larger cities are in this classification, since their greater size made it imperative that the local Councils take more time in the organizing steps and in preliminary planning to assure the maximum of correlation of all the organizations intending to participate. The New York Council has just completed its organization plans. Extensive publicity includes a $100,000 appropriation for billboard and newspaper advertising in addition to other spectacular features.

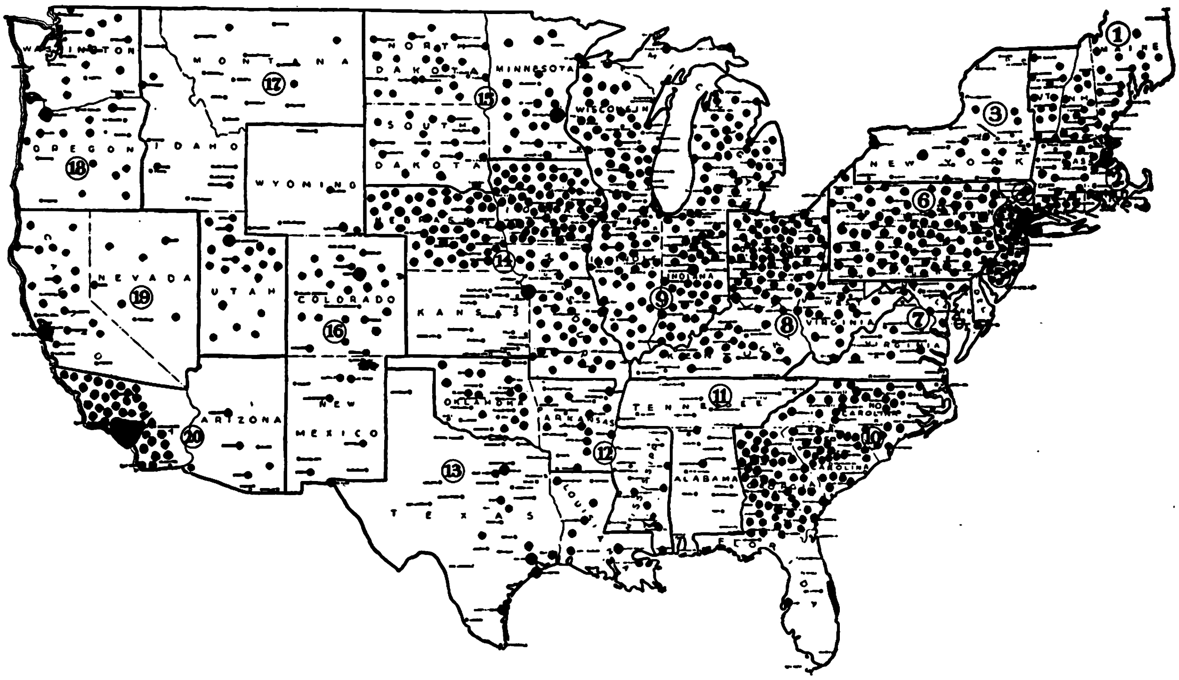
An indication of the vigor with which participation has been planned, is presented by the amount of the various tie-up materials ordered from National Advertising Headquarters. Nearly 5,000,000 milk bottle jackets, 40,000 truck banners, 6,000,000 booklets for the information of competitors in the National Idea Contest for $25,000.00 in prizes, 600,000 thermometers, and proportionately large amounts of other materials had been requisitioned up to the last week in July.

With such intensive programs for local activity linked with the National Program, and its dominant space in the national magazines, an impressive effect on the consciousness of the public in regard to the necessity of proper modern refrigeration should result. The magazine advertising is already under way, and entries in the National Idea Contest are pouring into Headquarters. Other activities in this nation-wide movement are going ahead at an equally rapid pace.

Local success of the movement, however, is dependent largely upon local cooperation by all the agencies concerned, particularly the interest and leadership of the power company in stimulating action among those engaged in any business concerned with the preservation of the public health, and the nation's food supply.

An example of the cooperation being obtained from the leaders in the national movement is given in the announcement by three of the members of the Publicity Committee, representing the General Electric Company, Kelvinator Corporation and Frigidaire Corporation, that their firms, which are national radio advertisers, will devote at least part of their time on the air during September, to broadcasting National Food Preservation Program propaganda.

Endorsement of the Program by the California Fruit Growers Exchange, recently received in a letter at National Headquarters, opens up a new channel for the active promotion of the program's work. The Exchange advised Headquarters that it would aid the work of the Program in every practicable way, and that it would tell all distributors of the famous "Sunkist" products of its action, and call upon



STATUS OF ORGANIZATION WORK ON THE NATIONAL FOOD PRESERVATION PROGRAM AS OF AUGUST 1st

Dots show the cities in which active work has been initiated, councils completely organized, or tie-up materials requisitioned, as reported to National Headquarters at that time. Indications point to local participation in the Program by organizations in more than a thousand cities and towns.

them to cooperate in furthering local programs in their communities.

Their letter says:

"Your letter to Mr. C. C. Teague, President of this organization, has been referred to this department. We were interested in going over the plans for National Food Preservation Month and the explanation of your program. We are pleased to endorse and to commend it as an excellent piece of educational work.

"We feel that in the educational type of advertising used by this organization, we are contributing something to the cause of better health. We are, therefore, glad to be associated with the other national organizations participating in your program and to lend our endorsement to this new educational job."

With support of this character coming from not only this organization, but also from the Federation of Women's Clubs, Bureau of Home Economics, Department of Agriculture, National Retail Furniture Association, American Gas Association and numerous electric groups, together with the National Electric Light Association, it is confidently expected that National Food Preservation Month, just now being ushered in, will prove one of the most successful undertakings in public education in the history of modern society.

Government Bodies Report That Danger in Mechanical Refrigeration Is Negligible

AFTER a detailed study of mechanical refrigeration, three government bodies have issued a joint statement, declaring that serious accidents from such devices are infrequent and that no further investigation was necessary. The conference was called by Dr. Hugh S. Cummings, Surgeon-General of the Public Health Service, and was attended by representatives of that agency, the Bureau of Standards and the Bureau of Mines. In the formal statement, issued to prevent "undue anxiety," the agencies agreed that the Bureau of Mines, which has been conducting investigations, should continue its work.

The full text of the statement follows:

"Several deaths which have occurred recently in Chicago have been attributed to poisoning by methyl chloride which leaked from refrigerating systems. These have received wide publicity, and have caused apprehension, even among the users of refrigerating equipment entirely unlike that to which the fatalities have been attributed. It is the purpose of this statement, authorized jointly by the Public Health Service, the Bureau of Standards, and the Bureau of Mines, to state the essential facts regarding this danger and to relieve any undue anxiety in the minds of those possessing household refrigerating systems.

"All refrigerating systems in practical use depend for their operation upon the repeated gasification and condensation (sometimes by dissolving or 'absorbing' in another substance) of a material which is technically called a 'refrigerant.' In most cases the refrigerant is confined under pressure in the refrigerating machine and, if it escapes from the system, becomes a gas which mixes with the surrounding air.

"For many years the gas ammonia was almost the only refrigerant used. For technical reasons other refrigerants have more recently been introduced and are now extensively employed. Sulphur dioxide and methyl chloride are the most important of these.

"None of the three refrigerants mentioned —ammonia, sulphur dioxide or methyl chloride—can be breathed with impunity, but none are violent poisons when breathed for a short time in low concentrations. If the same amount of the three substances is considered, methyl chloride is the least poisonous of the three; but because their physiological effects are quite different it is hard to make a quantitative comparison.

"Sulphur dioxide and ammonia both have strong odors which are easily recognized and are so irritating that no one is likely to breathe much of them if escape is possible. Methyl chloride has a slight and rather pleasant odor, which probably would not awaken a sleeping person and might not be recognized by one who was awake. To this fact is to be attributed any greater hazard from methyl chloride than from other commonly used refrigerants.

"Most of the trouble attributed to methyl chloride has occurred in connection with multiple refrigerating systems installed in apartment houses in which a single compressor delivers the refrigerant through tubes to the refrigerators in the several apartments. A large majority of the individual household refrigerators of the motor-driven (electric) type now in use employ sulphur dioxide as the refrigerant. Nearly all, if not all, of the domestic refrigerators, the operation of which depends upon supplying heat instead of mechanical compression, use ammonia. This class includes a few electric refrigerators of unusual type and all of the gas-fired refrigerators. The escape of the refrigerant from the more commonly used household refrigerating systems would, therefore, be at once made evident by its odor.

"Newspaper headlines and statements to the effect that the fatalities in Chicago were caused by 'gas refrigeration' without doubt had reference only to the fact that refrigerants are gases. 'Illuminating' or fuel gas was in no way involved.

"The high volatility of all practical refrigerants makes it quite improbable that enough of these substances could be retained in food stored in the refrigerator to be harmful.

"Methods for eliminating the danger from methyl chloride systems are being studied. It would be premature to say whether the end will be accomplished by replacing methyl chloride entirely by other refrigerants, by adding something which will give the refrigerant a sufficiently powerful odor, or by so improving the mechanical construction of the equipment that leakage will not occur where the gas might enter rooms in which people live.

"It should be recognized that the number of serious accidents from household refrigerating systems has been small in comparison with the number of such systems in use, and improvements may be expected which will much reduce the small hazard that does exist."

Obituary

Armistead K. Baylor

ARMISTEAD K. BAYLOR, aged 61, General Electric commercial engineer and veteran of the electrical industry, died suddenly early on the morning of Aug. 1 at Ipswich, Mass., where he was summering. In 1891 Mr. Baylor went with the Thomson-Houston Electric Company at West Lynn, Mass., and moved to Schenectady, N. Y., in 1894 when the headquarters and main offices of the General Electric Company were established there. In 1896 he went abroad to become manager of the traction department of the British Thomson-Houston Company, becoming general sales manager there. After fourteen years he returned to this country to re-enter the General Electric organization, and for several years was in the commercial general department. Mr. Baylor was also vice-president, director and a member of the executive committee of the Edison Electric Appliance Company. In addition he served on the directorate of the Electric Vacuum Cleaner Company and the Contract Purchase Corporation.

Mr. Baylor was very active in Association work. He was also a member of the American Institute of Electrical Engineers and of the Institution of Electrical Engineers (Great Britain).

James T. Hutchings

JAMES T. HUTCHINGS, vice-president of The United Gas Improvement Company in charge of engineering development, died suddenly on Saturday, Aug. 17, at Ocean City, N. J. Heart disease was the cause.

Mr. Hutchings entered the employ of the U. G. I. Company in 1920 as assistant general manager. In August, 1921, he became general manager, and two years later was elected vice-president in charge of operations. In February, 1927, he became vice-president in charge of engineering development.

Born in Amherst, Mass., in 1869, a son of John F. and Clara (Dana) Hutchings, he attended Amherst public schools and was graduated from Massachusetts Agricultural College with the degree of Bachelor of Science in 1889. His first position after graduating was with the Thomson-Houston Electric Company, of Amherst, in which he remained about four months. In that same year he came to Philadelphia to accept a position as foreman of wiring with the Germantown Electric Company, and later became superintendent of the West End Electric Company, in which position he remained until that company and numerous other small companies in the city were consolidated into the Philadelphia Electric Company. From 1897 to 1904 he was employed by the latter company as assistant electrical engineer.

Then followed sixteen years with the Rochester Gas and Electric Corporation during which he held the positions of superintendent of the Electric Department, assistant manager, general manager and president. He capably filled the latter position for two years, until 1920, when he entered U. G. I. employ.

During the World War, Mr. Hutchings was chairman of the Manufacturers' Committee of the Rochester District, in charge of production, and was power expert for the Ordnance Department in charge of munitions production.

Mr. Hutchings was a member of the National Electric Light Association, American Gas Association, American Institute of Electrical Engineers, Engineers Clubs of Philadelphia and New York, the University Club of Philadelphia, and the Overbrook Golf Club.

Charles H. Ingalls

CHARLES H. INGALLS, for many years meter engineer of the Edison Electric Illuminating Company of Boston, Mass., and one of the most eminent specialists in this field in the utility industry, died suddenly on Aug. 4 at Rockport, Mass. Mr. Ingalls was born at Danvers, Mass., 56 years ago, was educated at the Massachusetts Institute of Technology and entered the employ of the Edison company in 1896, the year of his graduation. He was active for many years in the work of the N.E.L.A., and had held many responsible committee posts in connection with electrical measurement engineering. Under his direction were installed the extensive facilities for multiple testing of meters by automatic methods at the general service buildings of the Edison company which have attracted the admiration of meter specialists from all over the world.

Honor to the Faithful Employee

By B. C. FORBES

MANY people and many things have contributed to make America great. Nobody has contributed more than America's capable workers.

We delight to honor all kinds of people; but how often is adequate honor done to workmen deserving honor?

This neglect makes all the more interesting and worthy of note the signal tribute paid one faithful workman by one large corporation.

George B. Cortelyou, president of the Consolidated Gas Company of New York, has just had prepared a unique little volume, with the simple title, "John O'Connell." It is devoted entirely to a sketch of John O'Connell's career and a reproduction of a commemorative tablet which reads:

"In recognition of the unprecedented continuous service of seventy-two years at this plant of John O'Connell, General Foreman, who died on July 13, 1928, the Twenty-first street plant of the Consolidated Gas Company was by order of the executive committee on Tuesday, March 5, 1929, designated as the O'CONNELL PLANT."

How many workers not above the rank of foreman have had a big plant named after them?

In unveiling this tablet, President Cortelyou said:

"In affixing this commemorative tablet to the walls of the Twenty-first street plant—now known as the O'Connell plant—we are but giving effect to what was already as established fact; for whether so officially designated or not, this plant would always be associated with the name of John O'Connell. We cannot think of one without the other. His long life was spent here. Beginning as a lad of seventeen, he worked here for nearly three-quarters of a century, doing his duty well and faithfully all the time, and making a record of continuous active service that is unprecedented. All of his interests were centered in this neighborhood. Near here is the church in which he worshipped, and it is in this section that he spent so many of his spare hours in visiting and helping the poor, the sick and the needy. In his life, both inside and outside the plant, he exemplified those virtues which ennoble the individual and exalt the nation.

"Though he is gone from us, his character and example remain as an inspiration to those who follow after. We are proud to belong to an industry that produces such men as John O'Connell."

It may be complained that John had to wait until he was dead before his services were recognized. He didn't. Three years ago his company tendered him an anniversary dinner, "on the occasion of his completion of three-score-and-ten years of continuous employment." That function was graced by the attendance of many notables in the Consolidated Gas Company, from President Cortelyou down, as well as by a number of prominent citizens in various walks of life, some of them familiar with John O'Connell's daily benefactions conducted over a period of more than half a century.

These bits from the life history of John O'Connell reveal that a man does not have to possess riches to become a genuine philanthropist and that even the longest of working hours need not prevent one from finding the time to do good if his heart beats warmly:

"For many years he lived in a house owned by the company and located at the works, where he was on call at all hours of the day and night. Aside from his home, family and church ties, his life was centered in the works, and to do it he gave unreservedly the best that was in him.

"He never took a vacation or a Sunday off, and up to the time of his final illness he scarcely knew what it was to be sick. He seldom went out of the neighborhood, and then only for a few hours at a time.

"At a meeting of the directors on April 20, 1880, the president was directed to present to John O'Connell the sum of $50, as a token of their appreciation of his services on the occasion of the fire in the Scrubber House.

"For more than seventy years he never missed 6 o'clock Sunday morning mass. He held various offices in the St. Vincent de Paul Society, and was active in charitable work, spending most of the hours between supper and bedtime in visiting and relieving the sick and needy of the parish. He was a generous contributor to all the objects of the church and was a donor of several memorials. Practically every moment of his waking hours was filled with useful work.

"Thus, within the sphere which he marked out for himself, John O'Connell achieved a success and a distinction that will be remembered and cherished as long as the industry that he loved so well and served so faithfully endures."

May the telling of this story inspire other employers to pause and consider whether they have not in their employ some man or men justly entitled to more than ordinary recognition.

Papers Submitted in Prize Awards Contest Now Available to Members

THE BULLETIN publishes below and on the next page a partial list of papers entered in the 1928-1929 competition for the various prize awards offered annually under the auspices of the Association. Other papers were listed in the August issue of the BULLETIN.

The Association will be glad to loan any of the papers listed upon application to the Secretary, National Electric Light Association, 420 Lexington Avenue, New York, N. Y. Requests for loans of the papers will be filled in the order of receipt.

Active Meters in Vacant Premises

By R. F. BONSALL

Consolidated Gas, Electric Light and Power Company of Baltimore, Baltimore, Maryland

A SUGGESTION that meters be left alive and active when residential premises are vacated was the subject of a Service Suggestion published in January, 1926. Data were presented to show that the plan possessed advantages for the company as well as the customer. This idea was later placed in effect by several operating companies with gratifying results. Despite this success in changing company policies for the convenience of the user, many companies continue to follow the old policies and it is deemed desirable to present further information concerning the plan and the results to be obtained by its adoption.

The practice of leaving meters in place and connected when a customer moved was started in 1913 by one of the larger eastern companies. Based upon experience extending over a period of more than fifteen years the plan proved to be a decided factor in building public good-will. It also effected a considerable annual saving in operating expenses by the elimination of considerable costly physical effort expended in setting and removing meters.

A recent canvass was made of a group of representative companies to learn their present practice in the matter. A tabulation of their replies shows that the majority of the companies have adopted the plan of leaving the meter connected and ready for use by the incoming tenant. Eight companies reported that the meters were disconnected in some manner but not removed. Thus practically all of them have adopted the general practice of leaving the inactive meter on the premises, either as alive and ready for use or with the fuses removed and sealed but ready to be placed in service on short notice.

Several of the companies which report that their meters are disconnected, state that they leave them connected during moving seasons in order to facilitate the completion of service orders during these rush periods. This serves to emphasize the value of the plan and leads to the prediction that eventually these companies will make it their general practice to leave all inactive meters connected ready for immediate use when a new customer moves in.

The reports further indicate that the experience of companies which have adopted the plan has been very satisfactory. Several of them have stressed the improvement in better public relations that naturally results when the many thousands of customers who move into new homes each year find the electric service ready at the push of the nearest switch.

86054
SAFETY SWITCH ON
OFF

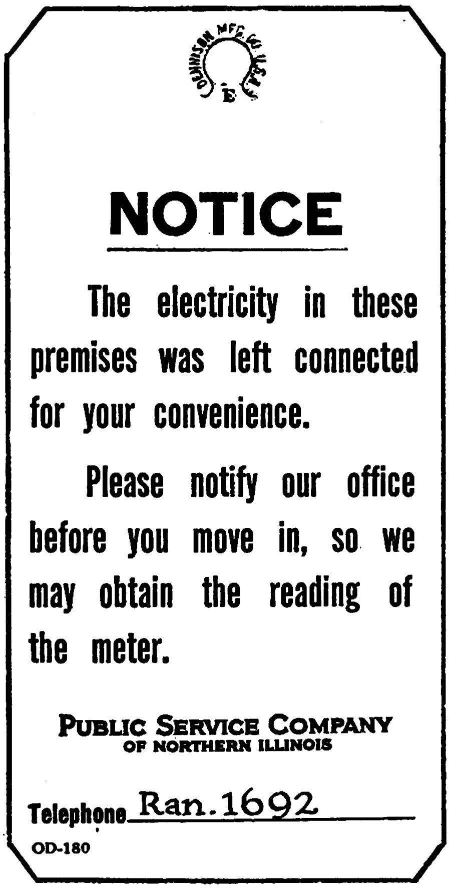
On the job ready to instantly serve the incoming tenant

Some persons contend that such a plan might be excellent for the combination gas and electric company since gas services must be locked off for safety reasons and when application is made for gas the electric application is obtained. It is therefore assumed that it might not benefit the company supplying electric service only.

An analysis of the replies shows that five of the larger utilities in the country furnishing electric service only have experienced very satisfactory results from the adoption of this plan. One of these companies reported, "It has cut down the cost of operation very materially and the losses incurred are so small that they are insignificant."

A comparison of the kilowatt hours charged off annually on these inactive meters, as related to the average monthly number of such meters left in service shows the extremely low loss of from 1.9 kilowatt hours to 2.6 kilowatt hours per year per inactive meter. As these low ratios of losses in inactive meters are found in the larger cities with their cosmopolitan population and more frequent changes in address, it is very probable that even lower loss will be experienced in smaller cities and towns.

The plan of leaving meters installed and connected can be very readily tested for limited periods where there is doubt as to its advantages. It will not in-



NOTICE

The electricity in these premises was left connected for your convenience.

Please notify our office before you move in, so we may obtain the reading of the meter.

Typical notice used in connection with the plan

crease the cost of handling service termination orders but will, in fact, lessen it because of the time saved. The only risk attached to a trial of the method is the possibility of loss through unauthorized use and which can be determined monthly. Experience has shown this to be small enough to disregard.

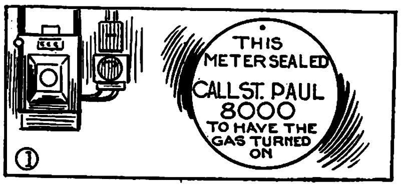
The plan of leaving the meters alive is, briefly, as follows:

When a customer's turn-off order is worked, the meter index is taken to close the account of that customer and the meter is left in service ready for the incoming tenant. A card notice is usually attached to the meter or to a prominent fixture in the house with the information that the electricity is left turned on for the convenience of the incoming tenant. The new customer is requested to notify the company of the date of occupancy so that the name may be entered on the company records. In the majority of cases this causes the desired information to be telephoned in.

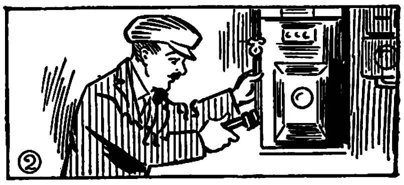
The various companies have adopted different periods for these meters to remain in service as "inactive" meters. Some decide to remove them after a period of six months, others at different intervals ranging up to two years. During this "inactive" period the meter is read each month on the regular call of the meter reader. If a small consumption is found registered, it is the usual practice to charge this off if the premises are still vacant. If there is a recurrence of such use not accounted for, the meter reader notifies the company of consumption on inactive meter and the meter is then ordered removed. If a new tenant is found living on the premises on one of the meter reader's monthly calls, and the meter sheets show that the customer has not applied for service, the name and any other information desired are obtained and sent to the company office. Based on this notice of use, a service request or an application is obtained and the new tenant is charged from the last index taken while premises were vacant, except as discussion with the tenant shows that he is not responsible for the entire use recorded. As a rule very little difficulty is found in having the new customer agree to pay for the said use of service. Most companies have adopted the broad policy that where there is argument concerning such use it is good policy to take the new customer's word and settle the case on a liberal basis. With monthly readings on each meter the losses are naturally quite small.

Our study of present practice of representative companies clearly shows a definite trend in the direction of leaving meters alive when the premises are vacated. Companies are urged to consider it as a means of avoiding delay in giving service and in effecting better relations with our customers. The plan helps create a good first impression which goes far toward gaining the everlasting good-will of new customers.

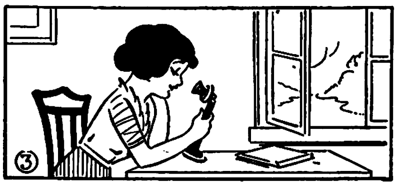
Illustrated story of the plan in operation in a Combined Gas and Electric Company



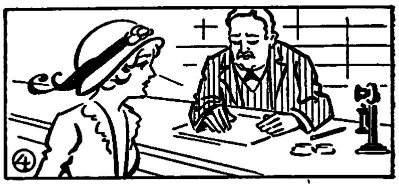
In Baltimore—when home is vacated, gas meter is turned off and tagged. Electric service is always available.



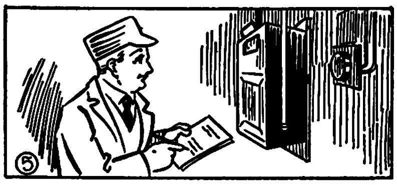
In may other cities—both gas and electric service is discontinued. Meters are taken from home in some cities.



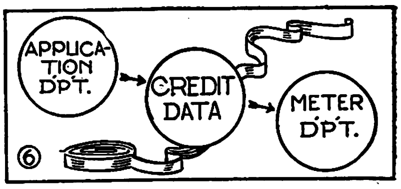
In Baltimore—a telephone call is all that is necessary to have gas service in new home. Electric service is always available.



In many other cities—it is necessary to make personal application before one secures gas or electric service.

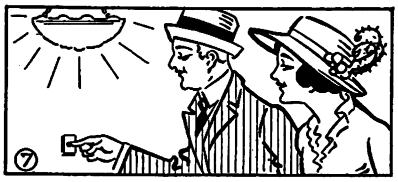


In Baltimore—man reads gas and electric meters—turns on gas. Electric service is always available.

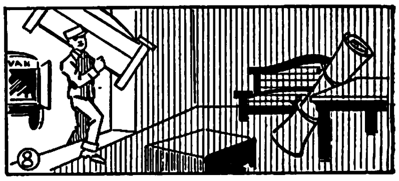


APPLICATION DPT.
CREDIT DATA
METER DPT.
⑥

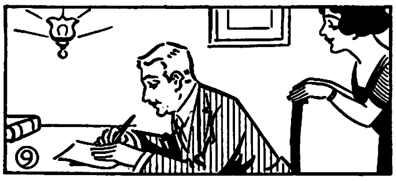
In many other cities—time is lost while application is going through various departments, resulting in delayed service.



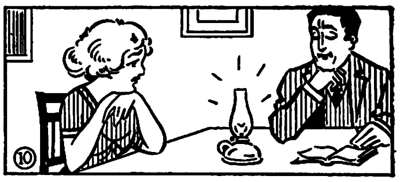
In Baltimore—new tenant moves into new home; gas and electric service facilitates moving—customers pleased with service.



In many other cities—new tenant moves into dark house while application for service is held up through red tape.



In Baltimore—customers sometimes write or call at office to express appreciation of Company's handling of requests for service.



In many other cities—red tape results in dissatisfaction on the part of customers, waiting for illuminating service.

Electrical Research Statistics

September, 1929

Issued Monthly by Statistical Research Department of the National Electric Light Association
420 Lexington Ave., New York, N. Y.

H. A. Snow, *Chairman, Statistics Committee, Accounting National Section*
Wm. M. Carpenter, *Economist*
H. S. Bennion, *Director of Engineering, N. E. L. A.*
Merle Rainey, *Statistician*

The National Electric Light Association, a voluntary organization of companies and individuals affiliated with or interested in the electric light and power industry, organized to advance the art and science of the production, distribution, and use of electrical energy for public service.

The Association maintains a Statistical Research organization which collects, interprets, and makes available basic statistical information on the electric light and power industry. The publications and services of this department are available to all those interested, on request.

Current Statistics of the Electric Light and Power Industry

(As of June 30, 1929)

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	MAY			JUNE

**As reported by 197 companies only, included in figures below.

Basic Information on the Electric Light and Power Industry

As of June 30, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the Bulletin.

1. Value of plant and equipment (estimated)	$10,300,000,000
2. Total generating capacity in kw	
Steam	data being revised
Waterpower	data being revised
Internal combustion	data being revised
3. Total number of customers served*	23,618,000
Farm customers (as reported by 190 companies only)***	336,000
Domestic customers	19,430,000
Commercial customers	4,157,000
4. Population in electrically lighted homes (Electrical World)	82,500,000
5. Percentage of homes which are served with electricity	67
6. Miles of transmission lines (11,000 volts and above) (circuit miles)	150,000**

* Subject to slight further revision. ** As of January 1st. *** Included below.

Summary of the Operations of the Electric Light and Power Industry During the First Half of 1929

THE extraordinary activity which has characterized manufacturing operations since January has been reflected in a remarkable increase in the output of electric energy by the light and power enterprises of the United States, the Statistical Research Department of the National Electric Light Association reports in a summary of electric service for the first half of 1929.

During the six months ending June 30, the total sales of large industrial power were 21,898,000,000 kilowatt-hours, an increase of more than 14 per cent over the corresponding period last year. This is directly in line with the figures of the Electrical Index of Industry and Trade, shown on the adjoining page, which gives an average condition of business activity of practically ten per cent above "normal," as compared with only five per cent above "normal" during the first six months of 1928, which degree of activity is substantiated by the various standard indexes prepared by other agencies.

Large Increase in Domestic Service

Equally striking is the large increase in the use of domestic service. For the first six months of the year, the total sales of electricity for lighting, cooking and appliances in the 19,400,000 electrified homes of the nation were 4,981,000,000 kilowatt-hours, an increase of 670,000,000 kilowatt-hours (or nearly 16 per cent) over the corresponding period of 1928. While part of this increase is due to the addition of new customers to the companies' lines, the larger part has been the result of the use of more kilowatt-hours in the individual home. At the end of December, the annual use of current by the average residential consumer was 459 kilowatt-hours. At the end of last June this figure had risen to 478 kilowatt-hours—an increase of more than four per cent. At the same time, however, this increase in use was accompanied by a decrease in the average rate, which declined by 15/100 of a cent per kilowatt-hour, or by nearly 2½ per cent, leaving the annual revenue *per consumer* substantially unchanged.

While the average use per consumer (with the exception of transportation, where the increase in steam-railroad electrification has almost been offset by the decline in the requirements of street railways) has thus shown a remarkable growth, the *number of new consumers* has, however, decreased very significally. This is, in part, the result of the fact that the aggregate of unwired houses in urban communities has rapidly diminished and, in part, the result of a very pronounced slump in residential construction throughout the United States. (See note on adjoining table of homes receiving electric service).

More Sales at Lower Rates

The tabulation of six months' operation shows that revenues have not kept pace with the increase in sales. Whereas the energy sold to consumers increased by 13½ per cent, the revenues which these consumers paid increased by only 8½ per cent. This gain in revenues is substantially the same in amount (and slightly less in percentage) as has prevailed during the past three years—in spite of the great spurt in industrial business and in the use of electricity in homes. It emphasizes once more the continuation of the electric light and power industry's general policy of passing on to the consumer the benefits of improved engineering and management. It nevertheless raises a question as to the further gain in gross revenues if, perchance, the present state of industrial activity should descend from its unusually high level and approach the figures which long-time trends in the various lines of industry and trade have approximated as "normal." For this reason, prophesy at this time as to the results for the entire year—alluring as such an effort may be—cannot seriously be undertaken.

Electric Light and Power Industry—Six Months' Summary

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 86 per cent of the industry.

	1929	1928	Percent Increase
DURING SIX MONTHS ENDING JUNE 30th			
*Kw-hr generated (net)	44,401,701,000	39,266,275,000	+13.1
Add—energy imported from Canada and purchased from outside electric light and power industry	1,083,883,000	1,262,741,000	—14.1
Less—energy used in electric and other departments	1,270,000,000	1,339,000,000	— 5.1
Total energy for distribution (kw-hr)	44,215,584,000	39,190,016,000	+12.8
Sales of energy in kw-hr for:			
Farm service (not involving irrigation)**			
Farm service (involving irrigation)**			
Domestic service	4,980,784,000	4,310,977,000	+15.5
Commercial service:			
Small light and power	6,508,003,000	5,682,326,000	+14.5
Large light and power	21,897,996,000	19,124,724,000	+14.5
Railways and railroads (motive power)	2,775,140,000	2,755,856,000	+ 0.7
Other sales to ultimate consumers	1,066,661,000	955,134,000	+11.7
Total sales to ultimate consumers (kw-hr)	37,228,584,000	32,829,016,000	+13.4
Total revenue	$1,027,251,000	$ 945,831,000	+ 8.6
Revenue from sales for resale and miscellaneous (included above)	$56,855,000	$53,060,000	+ 7.2

---

**As reported by 197 companies only, included in figures below.

Sixty-seven Per Cent of the Nation's Homes Now Use Electric Service

An analysis just completed by the association shows that at the end of June 19,430,000, or 67 per cent of the homes in the United States, were wired and received electric service daily. During 1928 more than one million domestic consumers were added to the lines of the light and power companies, which, added to the number of homes receiving electric service for the first time during the previous seven years, means that from January 1, 1920, to December 31, 1928, no less than 9,647,000 American homes were electrified. In certain States, such as New Jersey, New York and California, practically all homes are wired.

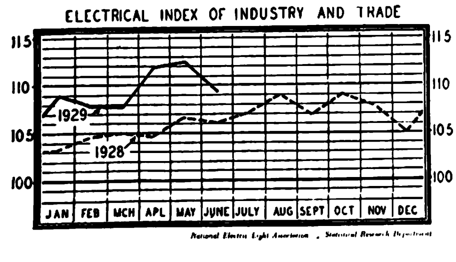
As compared with the first of the year, several of the States (noted as (a) in the table) show actual declines or else gains which appear to be unusual. This is largely due to seasonal characteristics. Many of the meters are temporarily in service in summer homes and, *per contra,* are out of service in winter residences. For this reason, the increase of only 360,000 during the first six months cannot be multiplied by two to give the probable annual gain in domestic customers. At the same time it compares with a figure of 532,000 for the corresponding period of last year, and so emphasizes the degree to which the diffusion of electric service throughout the country has been accomplished.

N. E. L. A. Index of Industry and Trade

	1927	1928	1929
January	104.9	103.2	109.0
February	103.8	104.7	107.9
March	106.9	105.0	107.9
April	106.8	104.6	112.0
May	106.3	106.6	112.5†
June	106.1	106.0	9.7*
July	104.8	107.1	
August	104.9	108.9	
September	104.8	106.8	
October	102.6	109.0	
November	102.9	107.8	
December	103.1	105.0	

*Subject to revision. †Revised.

Some irregularity in production and in general business is shown by the statistics of the output of the country's electric light and power plants, as reported for June by the United States Geological Survey.



National Electric Light Association . Statistical Research Department

Number of Homes Which Are Served with Electricity by the Electric Light and Power Industry

(Adjusted to latest census figures and determined from monthly reports to the N. E. L. A. from 400 Utility Companies. which serve 80 per cent of all electric consumers in the U. S. From these comprehensive data, the Statistical Research Department has extended calculations to give the complete information both for the entire U. S. and for the individual States.)

	Total Number of All Homes	Number of Meters in Service on Domestic Consumers' Premises			Ratio: Meters to Homes June 30 1928
		On Dec. 31, 1927	On Dec. 31, 1928	On June 30, 1929	
Alabama	575,000	135,000	148,000	152,000	26%
Arizona	118,000	41,000	47,000	47,000	40

Wisconsin	696,000	458,000	494,000	506,000	73
Wyoming	65,000	28,000	30,000	30,000	46
Total U. S.	28,808,000	17,886,000	19,069,000	19,430,000	67%

(a) Seasonal variation involved due to summer homes being opened or winter homes closed.
(b) Over 100%. Due either to classification of meters, or to estimated population, or both.

According to these figures, the Electrical Index of Industry and Trade, prepared by the association, indicates that business in June was 9.7 per cent above the normal for that month, as measured by the trends of the past ten years. This is a drop of almost three per cent from the high figure for May (12.5), but still represents a substantial increase over the level of 6.0 per cent which prevailed in June of last year.

The N. E. L. A. Index of Industry and Trade is based upon the deviation of the total output of electricity by all agencies which contribute to the public supply, plus imports from Canada, from a computed "normal" figure for each month, which "normal" is adjusted for the continued growth of the light and power industry and is further corrected for seasonal variation as indicated by the monthly totals of the past ten years.

ENGINEERING SECTION

Alex. D. Bailey, *Chairman* **H. S. Bennion**, *Director of Engineering, N. E. L. A.*

Annual Reports of Engineering National Section Committees

Editor's Note: Herewith are continued the summaries of the activities of Committees of the Engineering National Section during the administrative year 1928-1929. This information, in previous years has been presented in the form of reports to the National Convention. It is now felt, however, that because of the nature of the reports, and the greater and more diversified circulation of the N. E. L. A. Bulletin, that the reports would prove of wider usefulness if published in this medium.

Report of Electrical Apparatus Committee

J. Allen Johnson, *Chairman*

THE Committee has followed the same general plan as for the last several years of having a few subcommittees, each of fairly broad scope.

The Subcommitte on Fundamental Plan of Systems was discontinued, its work having been transferred to the new Power Systems Engineering Committee.

Two new standing subcommittees were created. That on National Code Revisions is charged with the duty of keeping the committee informed and assisting in shaping its policy in code matters. That on Publications is charged with the duty of studying and developing the committee's publication policies and practices and with assisting and furthering the exchange of information between the Geographic Division Committees and the National Committee.

During recent years a demand has arisen among operating men for a common meeting ground. This demand has shown itself through the formation of "operating committees" in several of the Geographic Divisions. This demand may be attributed partly to the many interconnections and consolidation between formerly isolated utilities, requiring coordination of operating practices, and to the creation, partly as a result thereof, of a large group of operating engineers charged with responsibility for service, but free from the exacting requirement of actual superintendence, and thus able to get away from their jobs occasionally to exchange ideas and experiences with their fellows. The most suitable existing medium for meeting this demand is the Operating Practice Subcommittee of the Electrical Apparatus Committee, and accordingly this subcommittee was expanded to include a larger number of such operating engineers.

Meetings and Discussions

Four two-day meetings were held during the year, with an average attendance of about 75. Prepared articles and reports presented at these meetings and summaries of discussions which took place are available in the committee's minutes.

Serial Reports

The following Serial Reports were published during the year:

1. "Progress in Generator Design and Practice." (N. E. L. A. Pub. 289-37.)
2. "Outline of Fundamentals of System Interconnections." (N. E. L. A. Pub. 289-60.)
3. "Storage, Handling, Treatment, Inspection and Testing of Insulating Oils." (N. E. L. A. Pub. 289-48.)
4. "Uniform Records of the Electrical Operation of Power Systems." (N. E. L. A. Pub. 289-52.)
5. "D.C. Substation Design Practice." (N. E. L. A. Pub. 289-82.)

Bulletin Articles

In addition to reports of all meetings, the following articles were published in the N.E.L.A. Bulletin:

1. Symposium on Layout of a Hypothetical Substation. (Published serially in September, October and November, 1928.)
2. Symposium on Design of High Voltage Outdoor Substations. (Published Serially in December, 1928, January, February and March, 1929.)
3. Reliable Time Delay Under Voltage Devices Now Available. (March, 1929.)
4. Miniature Control Switchboards. (April, 1929.)
5. Transformers and Regulators. (April, 1929.)
6. Preferred Voltage Ratings for A.C. Systems. (April, 1929.)

Formal Actions

The following resolutions were adopted during the year:

(1) *Resolved,* That the revised schedule of Preferred Voltage Ratings, September, 1928, be approved as a satisfactory working plan, to meet existing and future needs of the industry.

(2) *Resolved,* That Paragraphs 13-600, 13-601, 13-602 and 13-603 on Recommendations for the operation of transformers on a temperature basis published by the A. I. E. E. in the Report on Standards for Transformers, Induction Regulators and Reactors (proposed revision of present standard Section 13), dated August, 1928, are hereby approved by the Electrical Apparatus Committee as a suitable basis for securing operating experience on the effect of operation of transformers at ambient temperatures other than 40 deg. C. for air and 25 deg. C. for water.

(3) *Resolved,* That the Apparatus Committee empower its Chairman to take such official action as is necessary to coordinate these groups (N. E. L. A., N. E. M. A., A. E. I. C., A. E. R. A., A. R. A., A. I. S. E. E. and others), to the end that cooperative action may be established (in the matter of standardization of oil circuit breakers).

(4) *Resolved,* That the Electrical Apparatus Committee subscribe to the recommendation of the United States National Committee of the I. E. C., that no change be made in the present standard ambient temperature of 40 deg. C. for rating electrical equipment.

(5) *Resolved,* That the Electrical Apparatus Committee recommends that on and after January 1, 1931, 110 volts be dropped as a "nominal system voltage." Attention is, however, directed to the fact that actual voltages exist which make it inadvisable to re-design appliances and motors for nameplate voltages other than those now used.

Report of the Hydraulic Power Committee

Byron E. White, *Chairman*

THE Hydraulic Power Committee has had a very successful year marked by the production of a number of serial reports of considerable value. They relate to the following subjects: power house cranes, penstock design, penstock valves, spillway gates, hydro-electric units as synchronous condensers, reliability of hydro-electric units, and a combined series of manufacturers' statements and bibliography of hydro-electric subjects.

These reports contain several noteworthy additions to the literature of hydro-electric engineering, and include considerable design data and suggested practice which will be of assistance in carrying out the principal objective of the Engineering National Section; namely, more kilowatt hours and more kilowatts per dollar of investment.

Very substantial and gratifying progress has been made in the work of the subcommittee charged with cooperative efforts in connection with the U. S. Bureau of Fisheries, looking to a solution of the fishway problem. The electric fish screen for directing the movements of fish and preventing their entry into regions where they are unwanted, has proved to be quite successful.

The problems of speed or frequency regulation, and proper division of load between units in a plant, and between plants in an interconnected system, has become much more acute as larger and larger regions have been tied together by substantial transmission links. As an outgrowth of this, there has recently appeared a definite need for better equipment for the regulation of frequency and division of load, either as an integral part of the customary governors, or in separate apparatus. A new Subcommittee on Governors has made very substantial progress in outlining the requirements, and is proceeding to get together the experience of operating companies, manufacturers, and others, with existing types of apparatus, and will no doubt outline the requirements of additional apparatus which may be necessary for the purpose, and not now available.

The comparatively recent and disastrous failures of certain dams has also impelled the Committee to entrust to a subcommittee the duty of endeavoring to outline a suitable study of such failures, and of the details of dams, with a view to making proper recommendations, tending to result in safe practice in the construction of dams.

Another subcommittee is keeping in close touch with a number of individuals and companies who are endeavoring to perfect means of forecasting future water supply for hydro plants. This is a most important subject, and while progress is slow, new information and new ideas of a practical sort are constantly developing, and through the Committee are given to the members and broadcast to interested operating companies.

Recent practice in the design of automatic and semi-automatic hydro plants is being summarized by another subcommittee.

The subject of protective coatings of paint for penstocks is also being investigated with a view to putting in the hands of operating companies the accumulated experience data of the industry as rapidly as they are developed.

The problems of operation of hydroelectric plants will be considered by a special subcommittee, which has recently been appointed.

Other subjects which will be studied by recently appointed subcommittees are the welding of water wheels, electric arc welded pipes, the fatigue of metals in penstocks, and vacuum breakers as applied to hydro-electric units.

The Subcommittee on Water Wheel Testing consists of members of the Hydraulic Power Committee, who are designing and constructing engineers, and representatives of the principal water wheel companies. This subcommittee is concerning itself with problems relating to the improvement of the design and operation of hydraulic turbines and their appurtenances, and is in effect a Conference Committee.

Prospectus of Work of the Hydraulic Power Committee for 1929-30

BYRON E. WHITE, *Chairman*

THE province of the Hydraulic Power Committee includes the consideration of all technical matters relating to water power, water storage, machinery and structures whereby water power is turned into energy to drive electrical generators. While great perfection has been attained in hydraulic turbines and related apparatus and structures, and efficiencies of turbines have risen to considerably in excess of 90 per cent, thus leaving little to be attained, there are still many important problems with which engineers may contend, with the definite promise of worthwhile results.

The economics of hydro-electric versus steam and other fuel power production has been forced to the front by the rapidly increasing efficiency, and consequently decreasing cost of fuel generated energy. As a result, hydraulic engineers are being forced more and more to consider not only the original construction cost, but also its maintenance, depreciation, obsolescence, and operation.

With this situation facing hydraulic engineers, many practices and many types of structures and machines, which had been considered standard for years, have been found in need of examination as to the possibilities of further improvement, cheapening, or the development of alternative and more economical constructions or methods.

In order to cope with these problems, the Hydraulic Power Committee has organized a considerable number of subcommittees designed to study and report on specific phases of hydraulic engineering.

The Water Wheel Testing Subcommittee, composed of representatives of the utilities and of the principal water wheel manufacturers, is attempting to coordinate the viewpoints of the users and the makers of hydraulic equipment, with a view to meeting the requirements mentioned above. Through wholehearted and friendly cooperation, it is hoped and expected that much of the difference in viewpoint between these two extremes may be compromised, for the good of all.

Another subcommittee is watching all current developments in the highly abstruse and speculative field of forecasting water supply, the very life-blood of hydro-electric power. Several promising developments in this line have been brought to its attention, and valuable progress is being made. The subcommittee will make these available to the industry as rapidly as they are brought out and proven to have value.

A valuable report on penstocks of various materials is being assembled, and will undoubtedly be published in the autumn of 1929. Much new material has been brought to light, and more is in the making. A subcommittee is studying the use of welded steel pipes for penstocks, while another subcommittee is studying the fatigue of metal in penstocks, evidences of which have recently been discovered.

A report which will be a compendium on automatic and semi-automatic hydro plants is also in the making, and should prove of value to all who are interested in such plants.

The subject of protective coatings for penstocks is being investigated by a special subcommittee, but on account of the nature of the problem and the long periods of time which must elapse before definite conclusions regarding a coating may be drawn, it is likely that the final report may be delayed for a long time. Any worthwhile developments along this line, however, will be brought out periodically by the subcommittee, and made available to the industry.

With the development of vast interconnected systems covering large geographic areas, the problem of frequency or speed regulation has become very prominent, and more or less acute. A special subcommittee is investigating hydraulic turbine governors and frequency control equipment, and is fortunate in having the complete cooperation of those who have developed the most recent and most promising frequency control equipment. Something tangible may be expected in the way of a report from this subcommittee before the end of the present administrative year.

The problem of fishways, fish stops and screens, which is acute in the Northwest, is being cooperatively studied on a working basis by a special subcommittee, which is cooperating with the utilities in the Northwest and the U. S. Bureau of Fisheries. Valuable and promising results have already been obtained, and the program for the coming year is such as to assure still further, and perhaps more or less final results.

Recognizing that the committee had heretofore been made up principally, if not almost exclusively, of designing engineers, a number of operating men have recently been made members. A subcommittee on Hydro Operating Practices has been organized, whose function will be to consider problems of operation of hydro-electric plants and systems, and to cooperate with the main committee and other subcommittees by injecting the operating point of view into their deliberations and reports.

A subcommittee on the Welding of Water Wheels has also been constituted to take up and extend a study previously made, and particularly to consider the use of recently developed bronzes which have shown remarkable resistance to pitting. It is hoped that the work of this subcommittee will aid greatly in finding a solution to this troublesome problem and thus reduce the cost of maintenance work and the outage of units, brought about by the pitting of runners and other appurtenances.

Another subcommittee is preparing a report on vacuum breakers for hydroelectric units, which is expected to be published during the coming year.

A special subcommittee is endeavoring to outline a procedure by which it can carry on a study and make a report dealing with the essential features of dams, with the object of giving to hydraulic engineers more positive data in regard to the stability of various types of dams and proper methods of construction than now is available.

A number of other subjects not listed will come before the Committee for consideration as to whether or not they are of sufficient interest and value to warrant their consideration and the making of reports upon them by special subcommittees.

In conclusion, it is proper to emphasize the fact that this is a working committee of men who are intimately identified with hydro-electric work, animated by a cooperative spirit and a desire for knowledge. The intimate personal acquaintanceship which has been established at the meetings, and even more particularly during the two inspection trips last year, have been productive of much good to all concerned, through the interchange of personal knowledge and experience. Much of this interchange of information would not have been brought about were it not for the close relations of these men over periods of several days. For that reason it can be asserted that the inspection trips are more than worthwhile, while the more or less formal meetings of the Committee serve to crystallize the ideas which have been previously partly developed. Executives are therefore earnestly requested to permit such of their subordinates as are members of the Committee to participate fully in the semi-annual meetings, and in the inspection trips as well, as it is only in this way that the maximum tangible benefits can be secured by the individual companies and members.

The 1929-30 Program of the Accident Prevention Committee

C. R. Beardsley, *Chairman*

FOR several years the Accident Prevention Committee has aimed to increase the interest and pressure exerted by key men and executives. Observation has proved without question, that the companies having the best records of accident elimination are those in which safety effort begins at the top. Whether applied to the whole company or to a department or a small group, the trend is very largely determined by the attitude of the man in charge.

It is thought by some that the National Accident Prevention Committee has no mandate to stimulate Geographic Divisions or Member Companies to higher performance, but that the initiative should be within the Geographic Divisions. The majority view, however. has decided the course of pointing out accident experience trends and otherwise endeavoring to secure greater local effort, particularly where the records are not favorable in comparison with national averages.

The program for 1929-30 therefore has two main divisions: (1) detail studies of hazards. safe practices, training employes; (2) cooperation with other bodies such as National Safety Council, American Gas Association, and with other groups in the N. E. L. A. (Divisions, Committees, Member Companies) in promoting the safety activities and use of information prepared under the first classification.

Among the detail studies to be made on hazards and safe practices are the following (Several are nearing completion):

Accident Cause Analysis—Ascertain chief causes.

Automobile Accidents—Study training of drivers.

Cable Identification—Complete study of marking or checking identity.

Construction — Hydro-electric plant construction hazards, etc.

Fire Prevention — Review of fire causes and fire fighting methods as to human safety.

Handbook of Safety Training—Outline of training for foremen.

High Voltage Tests — Study of kenotron testing.

Hot Line Tools—Safety in live line work.

Interlocks—Study of methods of compelling correct sequence and protection in switching operations and grounding for protection of workmen.

Low Voltage Hazards — Continue work started in 1928-29.

Resuscitation—Find means to spread knowledge.

Rubber Gloves—Complete the study of glove development and practices.

Safety Provisions—Complete the catalog of methods, devices and appliances.

Tree Pruning—Complete the study of tree pruning methods.

The program for securing greater interest includes the following items:

Cooperation with National Safety Council—A conference called at Pittsburgh during the Summer was attended by representatives of N. S. C., N.E.L.A., A. G. A., and the Telephone and Telegraph group, all of whom are associated in the Public Utilities Section of the National Safety Council. A program was prepared aiming to avoid duplication, cross purposes, and wasted effort, and leading to mutual support and concentration of effort.

Codes—Study proposed codes as to safety features.

Cost of Accidents—Study costs for reporting to executives.

Editing and Publicity—Edit and circulate data.

Educational Institutions — Interest Engineering students.

Geographic Divisions—Correlate and stimulate work in the divisions. A manual for Geographic Division chairmen is in circulation.

Statistics—Make a careful study of data at hand for use in stimulating activity. This is well under way.

As these studies progress it is hoped to secure publication of salient facts in the N. E. L. A. Bulletin, *Electrical World* and elsewhere for the widest possible spread of the information.

It should be emphasized that this is not a single year's program, but part of a course determined a few years ago with a definite objective attack. It is proposed to lay out work ahead in conjunction with the other safety organizations so that all efforts will be coordinated and effective.

Inductive Coordination Problems in Joint-Use Lines Under Study by Joint Committee

THE advantages gained by the joint-use of pole lines in urban communities are fully recognized and the practice of carrying power-distribution circuits and telephone subscriber circuits on the same pole line is now very common. Due to the rapid extension of open-wire power and telephone circuits into rural communities, the extension of joint use to this class of service appears desirable for many reasons. However, since the physical separation of the two classes of circuits under above conditions is small, usually 4 to 6 feet, the problem of inductive coordination of the circuits to prevent excessive noise in the telephone lines requires considerable study. Project Committee No. 6* has been investigating the technical problems of inductive coordination that are involved in exposures of these types. Experimental work was carried on for two years at Minneapolis, where particular attention was paid to problems arising with open-wire power-distribution systems and local telephone circuits in cable. The results of these tests are presented in Engineering Report No. 6 of the sub-committee. Since the completion of the Minneapolis field work, the project committee has been continuing its investigation at Elmira.

Scope of Elmira Investigation

The investigation at Elmira is primarily concerned with the second type of joint-use exposures mentioned above, viz., those in which both the power and telephone circuits are in open-wire. In scope, the work includes:

1. A detailed study of the source and magnitude of noise-currents produced in various types of telephone circuits when exposed, at joint-use separation, to various types of power-distribution circuits.
2. The study and development of remedial measures which may be effectively used to decrease the susceptiveness of the telephone circuits and to decrease the influence of the power circuits.
3. The development of a practical set of empirical formulas for use in solving certain types of inductive coordination problems.

Testing Facilities

The testing facilities include an 8-mile section of toll-lead which was scheduled for dismantling, 2½ miles of which have been reconstructed in accordance with present standards of joint-use construction. The line is located 7 miles west of Elmira, N. Y., along the Delaware, Lackawanna & Western R. R. right-of-way. Four power conductors and 30 telephone conductors are provided in the 2½-mile section, all terminating in a test-house. The test-house and the configuration of the line are shown in the illustration. The circuits shown on the opposite side of the right-of-way are the signal and automatic train-control circuits of the railroad company. Termination boxes are provided in the experimental line at half-mile intervals, as a means of varying the length of a test section. A 2000-foot length of telephone cable extends from one end of the line and is used to determine the effect of an entrance cable on noise induced in open-wire circuits. The test-house contains equipment for energizing the power circuits at frequencies from 60 to 3000 cycles, and for measuring the induced currents and voltages in the telephone circuits. Tests of this nature require the measurement of extremely small voice-frequency currents and voltages. A telephone circuit analyzer, developed by the Development and Research Dept. of the A. T. &. T. Company, capable of measuring a current of .05 microamperes at an input impedance of only 600 ohms, is used for these measurements. Its frequency-selectivity permits the measurement of the individual frequencies in a composite wave.

Experimental Line Tests

The work covered under Item 1, above, involves mainly the determination of the coupling between power and telephone circuits and the susceptiveness of telephone circuits under the wide range of conditions that occur in practice. Coupling coefficients have been obtained for single-phase and three-phase energization of the power circuits. Since the power and telephone circuits are in open-wire, the longitudinal-circuit and metallic-cirinduction, both current and voltages are important in the telephone circuits. A complete determination of the coupling, therefore, requires measurements of both the longitudinal-circuit and metallic-circuit coefficients for two methods of energization: (1) with the far end of the power line open and isolated, to give mainly voltage induction, and (2) with the far end shortened, to give mainly current induction. These data have been obtained for a variety of power circuit configurations.

The susceptiveness of the telephone circuits is determined by measurements of the metallic-circuit current or noise that results when circuit unbalances are acted upon by a given amount of longitudinal induction. The effects of individual unbalances are measured separately as a means of determining their relative importance, and combined to get the overall results.

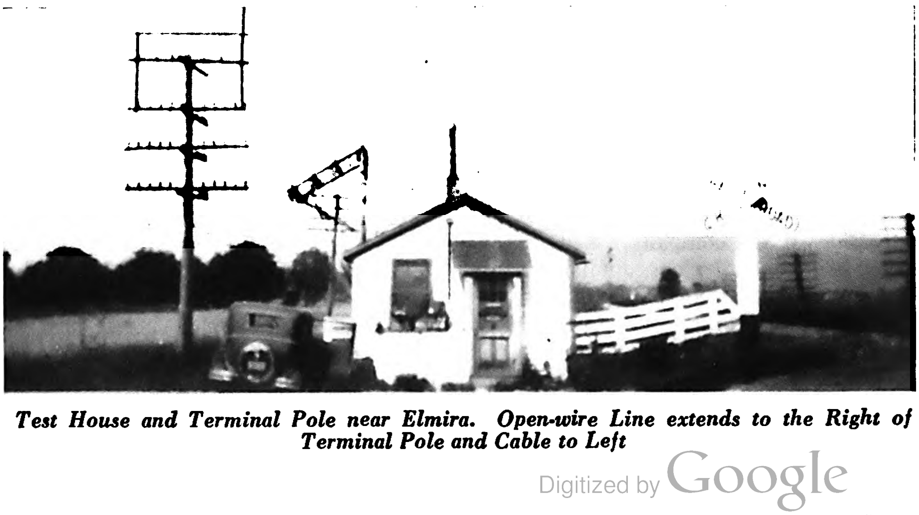
Where practical, measured quantities are checked by computation as a means of extending the range of the experimental work. This also serves as a check on the accuracy of the data.

Empirical Formulas

The results of the various tests are being reduced to empirical formulas which will aid in the solution of everyday field problems. The remainder of the field work in Elmira will consist largely in trying out these formulas on local power and telephone circuits.

Tests on Automatic Train Control Systems

Before the regular program of work was started, a series of tests were carried out in cooperation with the D., L. & W. R. R. Co. to determine if interference with their automatic train control system would result from 60-cycle energization of the experimental line. The continuous two-speed inductive type of control system was used and operated at a frequency of 60 cycles. The train control system was later changed to 100-cycle operation and the tests repeated. Although this work did not fall within the scope of work of Project No. 6, these tests presented an opportunity to obtain some important information.



Test House and Terminal Pole near Elmira. Open-wire Line extends to the Right of Terminal Pole and Cable to Left

WOMEN'S COMMITTEE

Miss Sara Harris, *Chairman* Miss Isabell Davie, *Secretary*

News Letter

By Mrs. Thelma Van Ness
Publicity Chairman

THE Women's Committee of the Southern California Edison Company at Los Angeles, according to a report by Mrs. Jeannette I. Rees, chairman, has just completed a very active and successful year. One of the features of the work was a First Aid Team, Miss Alice Smith, captain, which won second prize in the State First Aid meet. At the meeting following the 1928 Pacific Coast Division N. E. L. A. Convention, First Aid was the subject for discussion and so much enthusiasm was aroused that a large number of the girls signed up for a First Aid Lecture Course, carried on during noon hours. This course lasted about six weeks and resulted in the formation of their prize girls' team.

Last fall this group took up the study of government ownership, Boulder Dam, etc., and even presented an original playlet on the Colorado River proposition at one of its meetings. Appliances and stock were discussed at length as suitable and practical Christmas gifts at their November and December meetings. In March of this year over two hundred girls made an inspection trip to the Long Beach steam plant. A private train of six coaches carried this enthusiastic crowd of Edison girls to and from Long Beach and a detour was made on the way down to enable the girls to visit the Lighthipe substation.

Mrs. Phyllis Vauchelet was the first prize winner in the essay contest held by the Southern California Edison Company and Miss Helen McMillan of the Montebello district office won against all other Edison contestants in the Pacific Coast Division three-minute public speaking contest on the subject of "Use It Yourself."

* * *

Northwestern Echoes, published by the Women's Committee of the Northwestern Public Service Company, Huron, S. D., contains a number of interesting news items pertaining to the operation of the company. Line extensions, boiler installations, appliance sales, meter schools and company statistics are topics included in the brief paragraphs of interest to the Women's Committee.

* * *

The *Live Wire Newsette,* published by the Women's Committee of the Iowa-Nebraska Light and Power Company, reports a number of active groups. The Clarinda Live Wires prepared their own dinner at the June meeting and have planned a picnic and swimming party at which they will learn the Prone Pressure Method of Resuscitation. At Maryville, Miss Hilda Lahr received $10 prize money as a result of her iron sales during the Hotpoint Iron activity. At Avoca the girls have made a close study of appliances. Every girl in this group can demonstrate the ironer.

* * *

Occasioned by the recent Public Speaking Contest held in the Southeastern Division, each committee of the Florida Power and Light Company will continue to stress this important subject. A series of brief talks on "Electricity in the Home" are now being conducted by the Palatka Committee under the Chairmanship of Miss Katherine Lattimer. Renewed activity in First Aid is also being reported by the various committees of this company. A study class is being organized by the Miami Committee.

A grand prize of $50 was awarded Miss Irene Hinton of the Sanford office for her paper submitted in the Florida Power and Light Company's first Public Relations Program Contest.

* * *

In connection with the July meeting of the Illinois Northern Utilities Company Women's Committee at Dixon, a discussion of refrigeration was held. Two contests open to the girls terminated at this meeting; one an essay contest on the subject, "Why Refrigeration is Necessary," and the other a slogan contest on the subject, "The Benefits of Refrigeration." Cash prizes were offered and the winners were announced at the meeting. This is the third of a series of meetings held by this Women's Committee under the title of "Short Course in Gas and Electrical Equipment." Miss Edna J. Decker is chairman of the committee.

* * *

The June number *Cipsco News,* published by the Central Illinois Public Service Company, carried interesting pictures depicting the growth of the Women's Committee of Division P of that company. The first picture, dated Jan. 22, 1922, showed nine girls in this group and the later picture, taken in May, 1929, was a larger group of twenty-five girls. Miss Margaret B. Ward is the chairman.

Miss Emma Winkhart of the Central Illinois Public Service Company has been conducting the weekly meetings of the Girl Scouts, devoting each meeting to a special topic covering subjects on First Aid and Health. The girls in this company assisted in the heating pad campaign held last spring, and sold 2,717 pads or 271 per cent of their quota. In a toaster campaign held the following month, the girls sold 1,500 toasters or 150 per cent of their quota. Four members of the Women's Committee gave a playlet before the Business Women's Club and Directors of the Y. W. C. A. "Evolution of Lighting" was presented to the McDonough Federation of Women's Clubs. Miss Theresa Carroll, general chairman of the Central Illinois Public Service Company Women's Committee, addressed the Business and Professional Women's Club in Mattoon, Ill., on "Women in Business."

* * *

One hundred and twenty-five guests, representing members of the Augusta Girls Community Club, the Augusta Business and Professional Women's Club, the Augusta League of Women Voters and wives of the company employees, were entertained at a special meeting of the Women's Committee of the Central Maine Power Company at Augusta, Me., recently. Senator Dora Pinkham was among the speakers and Miss Bradford of the Postum Company demonstrated the use of several electrical appliances and prepared a complete meal during the course of her talk.

* * *

Approximately one hundred and twenty visitors, which included the members of the Women's Club, the Parent - Teachers Association, the Mayor, an attorney and newspaper reporter, as well as the Kentucky Utilities managers, attended the meeting of the Women's Committee of the Madisonville District, Kentucky Utilities Company. Talks were made by the Mayor, members of the Women's Club, Parent-Teachers Association representative, the attorney and members of the Women's Committee.

* * *

The Public Service Company of New Hampshire Women's Committee include in all their meetings visitors from outside organizations such as Business and Professional Women's Club, Parent-Teacher Associations, United Mothers' Club, Delfian Club, 19th Century Club, City Administration, banks and newspapers. Librarians and teachers are also among the invited guests.

Mrs. Josie Leavitt was the winner of the Manchester District and Company prizes of the Public Service Company of New Hampshire in the essay contest on the subject, "What the 1928 Public Relations Program for Employee Meetings Meant to Me."

* * *

The Southwestern Gas and Electric Company Women's Committee at Marshall, Shreveport and Texarkana Divisions, also invite a number of representatives of outside organizations to all of their meetings. These organizations include chambers of commerce, newspapers, manufacturers, women's clubs, Business and Professional Women's Club and Parent-Teacher Associations. The Commissioner of Public Utilities, County Demonstration Agents and the Mayor of the city have also been among those invited to attend.

Miss Elizabeth Thomas of this company was awarded cash prize for the best essay on the subject, "What the 1928 Employee Educational Meetings Meant to Me."

Both district and company prizes in the West Texas Utilities Company Public Relations essay contest for employees were won by Mrs. Nona K. Bagwell of the Haskell office.

* * *

Laundry schools have been held throughout Twin State Gas and Electric Company properties of Vermont, to which were invited women of the community. Responses have been very gratifying. Talks included addresses on the Women's Committee and complete instruction on laundering.

* * *

Miss Knobel of the Wisconsin Power and Light Company conducted a cooking school at the Portage office for the office girls and wives of employees, demonstrating the gas range and refrigerator. She also showed the women how to use the toaster and waffle iron.

* * *

According to *The Round Table,* published by the Women's Committee, Kansas Section, the girls of the Independence district, Kansas Gas and Electric Company, recently enjoyed a week-end camping trip at the Neosho Plant with District Manager Murrow and Mrs. Murrow as hosts. Mr. Murrow and the engineers explained the intricate operation of the plant to the girls, thus providing an instructive as well as entertaining week-end party.

* * *

Announcement is made in *Electro Topics,* published by employees of The Tennessee Electric Power Company, at Chattanooga, of the election of Miss Lena Grimm as chairman of the Women's Committee of that company. Miss Grimm served last year as vice-chairman and the year preceding as secretary. She represented the company in the State public speaking contest conducted by the Tennessee Women's Committee of which Miss Dorothy Murhpy is chairman.

* * *

"The Distaff Side" is the title of the new department for women in "Power News," published in Indianapolis by and for the employees of the Interstate Public Service Company and the operating subsidiaries of the Central Indiana Power Company. Miss Marie Tudor, director of the Home Service Department of these companies, is the editor of this page.

* * *

A recent issue of the *Puget Sound Electric Journal* carries a picture of Miss Dorothy Chase of the Western District, Puget Sound Power and Light Company, who has been elected president of the Women's Business and Professional Club of Bremerton, Washington. A number of Puget Sound Power and Light Company girls attended the convention of the Business and Professional Club held in Seattle.

The Puget Sound Women's Committee recently arranged the program of a meeting of the Business and Professional Club at Seattle. Mr. J. C. Scott gave an illustrated talk on "Electricity on the Farm," musical selections were given by company artists and electrically frozen desserts with electrically baked cakes provided the refreshments.

* * *

The Women's Committee of the Wisconsin Power and Light Company, Madison, Wis., has recently organized a First Aid Drill Team as have also the Northern States Power Company Committees at Red Wing, Minn., and La-Crosse, Wis.

The First Aid Team of the Northern States Power Company at Eau Claire, Wis., gave their demonstrations before the Kiwanis Club, Red Wing, Minn., at their luncheon on July 11. The total audience was sixty, including two doctors and the physical director of the Y. M. C. A. The girls received many compliments on their work.

The judges in the state-wide program contest, which was conducted by the Women's Committee of the Wisconsin Utilities Association over a period of a year, have had one meeting and adjourned without having arrived at a decision. They found that all of the committees have conducted such high grade programs, attended so regularly and reported so fully that it is difficult to grade them. They will meet again shortly to go over the material and arrive at a definite decision.

Women's committee activities have been carried on in the Wisconsin Division of the Northern States Power Company for five years—there being three committees. June 22 marked their first all-division conference which was held at Eau Claire, Wis. Eighty-two women employees registered. District managers and their wives attended. Miss Helen Welsh, president of the local committee, presided. Mr. G. V. Rork, division manager, gave the address of welcome and a program followed in which ten members from the various districts participated. Papers were read and a demonstration was given by the First Aid Drill Team. There was one outside speaker. During the latter part of the afternoon the women were conducted in small groups through the Wissota Hydro Plant and the New Hydro Plant at Chippewa Falls, Wis. They were entertained in the evening at a dancing party given at Lake Hallie Park, which is company property.

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

Ladies' Home Journal—August
This Age of Refrigeration—Gove Hambidge.
September
A New Food Vision—Gove Hambidge
Music and Modern Magic—Walter Damrosch

Good Housekeeping—August
Your Laundry—Eva Wilson
Another Chapter on Floors—Helen W. Kendall and Curtis C. Wyrtzen.
September
A Refrigerator That Meets Your Needs—Katharine A. Fisher
How Hot Should Your Iron Be?—Helen W. Kendall and Curtis C. Wyrtzen
Which Cleaner Shall I Buy?—T. L. Henderson

McCall's Magazine—September
Wiring the House Old or New—Anne Pierce

Woman's Home Companion—August
Telling the World—Hazel Rawson Cades.

Pictorial Review—August
Modern Laundry Equipment—Margery Beem

Modern Priscilla—August
New Acquaintances in Cooking Equipment—Margaret H. Hartnett. September
Labor Saving Laundry Methods

Better Homes and Gardens—August
Warmer Meals from Cooler Kitchens—Katherine Goeppinger

People's Home Journal—September
Cleaning a la Mode—Margaret Palmer

Delineator—September
We Develop New Ways of Washing
Refrigeration the Year Round

RELATED and other ORGANIZATIONS

Berlin Chosen for World Power Conference

SIX years after the notable World Power Conference held at London in 1924, the second plenary meeting of this international body will take place in Berlin from June 16 to June 25, 1930. Berlin was selected as the meeting place by unanimous resolution of the 47 member nations of the conference, and the meeting will bring together many of the most prominent authorities on power and fuel from all over the world. Dr. Gerhard Dehne is acting for the managing organization at Berlin. O. C. Merrill of Washington is general chairman of the American committee, and all communications relating to the conference should be addressed to him. All papers submitted from the United States must go through the American committee, which will forward them to Berlin, the latest date for their receipt there being Nov. 1 of this year.

Copious information and counsel has been printed and is available for those thinking of preparing papers. This information emphasizes the point that the conference of 1930 will deal principally with the distribution and utilization of power and that economic considerations rather than technical and engineering questions will be emphasized, technical questions being of interest only in so far as they concern the most recent progress.

It is announced that, "In the wide field of electrical generation, an international discussion would be of the greatest interest regarding the considerations that are at present decisive in the questions of selection and subdivision of generating plant in large central stations. In connection with this the problem of the storage of electrical energy and provision for peak loads deserves special consideration." The many electrical topics that have been suggested fall under the three divisions of generation, distribution and utilization.

"The subject of water power," the statement says, "was dealt with fairly exhaustively at the section meetings at Basle in 1926 and Barcelona in 1929. It will thus be advisable to limit the choice of subjects at the plenary conference in 1930 in order to avoid repetition and to direct attention particularly to recent progress and advances. Nevertheless, the utilization of water power in general plays such an important part in most countries in the whole question of power economics that the advances made in various directions should be set out systematically. It will be of advantage to class these advances under the following principal headings: Developments in regard to economy; extension and utilization of water power; progress in matters of water-power storage; new developments in the construction of water turbines and pumps, and experience and progress in matters of water economy."

Conference at Camp Cooperation

REPRESENTATIVES of 43 local electrical leagues held their eighth annual conference Aug. 2-6 at Camp Cooperation, Association Island, Henderson Harbor, N. Y., with 200 in attendance. R. Bourke Corcoran of Chicago, chairman of the League Council, presided, sessions continuing from Friday until Tuesday.

The program embraced a broad discussion of league operation and financing and, in addition, the following addresses: "The Place of the National Electrical Code in Our Business Development Work," A. Penn Denton, engineer National Electrical Manufacturers' Association: "Franklin Red Seal—A National Plan to Increase Lighting Business," Arthur E. Allen, vice-president and general manager Westinghouse Lamp Company; "How to Sell New Lighting Equipment to Old Homes," Charles L. Benjamin, managing director Artistic Lighting Equipment Association; "Building and Maintaining Satisfactory Relations with Architects," Leroy E. Kern, technical secretary the American Institute of Architects.

R. Bourke Corcoran was reelected chairman of the League Council and D. C. Burdsell vice-chairman.

Conference for Rural Service Men

THE third annual Conference for Rural Service Men of electric light and power companies will be held October 10-12, inclusive, at the Agricultural Experiment Station of Purdue University, Lafayette, Ind. The tentative program includes the following addresses:

"What Progress Are We Making in Farm Electrification?" Eugene Holcomb, Jackson, Mich., Chairman, Rural Service Committee, National Electric Light Association; "The Relation of the County Agent to Rural Electrification and Utility Rural Service Man," Director or Assistant Director of Agricultural Extension Work, Purdue University; "How Electric Current Pays Its Way on My Farm," Arthur Shugart, Marion, Ind.; "Operating the Thresher or Husker-Shredder with an Electric Motor," R. H. Wileman, Agricultural Engineering; "Electric Water Heaters on the Ohio Experimental Line," Prof. G. W. McCuen or I. P. Blauser, Ohio State University; "Shall We Grind or Shred Corn Stover?" Prof. J. H. Hilton, Dairy Department; "Report on New Electric Water Heaters or Use of Lights in Brooding Chicks," Prof. C. W. Carrick, Poultry Department.

"How Demonstrations and Demonstration Farms Aid in Rural Electric Development," Richard Boonstra, Public Service Co. of Northern Illinois; "How to Proceed to Analyze Potential Electric Load on Farms," Prof. E. W. Lehmann, University of Illinois; "Planning Adequate Farm Electric Service Through Proper Wiring," Douglas Dow, Detroit Edison Co.; "What Types of Electric Brooders Can We Recommend?" Prof F. D. Brooks, Poultry Department; "Shall the Dairyman Use Walk-In or Tank Type Storage?" Prof. E. H. Parfitt, Dairy Dept.; "How Fine Shall We Grind Oats for Hogs and Steers?" Prof. F. G. King, Animal Husbandry; Discussion of New and Unusual Uses of Electricity on the Farm; and an evening banquet to be featured with addresses by Fred C. Purnell and Arthur Huntington.

The program for the morning of Oct. 12 will be arranged by the rural service committee on merchandising.

Tentative Date for C. E. A. Convention

IN order to allow other geographic divisions to choose dates for their conventions which will not conflict, the Fortieth Annual Convention of the Canadian Electrical Association has been tentatively set for June 10-14, 1930, at Murray Bay, Quebec. This date is subject to a slight alteration, dependent upon the C. E. A. being able to close a contract for the exclusive use of the hotel for these dates.

Official Ticket Selected for S.E.D. Directors

BELOW is the official ticket of the nominating committees for directors of the Society for Electrical Development. The election will be held at the annual meeting on Sept. 13, in the society's offices, New York.

To represent central-station group: One year, M. S. Sloan, M. E. Sampsell, Paul S. Clapp; three years, Charles L. Edgar. To represent manufacturer group: One year, H. B. Crouse, A. E. Waller, W. E. Sprackling; three years, Gerard Swope. To represent wholesaler group: One year, G. E. Cullinan, E. Donald Tolles, John L. Buchanan; three years, Edwin M. Keatley. To represent contractor-dealer group: One year, C. L. Chamblin, L. W. Davis, S. C. Blumenthal; three years, C. M. Beltzhoover. To represent "at-large" group: One year, F. D. Gill; three years, James H. McGraw. To represent local electrical leagues: One year, R. B. Corcoran, D. C. Birdsell, J. E. North, J. H. Van Aernam; three years, H. H. Courtright.

WHAT OCCURRED LAST MONTH

Colorado River Project

The Interstate Commerce Commission has granted the Los Angeles and Salt Lake Railroad permission to construct a branch line in Clark County, Nev., to a point south of Las Vegas, from which the road would be continued by the government to the dam site.

* * *

Congressman Taylor of Colorado, maintaining that the Boulder Dam act, despite its proclamation by the President, will not be effective until after the contracts for power have been signed, is protesting vigorously against any action by the Federal Power Commission on pending applications, on the ground that to grant any of them would militate against the interests of the Upper Basin states.

* * *

Consolidations, etc.

The Public Service Commission of New York has granted to the Western New York Gas & Electric Corporation authority to transfer its franchises, works and system to the New York Electric Corporation.

* * *

The Illinois Commerce Commission has authorized the purchase of the Henderson County Public Service Company by the Illinois Light & Power Corporation.

* * *

The Middle West Utilities Company has completed the purchase of the United Public Service Company of Chicago, a fifty-million-dollar corporation, operating utilities in Indiana, Ohio, Kentucky, North Dakota and South Dakota.

* * *

Acquisition by the Northwestern Public Service Company of the North Dakota Power & Light Company at Bismarck, N. D., the Knife River Coal Mining Company at Beulah, N. D., and the Northern Power & Light Company at Mobridge, S. D., has been announced. The acquired light and power companies, which serve 84 towns and cities in North and South Dakota, will continue under their present corporate names for the time being.

* * *

Authority to merge several Insull-owned power companies in Vermont, to be operated under the name of the Central Vermont Public Service Corporation, was handed down Aug. 18 by the Vermont Public Service Commission. The companies which figure in consolidation are the Vermont Hydro-Electric Company, Rutland Railway Light & Power Co., Pittsford Water Co., Public Service Corporation of Vermont, Middlebury Electric Co., and the Bradford Electric Light Co.

* * *

The Wisconsin Power & Light Company has bought the Northwestern Light & Power Company of Mayville, Wis.

* * *

Customer-Ownership

Sales of electric light and power company stock to customers, employees and other local parties in May consisted of 33,800 transactions involving 342,450 shares, valued at $15,588,000, according to reports received by the *Electrical World*. This is a decided increase over April and several preceding months. The average sale was $460 per transaction.

* * *

Earnings of Public Utilities

Gross earnings of public utility enterprises in June, 1929, exclusive of telephone and telegraph companies, as reported to the Department of Commerce by 95 companies or systems operating gas, electric light, heat, power, traction and water services, were $183,000,000, as compared with $189,750,000 in May, 1929, and $178,696,556 in June, 1928.

* * *

Federal Trade Commission's Investigation

The Federal Trade Commission has announced that, in accordance with a stipuation entered into by both parties and by Judge Knox of the United States District Court for the Southern District of New York, no further court action will be taken in the case of the Commission against the Electric Bond & Share Company before Sept. 16. The stipuation provides that each party shall have until that date to decide what course it will pursue. The Commission's announcement says that it has not yet decided what will be its own course.

* * *

Foreign

Private ownership and operation of public utilities is advocated as a matter of policy in the Dawes Commission's report recommending changes in the financial arrangements of the government of San Domingo. The 1929 deficit for postal telegraph, telephone and radio service was estimated at $312,762. The Commission said in submitting the report: "It is the experience of the world that public utilities are more efficiently administered and more economically operated by private interests than by government operation, and the Commission is convinced that if these public utilities can be sold at a reasonable figure, a very large saving would arrive to the government."

* * *

Per capita consumption of energy in Belgium reached 320 kw-hr. in 1928, according to the *Electrical World*. This figure compares favorably with Germany, 250 kw.hr.; France, 248 kw-hr.; England, 200 kw-hr.; Holland, 134 kw-hr.; Switzerland leads all Europe with 700 kw-hr.

* * *

Franchise Not Needed

It is stated that the recently organized Industrial Power Corporation of Chicago will require no franchise because the stockyards area which it will serve is privately owned, as is the right-of-way upon which the lines and conduits will be laid.

* * *

Government Operation

Edward N. Hurley, war-time chairman of the United States Shipping Board, speaking before the University Institute of Public Affairs at Charlottesville, Va., on Aug. 12, said $500,000,000 would have been saved by the Government if war-time shipping could have been built by private enterprise.

* * *

Hydro-Electric

The State Corporation Commission of Virginia has dismissed the application of the Virginia Public Service Company to construct a dam across North River in Goshen Pass on the ground that the streams involved in the application are not "waters of the state." The proposed dam had been opposed by the Garden Clubs of Virginia.

* * *

The *Toronto Mail and Empire* in a dispatch from Victoria, B. C., stated that the greatest water power development program ever undertaken in western Canada is now facing British Columbia, with half a dozen important utility corporations involved in petitions for hydro-electric concessions. The applications stipulate for the harnessing of 800,000 horsepower additional to that already being utilized.

* * *

The Calgary, Alberta, Power Company expects to have in service within three months its plant being built on the Ghost River, which will develop approximately 36,000 horsepower.

* * *

According to the Charlotte (N. C.) *Observer* of Aug. 8, a "New Niagara" is planned in the mountains of North Carolina and Tennessee by the Aluminum Company of America, which will, it is reported, spend $125,000,000 in development of hydro-electric projects. Eight separate dams, the paper says, are planned.

* * *

The city of Seattle, in two applications filed at the Washington State Hydraulics office, seeks the enlargement of its Skagit Gorge and Diablo Canyon Power projects on the Skagit River so that these two units will have an increased output of 67,057 electrical horsepower.

* * *

The first Lower Nisqually River power development has been authorized by the state hydraulics supervisor of Washington, who has issued permits to the Pacific Development Company of Olympia, which contemplates the construction of a plant to cost $1,500,000.

* * *

On July 26, opponents of the proposed hydro-electric development at Cumberland Falls filed with the Federal Power Commission a brief in support of their viewpoint. The brief challenges the validity of the contentions upon which the counsel of the Executive Secretary of the Commission had given an opinion that matters such as scenic beauty could not legally be considered by the Commission in acting upon power project applications.

* * *

The case of the Cumberland Hydro-Electric Power Company involving an application for the construction of a water power project at Cumberland Falls, Ky., was submitted to the Federal Power Commission Aug. 1. Action was deferred to a later meeting.

* * *

On Aug. 2 a brief urging that the application of the Cumberland company to build and operate a power plant at Cumberland Falls be granted, was filed with the Federal Power Commission by Stephens & Steely, of Louisville, Ky., counsel for counties and people of upper Cumberland Valley and the State of Kentucky. The brief set forth the advantages that would accrue to the adjacent counties.

* * *

On Aug. 7 the filing of a brief with the Federal Power Commission in opposition to the granting of an application to construct the hydro-electric project at Cumberland Falls, was announced by the Commission. The brief was filed by Traube, Doolan, Helm and Helm, and John C. Doolan, counsel for interests opposing construction of the project. The brief took issue with the conclusions set forth recently by Col. L. W. Call, chief counsel to the executive secretary of the Commission.

* * *

Opposition to the application of the Cumberland Hydro-Electric Company to develop the power resources of Cumberland Falls on the Cumberland River, in Kentucky, was expressed in a brief filed, Aug. 16, with the Federal Power Commission by the Attorney General of Kentucky, J. W. Cammack. The Attorney General challenges the legality of the proposed contract between the Cumberland River Power Company, a subsidiary of the applicant before the Commission, with the Kentucky Park Commission.

* * *

The Federal Power Commission, in calculating the cost of construction on Federally-licensed power projects, is limited by the Water Power Act to actual expenditures for construction, it is stated in an opinion rendered by the solicitor of the Commission, Charles A. Russell. Items for engineering, supervision, management, financing and development must not be included in capital expenditures, according to the opinion set forth in a memorandum to William V. King, chief accountant to the Commission.

* * *

Recommendation that a preliminary permit be granted the Potomac River Corporation of Wilmington, Del., for ultimate development of a hydro-electric power project at Great Falls, Md.-Va., on the Potomac River, was made to the Federal Power Commission by Major Gen. Edgar Jadwin, just before he retired as Chief of Army Engineers, the Commission announced Aug. 12.

* * *

Development of the Great Falls area on the Potomac River in Maryland and Virginia for park purposes, instead of for both park and hydro-electric development, was recommended by the National Park and Planning Commission in its majority report to the Federal Power Commission made public Aug. 17. The report was submitted to the Power Commission, accompanied by the dissenting minority report of Maj. Gen. Edgar Jadwin, former Chief of Army Engineers, in his capacity as chairman of the Commission.

* * *

The Missouri Public Service Commission has granted the application of the Union Electric Light & Power Company of St. Louis, Mo., for authority to purchase the site for its proposed $30,000,000 hydro-electric power dam and plant on the Osage River near Bagnell, Mo.

* * *

Senator R. B. Howell of Nebraska has announced he will seek an appropriation of $10,000,000 for a publicly owned power plant on the Platte River in Nebraska, probably at the next regular session of Congress.

* * *

The Virginia-Carolina Power Company on Aug. 17 filed with the Federal Power Commission an application for a license to develop hydro-electric power resources of the Roanoke River in Northampton and Halifax counties, North Carolina.

* * *

In the first half of the present year, new hydro-electric developments have added 200,000 horsepower to the power resources of the Dominion of Canada, according to the mid-year review of the Water Powers Branch of the Dominion Government, while works under way will add 2,000,000 horsepower to the grand total.

* * *

An ultimate expenditure of approximately $20,000,000 is foreshadowed by the preliminary permit granted by the Federal Power Commission to the Washington Electric Company of Seattle, a Puget Sound Power & Light Company subsidiary, for its Rock Island power project on the Columbia River at a site near Wenatchee, Wash.

* * *

Mine-Mouth Plants

The state authorities of Pennsylvania are considering the applications of the Philadelphia & Reading Coal & Iron Company for charters for 33 electric public utility companies to operate at mine-mouths in an equal number of communities throughout a section of the state.

* * *

Municipal Operation

A comprehensive plan for the development of a municipal power system for Aberdeen, Wash., is indicated in a recent announcement by city officials. The city will buy the power and resell to consumers, four sources being under consideration. All plans call also for construction of a hydro-electric plant on the Upper Wynoochee River. Officials state that the first unit of a projected five-million-dollar plant can be built well within the limit of $2,000,000 set in a bond issue favored by city voters several years ago.

* * *

Power Survey

Prof. V. L. Hollister, of the University of Nebraska engineering faculty, has been engaged by the Middle West Division of the N. E. L. A. to supervise a power survey that a committee has been working for weeks to outline. The survey will cover all power plants in the four states composing the division—Iowa, Kansas, Nebraska, and Missouri.

* * *

Railway Electrification

According to an article in the *Electric Railway Journal,* power for the electrification of the Lackawanna Railroad will be furnished by three New Jersey light and power companies. The power will be supplied through five substations. The project involves 70 miles of route and 160 miles of single track, including main tracks, yards and sidings.

* * *

Rates

Application of the Columbus (Ohio) Railway, Power & Light Company for authority to make a cut of approximately one cent per kw-hr. to domestic and commercial users has been approved by the Utilities Commission, effective Aug. 1.

* * *

Effective from July 1, the Bronx Gas & Electric Company has issued a revised rate for general lighting and power which reduces the number of kilowatt hours in each block, resulting in a marked decrease to the lighting consumer.

* * *

The Municipal Utilities Rate Association of Georgia has been formed by the mayors and other city officials from leading municipalities of the state "to protect the interest of gas and electric consumers."

* * *

Matthew S. Sloan, president of the New York Edison and affiliated electric companies, announced Aug. 15 that the maximum rate of the Yonkers Electric Light & Power Company would be reduced from 10c. a kilowatt hour to 8c., beginning Oct. 1. This will be a 20 per cent cut, making a saving of $200,000 a year for the customers of the company, it is estimated.

* * *

The Maryland Public Service Commission has ordered a $137,500 annual reduction in electric light and power rates on the eastern shore. The order affects the Eastern Shore Public Service Company of Maryland, a subsidiary of the Eastern Shore Public Service Company of Delaware; the Delmarva Power Company, Vienna, Md., and the Consumers Public Service Company, Crisfield.

* * *

Reductions in rates for electric service to customers of the Philadelphia Suburban-Counties Gas & Electric Company, effective Sept. 12, have been announced by William H. Taylor, president. The reductions, approximating $700,000 a year, will apply to residential, commercial lighting and agricultural service on the Eastern, Schuylkill and main line divisions of the company.

* * *

St. Lawrence Project

A memorial has been presented to President Hoover by the Attorneys-General of New York, Ohio, Pennsylvania, Michigan, Minnesota, and Wisconsin, urging him to insist that in developing the Illinois River to complete a deep waterway from Lake Michigan to the Gulf of Mexico, the decision of the United States Supreme Court against transferring water from one watershed to another be strictly observed. The memorial declares that the Sanitary District of Chicago has a plan of improving the Illinois River as a waterway which will cause a much greater diversion than is necessary for sanitation purposes.

* * *

On July 24, at Morrisburgh, Ontario, Governor Roosevelt of New York stated that he would present to the next Legislature definite plans for development of the potential horsepower at International Rapids near Barnhardt Island on the St. Lawrence River. On July 25, Governor Roosevelt completed inspection of the International Rapids section of the St. Lawrence waterway.

* * *

The Institute of Economics of the Brookings Institution of Washington has made public a report holding that the St. Lawrence waterway project is not economically desirable or feasible and estimated the cost of it at $1,000,000,000. The author of the report, nearly 700 pages in length, is Harold G. Moulton, president of the Brookings Institution. Of the billion dollar cost, it is estimated in the report that 614 millions will be assignable to navigation and 385 millions to power development. The annual overhead charges assignable to navigation are calculated at $36,000,000 Extensive analyses of all phases of the project are included in the report.

* * *

A discussion of the proposed St. Lawrence River development was staged Aug. 12 at the Institute of Politics in session at Williamstown College, Williamstown, Mass. Marked differences of opinion were manifest as between Canadian and American speakers, those who represented the United States appearing to share the views recently put forth by investigators for the Brookings Institute at Washington. The United States, it was contended, would have to spend $240,000,000 to help Canada develop 4,000,000 hp. as against 1,000,000 hp. for the United States.

* * *

Taxation

By a vote of 96 to 91, the Georgia House of Representatives voted to table the general sales tax measure and devote its attention to the passage of an income tax bill, which is a companion measure. The bill, which would have imposed a tax of 1 mill on all electricity sold in the state, has thus been temporarily put out of the running. Power companies are not yet in the clear, however, as another bill has been introduced which would place a tax of 5 per cent on all business done by public utility corporations in the state.

* * *

Taxation of Franchises

After a series of hearings, the State Board of Assessment and Equalization of Nebraska has announced that it will tax the various public service companies operating in the state a total of $4,888,812 on their franchises, and in addition has ordered an increase of 10 per cent in their assessed valuation. Only street-car companies are exempted, on the ground that they pay no dividends.

* * *

World Power Conference

The second plenary meeting of the World Power Conference will be held in Berlin from June 16 to June 25, 1930. Berlin was selected by unanimous resolution of the 47 member nations of the conference.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Factors Influencing Railroad Electrification

IN an elaborate report just issued, the Committee on the Electrification of Steam Railroads of the National Electric Light Association, after reviewing the major projects throughout the world, summarizes the immediate factors which influenced various railroad systems to proceed with electrification. These are:

1. The greater economy of electric traction as compared to steam operation in dense traffic territories;
2. The growth of the southern passenger business;
3. The increasing density of both freight and passenger business on our eastern lines and the probability that in the future more rapid movement would be required;
4. The desirability of utilizing the advantages of electric traction in connection with the construction of our new passenger terminals at Philadelphia and Newark;
5. The desirability of building a locomotive that would meet the requirements from the standpoint of weight of train, speed and reliability that we believe will have to be met in this territory in the next twenty years;
6. The probability that the project, if started now, could be completed with a less total expenditure, all matters considered, than if started at a later date.

The Automobile and Electricity

ACCORDING to figures recently published by the National Automobile Chamber of Commerce, the average four cylinder passenger car, operating 11,000 miles per year, uses $144 worth of gasoline and $24 worth of oil and grease per year, a total cost of $168 for fuel and lubricants. This is five and one half times what the average family pays for electric service.

The average six cylinder passenger car used $167 worth of gasoline and $22 worth of oil and grease, or a total of $189. This is more than six times the average annual bill for domestic electricity.

Both the automobile and electric service in the home have passed out of the class of luxuries and are now considered as everyday necessities. Both give enormous values for the consumer's dollar. The automobile has released man from the slavery of fixed transportation schedules, while electric service has contributed immeasurably to the comfort of his home and to the elimination of the old time drudgery of innumerable household tasks. The cost of the latter however, is less than one per cent of the average family budget.

Lighted Airways

ADDITIONAL thousands of miles of 24-hour airways—routes so marked that flying is no longer a dawn-to-dusk enterprise—are to be put in service by the United States Department of Commerce, which is to install 400 additional airway beacons at intervals of ten miles each along the new night routes.

The 24-in. beacons, each of 2,000,000 candlepower, rotate six times per minute. Each tower is equipped with two course lights in addition to the beacon, the lights pointing in the direction of the airway and flashing in code to indicate the number of the beacon along its particular route. If there is no landing field at the beacon, the course lights have red lenses; green lenses are reserved for use at airports and intermediate landing fields.

A National Policy on Water Power

IN a report on the progress of water power development in 1928 just issued the Water Power Development Committee of the National Electric Light Association sets forth concisely the views of the power industry with respect to a national policy on water power. Discussing the outstanding principles which should form the basis for such a policy, the committee says:

"Water power resources should be developed to the fullest extent and in the shortest time possible under the economic conditions that prevail. The greatest benefit from the large water-power developments of the country, such as the St. Lawrence, Tennessee, Columbia, etc., will be the growth and general prosperity of the adjacent territory which will be due to the industrial growth that naturally follows these developments.

"In general, the greatest utilization can be secured for water-power developments when they are part of large utility systems. This is specially true if there are other uses of the water, such as irrigation, navigation and flood control, all of which result in variable rates of output whose inequalities can usually be tolerated in or absorbed by a large interconnected system of steam and water power plants.

"Special charges or taxes assessed against water power development by Federal or State governments limit the extent to which water power can be used to foster industrial development; consequently such charges should not be imposed.

"Regulation by public agency should be provided (as it now is in practically every State) to secure proper service at fair rates to all consumers.

"The Federal Water Power Act in its present form can be administered so as to promote the development of all water power for which a market exists, and it provides ample safeguards for the public interest. Water powers for which no market exists should be withheld from development until economic conditions warrant bringing them into use.

"The tendency to exempt from the jurisdiction of the Federal Water Power Commission any projects over which the Federal Government has jurisdiction is unsound and leads to undesirable delay and inefficiency in the development of feasible water powers."

Trackless Trolleys in Salt Lake City

AUTOMOBILES will not longer be able to get out in the tracks and hold up the trolleys on the Ninth East Street line in Salt Lake City. Trolleys on that route hereafter will be trackless, on rubber tires, and able to maneuver in traffic.

The Utah Light and Traction Company, which already has some trolley buses in service, has been given permission by the city commission and the state public utilities commission to remove the tracks from the Ninth East Street route, pave over the old right-of-way, and supply a considerably speeded service with trolley buses.

The increased acceleration afforded by a new type of control, the greatly decreased weight of the unit, and the ability to maneuver eight or nine feet from the side of the overhead trolley in passing obstructions or reaching the curb, are among the factors contributing to the faster schedule speeds which will be obtained with the new trolley buses.

THE REVIEWING STAND

Suggestion Systems

Serial report, Accident Prevention Committee, Engineering National Section, N. E. L. A. Publication No. 289-112, 28pp., 23 illustrations, 5 tables. Price, 40 cents; to members, 25 cents.

INQUIRY among those who have had to do with a suggestion system has developed the fact that there is no medium better than the suggestion system to bring accident hazards to light, as well as valuable items along many other lines. Moreover, it is the opinion of the Accident Prevention Committee that no channel has as yet been devised equal to it for obtaining the opinions of a large group of employees, and obtaining their cumulative experience which is far better than an equal amount of theorizing.

This report defines a suggestion system as an orderly method for encouraging, receiving and rewarding ideas of employees relative to the business of the employing firms or corporations. Interesting statistics gleaned from studies of reports by two leading universities are set forth in the report. Details of a suggestion system are analyzed and a bibliography is included.

A large portion of the report is devoted to statements of operating companies' experiences with and method of operation of a suggestion system. Various forms used by half a dozen different companies are illustrated.—*E. S. B.*

Uniform Records of Electrical Operation of Power Systems

Serial report, Electrical Apparatus Committee, Engineering National Section, N. E. L. A. Publication No. 289-52 16pp., 14 tables. Price, 30 cents; to members, 20 cents.

THIS report describes typical forms for recording, analyzing and summarizing, on a uniform basis, the electrical operation of power systems under abnormal conditions. In setting forth the purpose of the report, the committee points out that records of interruptions, equipment troubles, operating mistakes, relay performances, etc., have progressed to the point where the practice of several companies may be correlated and set down for the information and suggestive guidance of the industry. This correlation is a stage between description and standardization. There is now sufficient uniformity of definition, methods, and uses as to permit coordination without attempting a standardization that might, at this time, be restrictive to progress, as well as limited in acceptance.

The report deals primarily with the accurate records of system performance under abnormal conditions, including records of interruption to customers.

It is understood that those adopting these records may take such liberties with them as are necessary to fit their respective organizations, but that the essential results will be kept on a uniform basis.

The report has been prepared by the Electrical Apparatus Committee of the Southeastern Division, N. E. L. A., assisted by the Relay Subcommittee of the Protective Devices Committee, A. I. E. E., and by the Operating Practices Subcommittee of the Electrical Apparatus Committee, Engineering National Section, N. E. L. A.—*E. S. B.*

Patrol and Inspection of Transmission Lines

Serial report, Overhead Systems Committee, Engineering National Section, N. E. L. A. Publication No. 289-42, 12pp., 6 illustrations, 5 tables. Price, 25 cents; to members, 15 cents.

THAT periodic patrolling of transmission lines is worthwhile from the standpoint of continuity of service, increased revenue and public safety, is indicated by the information compiled in this report by the Overhead Systems Committee.

Based on a résumé of 105 replies to a questionnaire sent to member companies in this country and Canada the report sets forth the detailed information obtained and analyzes the returns by (a) Geographic Divisions of the Association, (b) Transmission Systems, (c) Time Interval Between Patrolling, (d) Voltages, (e) Method of Transportation, and (f) Miles in the Different Systems that Follow Private Rights-of-ways, Highways and Streets.

Extracts from letters written by two companies in reply to the questionnaire, which are of more than ordinary interest, are included. The report also reproduces specimen field report forms used by several of the companies.—*E. S. B.*

Boilers, Superheaters and Economizers

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-75, 78pp., 12 illustrations, 8 tables. Price, $1.15; to members, 75 cents.

THE variety of boiler plant equipment now available and the rapid succession of new developments constitute at times a source of confusion, both to designing and operating engineers. This report reviews and evaluates some of the most recent developments and attempts to relate important trends of design where possible to certain definite objectives.

The use of increasingly high steam temperatures in central station practice makes the survey of operating practices outlined in the report most valuable. Definite information is given relative to the temperatures in 81 representative stations. The operating results of these stations are presented graphically and in tabulated form. The remainder of the report consists of miscellaneous statements on the following subjects: Circulation in Water-Cooled Furnace Wall Circuits, Steam Generating Capacity of the Water Tube Boiler, Thermal Stresses, Embrittlement in Steam Boilers, Structural Stability of the Steam Boiler, Operation of High-Pressure Cross Cracking Stills, and a statement by the American Uniform Boiler-Law Society.

Nineteen operating companies describe various operating experiences and manufacturers' statements are presented on the following equipment: Boilers and Water Walls, Superheaters, Economizers, Soot Blowers, Baffling Feed Water Regulators, Water Columns and Water Gages, Steam Purifiers, and Valves. A comprehensive bibliography concludes the report.—*E. S. B.*

Promotional Rates

Serial report, Promotional Rates Committee, Commercial National Section, N. E. L. A. Publication No. 289-93, 12pp., 2 illustrations. Price, 15 cents; to members, 10 cents.

THIS report emphasizes the desirability of more standardization of form in rates and reviews the various types of rates now in use, including Straight Line Meter Rate, Step Meter Rate, Block Meter Rate, Flat Demand Rate, Service Charge Rate, Wright Demand Rate, Block Hopkinson Demand Rate, Three Charge or "Doherty" Rate, Floor Area Rate, and Room Rate Charge.

Report of the Committee on Public Utility Rates, 1927, National Association of Railroad and Utilities Commissioners, is quoted in part and concludes the report.—*E. S. B.*

Educational Committee

Serial report of the Educational Committee, N. E. L. A. Publication No. 289-122, 20pp., 11 illustrations. Price, 30 cents; to members, 20 cents.

A REVIEW of the Educational Committee's work for the year is given in this report along with a brief description and outline of the courses offered by this committee. A sample page from each of the various courses is illustrated.

The review of the year's work shows

that a total of 3379 of the various courses now offered by the Committee were distributed, as against 2197 for the previous year, an increase of 54 per cent. It is pointed out that this increase was due largely to the meter courses conducted by the Engineering National Section. No doubt a much larger distribution could be obtained if all member companies were familiar with the advantages of using these courses and would formulate some definite plan of employee education as already adopted by a large number of member companies.—*E. S. B.*

The Electric Farm Equipment Market

Serial report, Merchandise Sales Committee, Commercial National Section, N. E. L. A. Publication No. 289-92, 12pp., 1 illustration, 6 tables. Price, 25 cents; to members, 15 cents.

THE merchandising problem involved in the question, "How to build the load on the farm?" is thoroughly analyzed in this report of the Merchandise Sales Committee. It is pointed out that since farm electrification is a new development in the electrical utility business, it calls for specialized attention, and that specialized men are required to handle it. Among the fundamental recommendations made in this report is that rural electrification activity be divided into two parts, namely, (1) rural service development or new business development, (2) actual selling of farm electric equipment.

Sales repirements, what, when and how to sell, and the analysis of available data are subjects dealt with in the report. A large amount of statistical information is available which, when digested, analyzed and summarized, will yield important information for the merchandising manager and salesmen. A method of doing this is demonstrated, a compilation of available data made by the Rural Electric Service Department and the Rates Statistical Department of the Northern States Power Company, Minneapolis, Minn., being analyzed in detail for two of the thirteen divisions of the company.—*E. S. B.*

Automatic Train Control Installations and Description of the Code System

Serial report, Inductive Coordination Committee, Engineering National Section, N. E. L. A. Publication No. 289-95, 17pp., 3 illustrations. Price, 30 cents; to members, 20 cents.

CONSIDERABLE progress has been made in the development of automatic train control during the past two years. The most outstanding development of interest from an inductive coordination standpoint, the installation of the Code System of Automatic Train Control, is described in this Serial Report prepared by the Train Control Subcommittee. The operation of this system is based upon a fundamental frequency current in the rails interrupted at various regular intervals to produce the desired signals in the locomotive cab by induction from the current in the rails.

In addition, the report shows the present status of the installation of automatic train control systems.—*E. S. B.*

DC Substation Design Practice

Serial report, Electrical Apparatus Committee, Engineering National Section, N. E. L. A. Publication No. 289-82, 90pp., 157 illustrations, 2 tables. Price, $1.50; to members, $1.00.

THIS report presents in a condensed form the principal features of design of twenty-seven direct-current substations supplying Edison or railway loads. The data are presented along the general lines found useful in two preceding reports on alternating-current substation design, "A. C. Substation Design Practice," Publication No. 25-44, issued in July, 1925, and "A. C. Substation Design Practice—1927," Publication No. 278-39, issued in April, 1928.

The report is divided into four sections: (1) Automatic Edison Substations, (2) Non-Automatic Edison Substations, (3) Automatic Railway Substations, and (4) Non-Automatic Railway Substations.

Included in the report are simplified plans, cross-sections, single line diagrams, cuts of electrical equipment and building exteriors, and tabulations of substation details.—*E. S. B.*

Training for Better Public Contact

Serial report, Industrial Relations Committee, Public Relations National Section, N. E. L. A. Publication No. 289-108, 8pp. Price, 15 cents; to members, 10 cents.

THIS is the final of a series of four reports of the Industrial Relations Committee, prepared by the Public Contact Training Subcommittee dealing with the subject "Training for Better Public Contact." The preceding report of the series, Publication No. 289-83, outlined the various steps involved in the training program from the time it is proposed until the time it is actually inaugurated, and this report applies the principle of testing or measurement of the personal service which employees give to customers which is entirely consistent with the well-established practice of testing physical equipment, and measuring service and production. The report classifies the methods of measuring results now in use and the application of these methods.

The relation of measurement to the training program is discussed in the latter part of the report, along with recommendations of the Committee.—*E. S. B.*

State and Municipal Regulation of Radio Communication

By Paul M. Siegal and Paul D. P. Spearman of the Legal Division, Federal Radio Commission. Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 10 cents.

A PAMPHLET reviewing the present status of State and municipal regulation of radio interference has been issued by the Federal Radio Commission.

General Counsel Bethuel M. Webster, Jr., in his foreword points out that —"In a new field of jurisprudence there is occasion for proceeding thoughtfully and deliberately. This is specially true of radio regulation, which must be based on a recognition of sound engineering as well as legal principles. In response to numerous requests for guidance and information, the members of the Legal Division of the Commission feel an obligation to transmit the fruit of their experience to less experienced persons engaged in the formulation of regulatory measures."

The authors have outlined the proper scope of local regulation as viewed by the Federal Radio Commission and have indicated some of the mistakes, both of policy and of law, which have been innocently incorporated in State statutes and municipal ordinances.

Six Words in an Accountant's Life

(*Continued from page* 592)

treatise, it is not the least important. As a usual thing, when the word personality is used, we think of it in the terms used by "Charlie" Schwab—geniality—pleasantness and good fellowship. Certainly, these are admirable traits for which all gentlemen should strive, but it is not in this sense that I desire to treat the word here. I mean the development of personality in the sense that it is unselfish, that it is willing to be of service to others, that it is willing to spend itself to advance the art and science of the production, distribution and use of electrical energy for public service. A personality that recognizes, as do men of the type of Whitney and Langmuir, that we owe to those who have preceded us in our walks of life, the duty of being part of the changes that are taking place in this workaday world—A personality that will grasp the wisdom, the optimism and the truth contained in the thought of Emerson's "Work Is God's Greatest Gift to Man."

R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Henry G. Bradlee, Stone & Webster, Inc., Boston, Mass.

N. F. Brady, The New York Edison Co., New York, N. Y.

B. C. Cobb, Allied Power & Light Corp., New York, N. Y.

Frank L. Dame, The North America Co., New York, N. Y.

J. E. Davidson, Nebraska Power Co., Omaha, Neb.

Henry L. Doherty, Henry L. Doherty & Co., New York, N. Y.

Alex Dow, The Detroit Edison Co., Detroit, Mich.

Charles L. Edgar, The Edison Electric Illuminating Co., Boston, Mass.

Halford Erickson, Byllesby Engineering & Management Corp., Chicago, Ill.

John F. Gilchrist, Commonwealth Edison Co., Chicago, Ill.

P. G. Gossler, Columbia Gas & Electric Corp., New York, N. Y.

A. R. Graustein, International Paper Co., New York, N. Y.

Franklin T. Griffith, Portland Electric Power Co., Portland, Ore.

C. E. Groesbeck, Electric Bond & Share Co., New York, N. Y.

Edwin Gruhl, The North American Co., New York, N. Y.

A. F. Hockenbeamer, Pacific Gas & Electric Co., San Francisco, Cal.

Martin J. Insull, Middle West Utilities Co., Chicago, Ill.

Samuel Insull, Commonwealth Edison Co., Chicago, Ill.

W. A. Jones, Cities Service Co., New York, N. Y.

John W. Lieb, The New York Edison Co., New York, N. Y.

Thomas W. Martin, Alabama Power Co., Birmingham, Ala.

Thomas N. McCarter, Public Service Electric & Gas Co., Newark, N. J.

John B. Miller, Southern California Edison Co., Los Angeles, Cal.

Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

J. J. O'Brien, H. M. Byllesby & Co., Chicago, Ill.

J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. Pack, Northern States Power Co., Minneapolis, Minn.

A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

H. T. Sands, Electric Bond & Share Co., New York, N. Y.

Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. Sloan, The New York Edison Co., New York, N. Y.

Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

R. P. Stevens, Allied Power & Light Corp., New York, N. Y.

Frank M. Tait, The Dayton Power & Light Co., Dayton, Ohio.

George N. Tidd, American Gas & Electric Co., New York, N. Y.

Herbert A. Wagner, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

Owen D. Young, General Electric Co., New York, N. Y.

John E. Zimmermann, The United Gas Improvement Co., Philadelphia, Pa.

Public Relations National Section Representatives

(To be appointed)

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary,* H. M. Lyster, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State* [*Provincial*] *Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, Charles S. Ruffner, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary,* Charles H. B. Chapin, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. Howell, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary,* S. F. Delany, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, L. B. Herrington, Kentucky Utilities Co., Louisville, Ky.; *Secretary-Treasurer,* D. L. Gaskill, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary,* E. F. Kelley, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary,* A. Bliss McCrum, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, G. C. Neff, Wisconsin Power & Light Co., Madison, Wis.; *Secretary,* Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, E. F. Kelly, Central Illinois Public Service Co., Springfield, Ill.; *Secretary-Treasurer,* George W. Schwaner, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association

President, C. V. Sorenson, Central Indiana Power Co., Indianapolis, Ind.; *Secretary-Treasurer,* William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, E. L. Edward, Michigan Electric Power Co., Lapeer, Mich.; *Secretary-Treasurer,* Herbert Silvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, G. W. Van Derzee, Milwaukee Electric Railway & Light Co., Milwaukee, Wis.; *Executive Secretary,* John N. Cadby, 502 Brumder Bldg., 105 Wells St., Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary,* D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary,* A. B. Tunis, 301 East Grace Street, Richmond, Va.

Middle West Division

(Iowa, Kansas, Missouri, Nebraska)

President, A. E. Bettis, Kansas City Power & Light Co., Kansas City, Mo.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Managing Director,* Joe Carmichael, 310 Crocker Bldg., Des Moines, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. Lee Jones, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, T. J. Strickler, Kansas City Gas Co., Kansas City, Mo.; *Secretary-Treasurer,* F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director,* Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

New England Division

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, C. H. Hodskinson, The Edison Electric Illuminating Co., Boston, Mass.; *Secretary,* Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

North Central Division

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, Thomas T. Parker, Northwestern Public Service Co., Huron, S. D.; *Secretary,* John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

Northwest Division

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, M. L. Hibbard, Idaho Power Co., Boise, Idaho; *Secretary,* Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

Pacific Coast Division

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, E. B. Criddle, Southern Sierras Power Co., Riverside, Cal.; *Secretary,* Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

Rocky Mountain Division

(Colorado, New Mexico, Wyoming)

President, W. D. Johnston, Mountain States Power Co., Casper, Wyo.; *Secretary,* O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, H. S. Robertson, Denver Tramway Corp., Denver, Colo.; *Secretary,* O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

Southeastern Division

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, T. H. Tutwiler, Memphis Power & Light Co., Memphis, Tenn.; *Secretary,* C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

Southwestern Division

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, Fred W. Insull, Public Service Co. of Oklahoma, Tulsa, Okla.; *Secretary,* S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, Thomas R. Weymouth, Oklahoma Natural Gas Corp., Tulsa, Okla.; *Secretary,* Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Oyla.

Southwestern Public Service Association

President, Knox Lee, Southwestern Gas & Electric Co., Marshall, Tex.; *Secretary,* E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

Special National Committees

Advertising Committee—(To be determined.)

Charles A. Coffin Prize Committee—M. S. Sloan, The New York Edison Co., New York, N. Y.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World,* New York, N. Y.

Public Policy Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Buffalo, N. Y.

Wiring Policy Committee—J. E. Davidson, Nebraska Power Co., Omaha, Neb.

General National Committees

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Stevens & Wood, Inc., New York, N. Y.

***Membership Committee**—A. Jackson Marshall, National Electric Light Association, New York, N. Y.

***Rural Electric Service Committee**—Eugene Holcomb, Consumers Power Co., Jackson, Mich.

Accounting National Section

***Section's Executive Committee**—W. R. Emerson, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Budget Committee—B. F. Rodey, The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. Hasbrouck, C. H. Hopson & Co., New York, N. Y.

***Customers' Records Committee**—E. W. Korsmeyer, Henry L. Doherty & Co., New York, N. Y.

Exhibit Committee—T. A. Wallace, Henry L. Doherty & Co., New York, N. Y.

***Fixed Capital Committee**—Thomas M. Ford, The Philadelphia Electric Co, Philadelphia, Pa.

***General Records Committee**—C. E. McBride, Electric Bond & Share Co, New York, N. Y.

***Purchasing and Storeroom Committee**—K. C. Campbell, The Detroit Edison Co., Detroit, Mich.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

Commercial National Section

***Section's Executive Committee**—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio

General Power Committee—H. C. Thuerk, Associated Gas & Electric System, New York, N. Y.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—M. E. Skinner, New York Power & Light Corp., Albany, N. Y.

Commercial and Industrial Lighting Committee W. H. Horton, Jr., West Penn Power Co., Pittsburgh, Pa.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—Frank A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—(Not determined).

Refrigeration Committee—(Not determined).

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

Engineering National Section

***Section's Executive Committee**—A. D. Bailey, Commonwealth Edison Co., Chicago, Ill.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—R. A. Hentz, The Philadelphia Electric Co., Philadelphia, Pa.

Engineering Administration Committee—W. E. Mitchell, Georgia Power Co., Atlanta, Ga.

Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co., Detroit, Mich.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co, Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co, Atlanta, Ga.

***Meter Committee**—A. S. Albright, The Detroit Edison Co, Detroit, Mich.

***Overhead Systems Committee**—Sydney Alling, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World,* New York, N. Y.

***Prime Movers Committee**—R. D. DeWolf, The Rochester Gas & Electric Corp., Rochester, N. Y.

***Underground Systems Committee**—G. C. McCabe, The Detroit Edison Co., Detroit, Mich.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—HARRY REID, National Electric Power Co., New York, N. Y.

***Cooperation with Educational Institutions**—JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—(To be determined.)

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—CHARLES B. STUART, Halsey Stuart & Co., New York, N. Y.

***Women's Committee**—MISS SARA HARRIS, Utica Gas & Electric Co., Utica, N. Y.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

September

2–4 Colorado Utilities Association, Glenwood Springs, Colo.

2–4 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs, Colo.

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 *American Society for Steel Treating, Cleveland, Ohio.*

9–14—*Association of Edison Illuminating Companies, Quebec, Canada.*

18 Rural Electric Service Committee, Room 1740, Edison Bldg., Chicago, Ill.

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

23 9.30 a. m., Women's Committee, Drake Hotel, Chicago, Ill.

23 Executive Committee, Accounting National Section, Palmer House, Chicago, Ill.

23 Customer Ownership Committee, Edison Bldg., Chicago, Ill.

24 Executive Committee, Public Relations National Section, Room 1741, Edison Building, Chicago, Ill.

24 Insurance Committee, Room 1742, Edison Bldg., Chicago, Ill.

24–27 *Illuminating Engineering Society, Bellevue-Stratford Hotel, Philadelphia, Pa.*

25 National Executive Committee, Room 1741, Edison Building, Chicago, Ill.

26–28 Great Lakes Geographic Division, French Lick Springs, Ind.

28–29 Industrial Relations Committee, Rooms 7 and 8, Palmer House, Chicago, Ill.

28–30 *American Electric Railway Association Convention and Exhibit, Municipal Auditorium, Atlantic City, N. J.*

30 *National Safety Council, Stevens Hotel, Chicago, Ill.*

30 Hydraulic Power Committee, William Penn Hotel, Pittsburgh, Pa.

30 Overhead Systems Committee, William Penn Hotel, Pittsburgh, Pa.

30 Power System Engineering Committee, William Penn Hotel, Pittsburgh, Pa.

30 Prime Movers Committee, William Penn Hotel, Pittsburgh, Pa.

October

1 Executive Committee, Engineering National Section, William Penn Hotel, Pittsburgh, Pa.

1 Hydraulic Power Committee, William Penn Hotel, Pittsburgh, Pa.

1 Overhead Systems Committee, William Penn Hotel, Pittsburgh, Pa.

1 Power System Engineering Committee, William Penn Hotel, Pittsburgh, Pa.

1 Prime Movers Committee, William Penn Hotel, Pittsburgh, Pa.

1–2 Accident Prevention Committee, William Penn Hotel, Pittsburgh, Pa.

1–4 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

1–4 *National Safety Council, Stevens Hotel, Chicago, Ill.*

2–3 Electrical Apparatus Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Inductive Coordination Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Meter Committee, William Penn Hotel, Pittsburgh, Pa.

2–3 Underground Systems Committee, William Penn Hotel, Pittsburgh, Pa.

7–10 *Third National Fuels Meeting, American Society of Mechanical Engineers, Bellevue-Stratford Hotel, Philadelphia, Pa.*

7–11 *National Electrical Manufacturers Association, Wardman Park Hotel, Washington, D. C.*

10–12 Third Annual Conference for Rural Service Men of Electric Light and Power Companies, Agricultural Experiment Station, Purdue University, Lafayette, Ind.

14–18 *American Gas Association, Atlantic City, N. J.*

17–18 Kansas Section, Wichita, Kan.

22 *The Electric Association, Chicago, Ill.*

22 Public Policy Committee, Edison Building, Chicago, Ill.

22 Public Policy Committee, Edison Bldg., Chicago, Ill.

23–24 Public Utilities Association of West Virginia, Wheeling, W. Va.

November

21–22 Public Utilities Association of Virginia, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

December

2–4 Secretaries' Conference, Drake Hotel, Chicago, Ill.

NEW MEMBERS

Light and Power Companies, Employees of Light and Power Companies, Invited Persons, Manufacturing Companies, Employees of Manufacturing Companies, Associated Companies, Employees of Associated Companies and Foreign Organizations who have recently become Members of the National Electric Light Association.

NOTE: Names of new individual members are shown in the following order: First, in italics, post office address of company employing new members, and on the same line, in Roman letters, the name of the company employing new members; on succeeding indented lines, names of new members followed by post office address.

Electric Light and Power Companies (Class A)

Massachusetts, Huntington, Huntington Electric Light Co.

New Mexico, Gallup, New Mexico Public Utilities Corporation

Employees of Electric Light and Power Companies (Class B)

California, Fresno, San Joaquin Light & Power Corporation
  M. E. Parsell
  Howard Sullivan (Clovis, Cal.)
California, Los Angeles, Los Angeles Gas & Electric Corp.
  M. A. Seeley
California, Los Angeles, Southern California Edison Company
  Miss Helen McMillan (Montebello, Cal.)
  Miss Alice Smith
  Mrs. Phylis Vauchlet (Glendale, Cal.)
California, Santa Cruz, Coast Counties Gas & Electric Company
  J. C. Barrington
  R. L. Vaughn (San Francisco, Cal.)
  Pierre Vinet
California, San Francisco, Great Western Power Company
  William K. Cullen
  S. J. Sherman (Napa, Cal.)
California, San Francisco, Pacific Gas & Electric Company
  A. R. Gledhill (Marysville, Cal.)
  Miss Mildred Hinrichs (Salinas, Cal.)
  Jas. R. Johnson (Placerville, Cal.)
  C. O. Phillips (San Jose, Cal.)
Illinois, Chicago, Bayfield Utilities Company
  Roy H. Okerstrom
Illinois, Chicago, Commonwealth Edison Company
  Miss Catherine A. McGuire
Illinois, Peoria, Central Illinois Light Company
  John T. Englis (Farmington, Ill.)
  J. Dale Frame (Elmwood, Ill.)
  Frank R. Kice (Washington, Ill.)
Indiana, Hammond, Northern Indiana Public Service Company
  William L. Lundy (East Chicago, Ind.)
  M. F. North (Fort Wayne, Ind.)
Indiana, Kokomo, Northern Indiana Power Company
  L. J. Evans (Wabash, Ind.)
Iowa, Dubuque, Interstate Power Company
  S. A. Jordan (Rochester, Minn.)
  Leonard Peterson (Crookston, Minn.)
Massachusetts, Brockton, Edison Electric Ill'g Co. of Brockton
  Miss Dorothy E. Johngren
Michigan, Detroit, The Detroit Edison Company
  Russell Fims
  E. O. George
  Neil Hollinger (Port Huron, Mich.)
Minnesota, Duluth, Minnesota Power & Light Co.
  C. R. Bailey
  C. C. Boswell
  J. E. Lynch
Minnesota, Fergus Falls, Otter Tail Power Company
  Thomas C. Wright
Minnesota, Minneapolis, Montana-Dakota Power Company
  W. L. Hayes
Minnesota, Minneapolis, Northern States Power Company
  Paul D. Austin
  O. C. Bieging (Stillwater, Minn.)
  Carl T. Bremicker (St. Paul, Minn.)
  Wm. H. Brown
  V. E. Engquist
  S. E. Hinkel (White Bear Lake, Minn.)
  George A. Hult (Sioux Falls, S. D.)
  E. J. LeBlond (St. Paul, Minn.)
  A. L. McIntyre (Stillwater, Minn.)

E. M. Morris (Minot, N. D.)
E. J. Niedekorn (Wabasha, Minn.)
M. J. Perkins (Mankato, Minn.)
E. C. Perschman
George H. Richardson (St. Cloud, Minn.)
S. S. Robinson (St. Croix Falls, Wis.)
H. W. Rugg (St. Paul, Minn.)
B. F. Smith
R. E. Steele
Elmer Swanson (Montevideo, Minn.)

New Hampshire, Portsmouth, New Hampshire Gas & Electric Company
Miss Sally Crockett
Miss Florence H. Norton

New Jersey, Newark, Public Service Electric & Gas Company
Bertil P. Dahlstrom
Bernard W. Mohring (Jersey City, N. J.)
Martin J. Newman

New York, Bronx, Bronx Gas & Electric Company
Edward De Graaf (New York, N. Y.)
William P. Jackson (New York, N. Y.)
Miss Florence Peters (New York, N. Y.)
M. A. Sippel (New York, N. Y.)

New York, Brooklyn, Brooklyn Edison Company, Inc.
Adolph Fibel
John F. Lambias, Jr.
Fred W. Young

New York, Mt. Vernon, Westchester Lighting Company
Edward F. Marr (White Plains, N. Y.)

New York, New York, Electric Bond & Share Company
Roger S. Coolidge
Paul L. Heslop

New York, New York, The New York Edison Company
Louis Frank Falkenstein (Astoria, N. Y.)
Eric Martin While
J. C. Ziegfield (Long Island City, N. Y.)

New York, New York, United Electric Light & Power Co.
Paul Clement Dupre
Lewis E. Wolfram

New York, Long Island City, New York & Queens Electric Light & Power Co.
P. F. Ankers (Jackson Heights, N. Y.)
Wm. Creel Aycock (Flushing, N. Y.)
George R. Barnet (Flushing, N. Y.)
Norman D. Bartlett (Woodside, N. Y.)
William H. Bossert (Jamaica, N. Y.)
Frank P. Cavello
James E. Chaplin (Flushing, N. Y.)
Walter Christian (Flushing, N. Y.)
Samuel N. Courtney (Woodhaven, N. Y.)
Floyd L. Dapson (Flushing, N. Y.)
Thomas C. Duncan (Flushing, N. Y.)
W. Francis Dunn (Flushing, N. Y.)
Russell L. Funk (Brooklyn, N. Y.)
Herbert B. Guckel (Elmhurst, N. Y.)
Harold J. Hardiman (Ridgewood, N. Y.)
John L. Hayward (Flushing, N. Y.)
Daniel Ihasz (Elmhurst, N. Y.)
Herbert C. Jonas (Flushing, N. Y.)
James Keogh (Brooklyn, N. Y.)
Geo. W. Kinder (St. Albans, N. Y.)
Fred J. Krampert (Queens Village, N. Y.)
Henry Kurtz (New York, N. Y.)
Creston F. Laager (Flushing, N. Y.)
Edmund Lazard (Richmond Hill, N. Y.)
Charles F. Lingle (Woodside, N. Y.)
Thomas Lyons (Elmhurst, N. Y.)
Arthur McSheffrey (Forest Hills, N. Y.)
James G. Meenahan (Woodhaven, N. Y.)
John J. Mehrtens (Edgemere, N. Y.)
James J. Mohen (Woodside, N. Y.)
Paul Mrstik (Elmhurst, N. Y.)
Thomas J. Noonan (Jackson Heights, N. Y.)
Victor Novarino (New York, N. Y.)
James L. O'Dowd (Flushing, N. Y.)
Joseph J. O'Leary (Flushing, N. Y.)
James H. Pim (Flushing, N. Y.)
Ernest L. Plant (Flushing, N. Y.)
Marion F. Raines (Richmond Hill, N. Y.)
Edmund H. Scheick (Woodhaven, N. Y.)
Edwin A. Sherman (Richmond Hill, N. Y.)
John F. Sorosick (Oyster Bay, N. Y.)
Herbert H. Stauss (Brooklyn, N. Y.)
Joseph H. Steinbach (Flushing, N. Y.)
John W. Sweeney (New York, N. Y.)
Maurice J. Van Biene (Brooklyn, N. Y.)
Roger E. Warden (Flushing, N. Y.)
Miss Kathryn Yula (Whitestone, N. Y.)

New York, Niagara Falls, The Niagara Falls Power Company
Earl B. Strowger

New York, Poughkeepsie, Central Hudson Gas & Electric Company
F. M. Greene (Wappingers Falls, N. Y.)
Ernest W. Hover
William B. Lee
C. I. Richards
R. Raymond Ricket (Rhinebeck, N. Y.)

Oregon, Portland, Portland Electric Power Company
Verne Hansen
L. A. Kallen
Norman B. Whittier

Pennsylvania, Allentown, Pennsylvania Power & Light Company
Morris Oppenheim (Harrisburg, Pa.)
Richard J. Prince

Pennsylvania, Oil City, Keystone Public Service Company
Jos. Riesenman, 3rd (Franklin, Pa.)

Pennsylvania, Pittsburgh, West Penn Power Company
H. E. Burcher
Donald D. Dalrymple
Charles L. Goodman, Jr.

Pennsylvania, Reading, Metropolitan Edison Company
Leo S. Hay

South Carolina, Charleston, South Carolina Power Company
Dean H. Davis
R. A. Easterling (Denmark, S. C.)
H. H. Higgins
C. B. McCleary
Miss Gene Seel
C. D. Smith
L. C. Waring, Jr.
C. C. West

South Dakota, Huron, Northwestern Public Service Company
E. W. Dempewolf (Redfield, S. D.)

Tennessee, Chattanooga, Southern Cities Power Company
Edward L. Fortin (Philadelphia, Pa.)

Washington, Spokane, Washington Water Power Company
Miss Edith L. Hedger

Wisconsin, Amery, Wisconsin Hydro-Electric Company
F. P. Hyer

Wisconsin, Madison, Wisconsin Power & Light Company
Richard T. Perry

Canada, N. B., Grand Falls, Saint John River Power Co.
A. H. Tweedie, Esq.

Employees of Manufacturing Companies (Class E)

Connecticut, Bridgeport, Bryant Electric Company
J. A. Gibson (Montreal, Quebec, Canada)

Illinois, Chicago, Curtis Lighting, Inc.
P. M. Rutherford, Jr. (Atlanta, Ga.)

Massachusetts, Ashland, Warren Telechron Company
Guy Cooper (Los Angeles, Cal.)

Massachusetts, Boston, Walker & Pratt Mfg. Co.
J. L. White (Seattle, Wash.)

Michigan, Bay City, Kuhlman Electric Company
Roy C. Young

Michigan, Detroit, Kelvinator Corp.
H. A. Dahl (Minneapolis, Minn.)

Missouri, St. Louis, Wagner Electric Corporation
Malcolm E. Cundall (Seattle, Wash.)
Raymond M. MacPherson (Portland Ore.)

New Jersey, Harrison, Edison Lamp Works of G. E. Co.
D. Axman (Chicago, Ill.)

New York, New York, Graybar Electric Company
Martin Buehler (Minneapolis, Minn.)
Earl Sharpe (Minneapolis, Minn.)

New York, New York, Habirshaw Cable & Wire Corporation
Edw. J. Jeep (St. Louis, Mo.)

New York, New York, Johns-Manville Corporation
C. L. Buratti (Los Angeles, Cal.)

New York, New York, The Okonite Company
T. T. Kennedy (San Francisco, Cal.)

New York, New York, Safety Cable Company
Allen D. Pettee

New York, New York, Westinghouse Lamp Company
M. H. Anderson (Minneapolis, Minn.)
Ralph Neumuller

New York, Schenectady, General Electric Company
Thurber Day (Minneapolis, Minn.)
W. C. Goughmour (Chicago, Ill.)
Paul B. Reed (Minneapolis, Minn.)
W. C. Whitaker (Riverside, Cal.)

Ohio, Cleveland, Electric Vacuum Cleaner Co.
P. E. Dempsey (Minneapolis, Minn.)

Ohio, Dayton, Frigidaire Corporation
W. A. Allen (Oakland, Cal.)

Investment Merit

(*Continued from page* 589)

further operating economies through engineering development, and cooperative achievement of operating companies.

Financial organization of Electric Utility Companies demands continual appeal to investors for funds bringing about a wide market for securities. Stability of earning power assures safety of capital. The record of management has been one of successful achievement.

Regulation by state utility commissions assures proper financing and adequate but not excessive rates. Possibility of an increasing degree of regulation by individual states seems imminent, but not to the investor's disadvantage. Such regulation should minimize the possibility of development of any financial weakness or irregularity of management in the industry, and tend to eliminate agitation for Federal control and Government ownership.

Confidence in the industry is evidenced by the large numbers of customers and employees who have subscribed to stock issues, and recognition of certain classes of securities for legal investment establishes high investment rating. Stock issues have been in such demand that at times securities of some companies have been out of line with reasonable prices, established on apparent intrinsic values, but inherently the industry is sound, and such overpricing merely represents an expression of the investor's faith in the future. Management will undoubtedly further the industry's success in so conducting operations and directing policies that capital will continue to be attracted on a favorable basis.

Guide to This Issue

General

Consolidations in the Electric Utility Industry, 629

M. S. Sloan

The public will not accept this development in our business on the sole basis that it is necessary and good for us. It will be accepted only as it is proved to be good for the public also.

Behind the Veil: Corralling the Incandescent Lamp, 632

Ernest Greenwood

The genesis of the incandescent lamp. The author shows conclusively that claims to priority over Edison in the invention of the commercially practicable lamp are baseless. This is the seventh of a series of articles which portray against a social-historic background the evolution of the electrical industry, and the chief personalities that have been instrumental in its growth.

Constructively Iconoclastic or—Iconoclastically Constructive? 638

Amplifier

Two breeds of iconoclasts—those who would destroy the substance in their search for a doubtful shadow, and those who build better before destroying the old.

The Electric Water Heater, 641

H. Geo. D. Nutting

James H. McGraw Prize Award Paper. A compilation of theoretical and practical experience with electric water heaters. No attempt has been made to cover all of the ground, but rather the reader is given enough information to interest him in starting investigations of his own, to the end that the electric water heater may come into its own as a revenue producer as a service to the public.

Another Anniversary, 650

John W. Lieb

The opening of the Pearl Street Station in New York.

1879 and Now, 651

S. E. Doane

Light's Golden Jubilee and our tribute to Thomas Alva Edison.

Depreciation Accounting Methods for Public Utilities, 653

L. R. Nash

This paper deals with that part of the broad subject of depreciation which relates to the method of accumulating adequate reserves through which to retire property that ceases to be useful. The two major systems of accounting, i.e., the Interstate Commerce Commission and the Uniform System for State Commissions, are contrasted and discussed.

The Flexible Cord Problem, 661

Arthur P. Good

The light and power company's attitude toward the use of flexible cords as interpreted by the Chairman of the Wiring Sales Committee, N.E.L.A.

A Friendly Neighbor in a Time of Need, 664

J. B. Mahoney

An electric light and power company rushes to provide water for a drought suffering section.

National Executive Committee Meeting, 665

1930 Convention will be held the week of June 16 in San Francisco
Digest of the Executive Committee Meeting.

Obituary, 666

Pay Bills Here, 667

H. T. East

Of all employees of public utility companies, the Cashiers have one of the most difficult contact problems. By the same token theirs is the greatest opportunity to promote good-will and make friends for themselves and their company by handling their jobs in a manner which will please the many patrons whom they face in their daily routine.

THE PRESIDENT'S PAGE

Looking Back

IN our celebration of Light's Golden Jubilee there has passed almost unnoticed another anniversary of an event of major importance in our industry.

On September 4, 1882, Edison's Pearl Street generating plant in New York City was opened to public service.

Ours is a forward-looking, forward-striding industry, but there is a tremendous inspiration in looking back to that event. Looking back implies having reached a point to look back FROM. The progress of our industry from 1882 to 1929—only 47 years—is nothing short of astounding.

Generators in that station were rated at 125 H.P. Today there are in use turbo-generators of 210,000 H.P., with bigger ones building. The total generating capacity of the central station in the country is about 38,000,000 H.P. We have 132,000 volt underground cables and 220,000 volt overhead lines. We have interconnected transmission systems covering states and groups of states.

The Pearl Street Station started with 59 customers whom it served free for several months. Our industry now has 24,000,000 or more customers. It doesn't serve them free, but it has a record of steadily lowering prices.

Technical improvements, commercial enterprise and those steadily lowering prices have made electric service so essential in homes, stores and factories that our country uses as much as all the rest of the world. Our nation's industrial supremacy and high standards of living are based on electrical power.

Pearl Street was a beginning. We have progressed far in a short time. Yet what the industry has done up to now is only a good beginning of its ultimate usefulness. Our pride in present accomplishments should only stimulate our zeal for greater accomplishment in future.

MSSloan

President.

The Electric Water Heater

WITH each new investigation of the characteristics of the Electric Water Heater, the great possibilities of this device as a load builder become more and more evident. The studies upon which present day practice in this field are based have been conducted largely by individual companies. In some instances, the companies have followed a definite plan, investigating the possibilities from the standpoint of central stations, while in others, the work has been delegated to individuals within the company who have been empowered to investigate all phases of the subject. Both methods have definite advantages and both have yielded results of extreme value to the industry.

A concrete example of what can be done by an individual is the investigation conducted by Mr. H. Geo. D. Nutting, of the Detroit Edison Company, and described in his paper entitled "The Electric Water Heater," which appears in this issue. This paper was selected for the McGraw Prize Award as one of the three best papers on any engineering or technical subject relating to the Electric Light and Power Industry. It well deserves this distinction as Mr. Nutting has tackled the problem with the utmost sincerity and has made a definite contribution to the existing knowledge on the subject. Mr. Nutting's paper represents his personal contribution to the industry and, to quote, ". . . the writer's conclusions are not to be interpreted as" those of the Detroit Edison Company, by whom he is employed, nor those of the N. E. L. A. Water Heating Committee, of which he is a member and which is now actively engaged in investigating electric water heating on a national basis.

In this connection one of the representatives of the committee has just completed a 10,000 mile trip, the results of which are most gratifying as a wealth of data has been collected. The investigations of the individual companies which have heretofore been available to only a few will now be accessible to all. These data, as well as a large amount from foreign countries, are being carefully digested with a view to producing a single complete picture out of a multitude of units.

The basic factors which are still indefinite and which are of utmost importance are (1) the diversity and (2) the load factor of the various types. Arrangements for tests to determine these have been completed and tests are already under way in Seattle. The magnitude of the task undertaken by the committee becomes evident only when we recall that each of these tests involves the installation of instruments on approximately 100 heaters and many thousand calculations to obtain the final results, as well as the fact that to be truly representative the tests must be made on several types of heaters under different climatic conditions. This is all necessary for a complete picture, and how much more valuable is the complete picture than the isolated sections.

Edison's Lamp

IN the seventh of his articles appearing under the main title of "Behind the Veil," Mr. Ernest Greenwood has provided an account of the genesis of the incandescent lamp which, in addition to being a valuable contribution to the popularization of the subject, should do much towards correcting any misunderstanding of the reasons for the World-wide celebration of Light's Golden Jubilee.

To many it may appear odd that there is any need for explanation. Yet, when a work so carefully assembled and so scrupulously edited as the Encyclopedia Britannica can credit Sir Joseph Swan as the inventor of the first practical incandescent lamp, it is not surprising that some of our English friends feel that the honors that are being shown Mr. Edison properly belong to, or at least should be shared with Sir Joseph. Swan's contributions to electrical development were of the highest order, and he is indubitably entitled to a deal of credit for his work, yet the fact remains that he cannot be properly ascribed as the inventor of either the first incandescent lamp or the first commercially practical lamp.

To De la Rue goes the honor of inventing the first experimental incandescent lamp, in 1820. Between that date and the time of Edison's historic demonstration of Oct. 21, 1879, a number of other experimenters had produced incandescent lamps of various types. However much the lighting art may owe to this pioneering work, the inescapable truths stand out that none of these lamps was capable of commercial development; none was more than a laboratory experiment; and that Edison demonstrated, on Oct. 21, 1879, and in advance of contemporaneous workers, an incandescent lamp whose resistance, current consumption, life and cost made its use commercially practicable. From that lamp it can well be said the real beginning of the electrical industry, with its great contributions to human welfare, dates.

Consolidations in the Electric Utility Industry

No Development in the Economics of Our Business Should Be Permitted to Obscure Our Desire, Our Willingness and Our Interest to Carry on in Accordance with the Public Interest

By M. S. SLOAN
President, National Electric Light Association

LIKE other large business, the power and lighting industry is now in the midst of a period of reorganization into larger units. Operating companies in our industry are being merged, and holding companies are being combined into bigger ones or grouped together under common control. The reasons for this are the same with us as the reasons which are back of similar developments all over the business world. Conditions of American business life have changed, and methods and machinery have had to change in accordance with those changed conditions. Mass production, mass merchandising and vast capital requirements make necessary business set-ups on a different scale from those existing before the World War. The demands of today on business are great. Great business organizations are necessary to meet these demands properly.

Mergers and combinations of companies are undertaken in order to produce and permit economy in raising new capital, to bring about economies and betterments in operation, to stimulate the marketing of products through unified control and management, or for all of these reasons.

There is sufficient evidence within our industry to prove to us that consolidations and combinations, when wisely conceived and ably administered, do produce the benefits they were formed to bring about. That is the general rule. It need not always be true, and perhaps has not been in every instance. It has been so true in general, however, that to us it justifies what is now taking place on a broad scale, and what seems destined to continue within our industry.

This address was given before the Great Lakes Division, N.E.L.A., Convention, held at French Lick Springs, Ind., Sept. 26-28.

This state of affairs is not clear to the public, either as to our own business or others. There is some acceptance of it as necessary and desirable. There is, on the part of some, a disposition to regard it as inevitable and to hope for the best out of it. There is some downright and outspoken antagonism toward it. Particularly is antagonism evident toward such developments in our industry. It is said that the "power trust" is gobbling up the country. It is alleged that consolidations and combinations are stock jobbing deals, intended only to yield profits to their promoters. It is an oft-voiced fear that the public, our customers, will gain no good out of this situation, but will be victimized in the long run.

The development towards more efficient groupings is an inevitable and logical economic compliance with present day economic conditions. Yet we should be blind if we did not recognize that this development will progress and yield the desired results it is expected to yield only as and when it is understood and accepted by the public, which makes or unmakes business and particularly our business, public utilities. The public will not accept this development in our business on the sole basis that it is necessary and good for us. It will be accepted only as it is proved to be good for the public also. In my judgment it has not yet been so proved to the public's complete acceptance. The public is manifestly suspending judgment.

The development and progressive usefulness of our industry in future is largely dependent on the evolution represented by these mergers and groupings. They are the means, in the main, by which the power and light companies in future will be adequate for their work, as their job of serving the public grows. If this development within our industry should be hampered or checked, we, as individual companies and as an industry, would suffer. The public dependent on our service would also suffer to just the degree to which our companies were handicapped or rendered inadequate in supplying a service constantly being improved, constantly expanding to meet customers' requirements. Such a situation would be lamentable from our selfish point of view as business organizations. It would be lamentable also from the point of view that we are public service organizations charged with the duty of meeting the nation's requirements for electric service.

The present condition of the public mind in respect of this development presents a distinct and serious problem to the power and light industry. We are directly concerned, and we are responsible for the solution of this problem of gaining comprehension of the existing state of affairs and acceptance of it now and for the future. The industry will have to meet this situation. It is, in my judgment, able to meet it beyond question.

The public will accept these mergers and consolidations, will approve and welcome them, in fact, just exactly as soon as it is convinced they are in the public interest as well as in our interest. Benefits to society at large must come out of them as well as benefits to the companies concerned. These must be benefits that can be measured, understood, gossiped about by the rank and file of our customers.

As companies and as an industry we shall be judged, not by what we say or believe about the necessity of this phase of our progress or its benefits, but by results which the public can appreciate. It is up to us to produce such results. As we do this, the size of companies or combinations of companies will make no difference. The public is not worried about size as such, and is not necessarily afraid of the big concern more than the small one. What it wants is assurance that concerns grown huge have not also grown to be regardless of their obligation to the people they serve.

We have, therefore, a duty to the industry and a duty to the public in this situation. These duties coincide, for only by fulfilling our duty to the public can we properly fulfill our duty to the industry. If our companies benefit by consolidations and groupings, our customers also should benefit. If there are savings, the customers should receive their share of them. If the advantages of consolidation yield better operating conditions, larger sales, larger profits, the customers should get their advantages also in more current for less cost to them. This would not be altruism. It would be justice. Moreover, it would be plain business sense. It is now standard business practice in America to make your product as high grade as possible, to sell it at as low a price as possible, and to take the profits from the large volume of sales resulting. The power and light industry is doing that now to a considerable degree and is prospering as a result. The justification of larger units and more concentrated control in our industry will be the measure in which they enable us to extend and accelerate this practice. We shall be judged by results. It is up to us to produce results which speak for themselves.

We have, I believe, a further obligation in the present situation. People are, and I believe have the right to be, apprehensive lest the great combinations formed and forming grow beyond the control which it is deemed essential to have over public service organizations. It is often alleged that regulation of utilities has broken down or has failed to keep pace with changing conditions in the utility field. In New York State there is under way a legislative inquiry into the operation of regulation with a view to strengthening the law and its administration. The results of that investigation will undoubtedly have a far-reaching effect, producing similar undertakings in other states. I do not believe regulation has broken down or failed. What it has accomplished is frequently not understood by its critics, and still less by the general public.

There can be no question among us about the value of public regulation of public utilities. It unquestionably has contributed to the rapid progress of utilities and the improvement of utilities' service. It has been helpful to the utilities in establishing stable conditions for them, under which they could operate intelligently, knowing what they might do and what they might not do. This helped in obtaining the large sums of new capital necessary for our industry's expansion in recent years.

Regulation has been valuable to the public. It affords an orderly procedure for hearing complaints and conducting investigations, and has given assurance to the public against improper practices on the part of the utilities. It has done much for the public by holding the companies to high standards of service. It has been an important element in the establishing of fair and reasonable rates, by which I mean fair and just equally for customers and companies. This has by no means meant reductions in every case. Yet on the whole there has been a general lowering of rates by our industry over a period of years, and I think this may properly be attributed to the conditions set up by regulation.

Nevertheless, regulation, valuable as it unquestionably has been both to the utilities and the public, will be valuable in future only as it accurately and comprehensively reflects conditions which exist. I am sure our industry recognizes this fact. I believe it ought to put this recognition of fact into effect by supporting all wise and well directed efforts to bring laws into conformity with present conditions where they can be shown not to be so, to strengthen them properly, to extend them where extension is found to be necessary. There unquestionably is room for this in some states. I believe our industry can properly stand for stronger regulative commissions, better staffed and better equipped financially to do the job committed to them. There can result from wise, able, expert regulation by state commissions, made up of men who understand their subject, nothing but benefit for the public and the utilities.

Critics of state regulation are particularly outspoken at present in asserting that the public is unprotected, since public utility holding companies have not been brought within the scope of regulation. They clamor for regulation of holding companies. Some of the state commissions also have formally advocated the extension of regulation of operating companies to include regulation of holding companies. Here it seems to me we get into very difficult and debatable ground.

In the first place, just how, under any proposed law, is a holding company to be defined? Is an insurance company or a trust company having large investments in utility securities to be deemed a holding company and regulated? Or, is it to be deemed as being on a par with an individual having investments in utility securities? Is a corporation formed to handle the finances of an individual or family, and investing in utility securities to be deemed a holding company and regulated, or not? If it is to be regulated, how and how much? These are extremes, to be sure, but it is an axiom that proposed regulation must be considered in the extreme of its application.

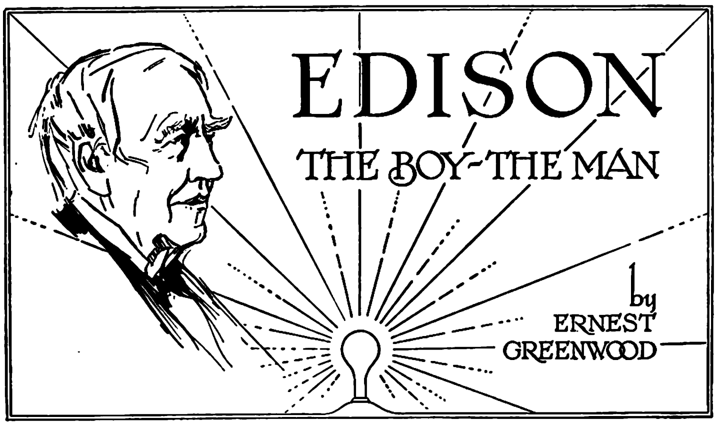
What of the company which is formed to purchase, hold, sell utility securities, which aids operating utilities in their financing, which issues its securities for public purchase, basing them on utility securities it owns? Is this company to be regulated, and if so, how? Is it required in the public interest to be supervised and regulated? Already such securities are carefully scrutinized under the so-called blue sky laws in 37 or 38 states, and must be approved in each state before they can be offered for sale there. And the operating companies, whose securities these holding companies own, are under some degree of supervision and regulation in the states where they are located.

What of the company which owns securities of operating utilities, issues its own securities against them to obtain funds to aid the operating companies in their financing, and which supplies special managerial, engineering, legal and other advice and services? This is the typical holding company as the public understands the term, the company which is supposed to be gobbling up operating utilities and swaying their destinies, though it may or may not have actual stock control of any one of them. Is this company to be regulated, and if so, how? It may have subsidiary companies in many states. Can any one of them exercise jurisdiction over it, or can all of them? To what degree may any one or all of these states exercise jurisdiction, and will such assertion of jurisdiction be uniform or will it vary? Must federal legislation be resorted to? If so, will it interfere with existing state regulation or supersede it? What public benefits will result from transfer of regulation from state to federal jurisdiction? The securities of this holding company, please remember, will be scrutinized and approved under the blue sky laws. Its subsidiary companies will be subject to regulation which obtains in the various states in which they operate. Can more or better supervision be provided?

These are all questions which will have to be resolved if any attempt at regulation of holding companies is made, and there are many others which only a lawyer could discuss, and over which lawyers, I am certain, would differ violently. It is evident that whether or not it is necessary for the public interest to undertake regulation of holding companies, the doing of it would be far from easy. Yet the situation confronts our industry.

It seems to me to be one which we should not shy away from. We should participate freely and frankly in any attempt to resolve these questions in the public's interest and in our own interest as an industry. For only thus will public understanding be gained and suspicion be abated.

Our industry can progress in future and develop to its maximum usefulness only as it possesses the confidence of the public. Our record in improving standards of service, in extending service to new customers and new territories, in reducing prices as efficiency and growth of business have permitted, has been impressive. That record, I am sure, will be continued. But as Owen Young so truly warned us a few years ago, the industry's progress must not be allowed to outstrip public understanding of it. No development in the economics of our business should be permitted to obscure our desire, our willingness and our intent to carry on in accordance with the public interest, and under such public control as a wise and informed public sentiment imposes on us.



N. E. L. A.

announces the publication of a life of

EDISON

By ERNEST GREENWOOD

(*author of Aladdin, U. S. A., Prometheus, U. S. A., and the "Behind the Veil" series now running in the* N. E. L. A. BULLETIN.)

WRITTEN in language that the boy and girl of grammar school age can readily grasp, the book also makes fascinating reading for the mature. It gives the high points of Edison's career, his inventions, his character and personality, from the time of the "weakly appearing" lad of five or six suspected of having "brain trouble" to the present, when all the world is celebrating his invention of the first practical incandescent lamp. 64 pages, 37 illustrations.

Behind the Veil

Corralling the Incandescent Lamp

By ERNEST GREENWOOD

The seventh of a series of articles portraying, against a social-historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

WHEN was the incandescent lamp invented? If Edison didn't invent it, who did? And, if Edison didn't invent the incandescent lamp, what did he invent in 1879 that has caused almost the whole world to unite in celebration of Light's Golden Jubilee in his honor, and why was he given a Congressional medal, and what is it all about, anyhow?

It has never been claimed that Edison was the first man to make an incandescent lamp. In fact, the principle had been established by several experimenters many years prior to 1879—some of them before he was born. But in order to establish just what contributions Edison made to artificial lighting by electricity, it will be necessary to trace the history of incandescent lighting so that it will be proved conclusively—and it can be proved—that without his inventions during the period of 1879 to 1882 this form of lighting might have been for many years, or might have remained forever, nothing but an interesting laboratory experiment.

Most of the literature on this subject goes back no further than 1841, when the essential ideas of an incandescent light were described by De Moleyns, who, in that year, patented in England a crude electric lamp in which a platinum wire, to be rendered incandescent by an electric current, was inclosed in a glass bulb in which the air had been partially exhausted. But as early as 1802, Sir Humphrey Davy, who has been given the credit for the discovery of the arc light, gave several lectures before the Royal Society, and, incidentally, demonstrated that electricity would heat thin strips of metal to a white heat, causing them to oxidize so rapidly in the air that they literally burned up. Platinum, he found, would not oxidize so readily, so that it could be heated to a white heat and give light for a considerable length of time. This was undoubtedly the forerunner of the incandescent lamp.

The earliest record of any attempt to actually make an incandescent lamp was in 1820, when De la Rue made a lamp with a coil of platinum wire inclosed in a piece of glass tubing, the ends of which were capped with brass. It was supposed to have a partial vacuum, but how this was accomplished has never been made clear. It should be remembered that even up to the present a perfect vacuum never has been achieved, so we use the term vacuum only to indicate partial exhaustion of air. In any event, the basic principle was the same as that of the incandescent lamp today—a burner or "filament" inclosed in a partial vacuum and heated to incandescence by an electric current. The difficulty was with the "filament." Platinum only becomes incandescent at a temperature which is very close to its melting point, and at this temperature it disintegrates rapidly. Furthermore, in those days the only electric current available was from batteries, and the cost would have made the operation of any such lamp prohibitive. The De la Rue lamp is of historic value only.

The original EDISON paper horseshoe filament lamp used in the historic demonstration of the Edison Electric Light at Menlo Park, N. J., Oct. 21, 1879

In 1840, Sir William Grove gave a lecture before the Royal Society during which he demonstrated his battery by lighting the auditorium with incandescent lamps. These lamps consisted of a coil of platinum wire fastened to the ends of copper wires, the lower part of which were varnished for insulation. The platinum wire burner or "filament" was covered by a glass tumbler to protect it from the air. The open end of this tumbler was set in a glass dish partly filled with water through which the copper wires extended, thereby making a seal which prevented any air, except that already in the glass, from reaching the burner.

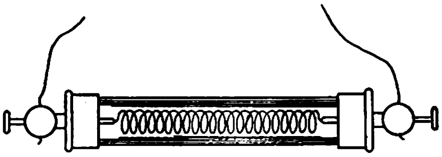
The trouble with this lamp or, in fact, any lamp based on this principle, was the enormous amount of current required to keep the platinum incandescent. Current could be obtained only from batteries at that time, and it has been estimated that the cost of current with Grove's battery was at the rate of several hundred dollars a kilowatt-hour. As a comparison, the present general average retail rate in this country is only a little more than six cents a kilowatt-hour.

The first patent on an incandescent lamp was granted by the British Government to Frederick De Moleyns in 1841. His lamp, which was quite novel, consisted of a spherical glass globe, in the upper part of which was a glass tube containing powdered charcoal. This tube was open at the bottom and through it ran a platinum wire coiled at the end inside the tube. Another platinum wire extended upward from the bottom of the globe, through the tube, and also ended in a coil, the end of which was close to that of the other coil. The powdered charcoal in the glass tube filled the two coils, bridging the gap between them. Current flowing from one platinum wire to the other through this bridge of powdered charcoal made the latter incandescent.

The most interesting of the incandescent lamps which were a product of this period was that devised in 1845 by J. W. Starr, an American living in Cincinnati, and on which he obtained a patent in England. Unfortunately this patent was taken out in the name of his attorney, and it has been asserted that this attorney so manipulated affairs as to keep Starr in the background and deprive him of any reward or credit for this and other inventions that anticipated much valuable work of a later date.

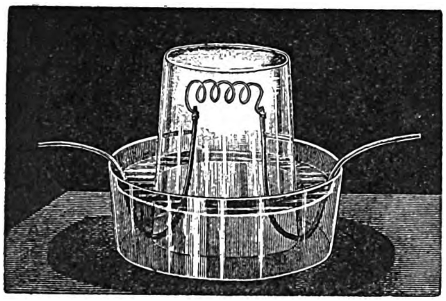
Starr actually invented two incandescent lamps. One consisted of a strip of platinum, the active length of which could be adjusted to fit the strength of the battery used so that the burner would operate at the proper temperature. It was covered by a glass globe to protect it from the air. The other lamp consisted of a carbon rod operating in a vacuum above a column of mercury. A platinum wire was sealed in the upper end of a tubular glass bulb, inside of which was a thin slab of carbon attached to the platinum wire by an iron clamp. The lower end of the carbon slab was attached by another iron clamp to a long copper wire. Fused to the bottom end of the tubular glass bulb was a narrow glass tube, open at the end, and a little over thirty inches in length, into which the copper wire extended. The bulb with its extended glass tube was filled with mercury and set in a dish containing mercury, so that part of the mercury ran out of the bulb until the top of the mercury column came to rest in the tube at about thirty inches above the surface of the mercury in the dish, as it does in a mercury barometer. This lamp was impractical, however, as it is known that such a vacuum as was caused in the tube contains water vapor, and that when the lamp is lighted, the heat will drive gases out of the glass, the carbon rod, iron clamps, etc., which will cause the glass to blacken rapidly.[1]

Unfortunately Starr died on ship board while returning to the United States. As early as 1844, however, he had called attention to his apparatus in an article in the Cincinnati *Advertiser* and proposed to install on high towers some lamps that would "enable a light to be diffused all over Cincinnati equal for practical purposes to that of daylight." His lamp is said to have given an excellent light and involved the essential elements of incandescent lamps of the present day.[2]



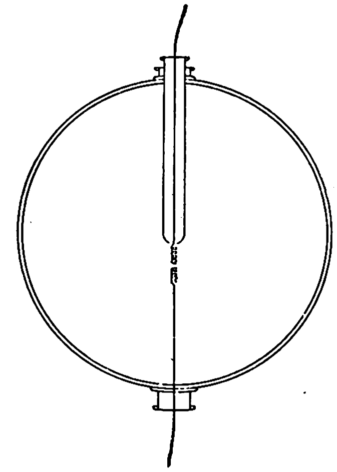
De La Rue's Incandescent Lamp, 1820

In this lamp, the first on record, a platinum wire operated in partial vacuum.



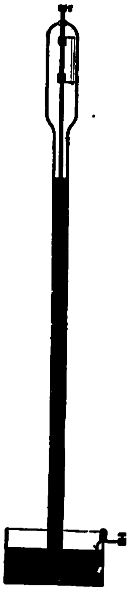
Grove's Incandescent Lamp, 1840

A coiled platinum wire burner was covered by a glass tumbler surrounded by water in glass dish.



De Moleyns' Incandescent Lamp, 1841

The first lamp on which a patent (British) was granted. Lamp contained powdered charcoal which filled and bridged the gap between two coils of platinum wire mounted in a globe from which air had been exhausted.



Starr's Carbon Lamp, 1845

This consisted of a carbon rod operating in partial vacuum above a column of mercury.

During the next few years a number of inventors tried to make incandescent lamps, in spite of the fact that their use with current from batteries would make them impractical because of the cost. The dynamo was being improved, but was still impractical commercially. In 1848, W. E. Staite made a lamp having a burner consisting of platinum and iridium operating in the air, but covered by a glass globe. In 1850, Edward C. Shepard made a lamp consisting of a weighted charcoal cylinder pressing against a charcoal cone in a partial vacuum. M. J. Roberts, in 1852, made a lamp having a graphite rod operating in a partial vacuum. In 1856, DeChangy, a French civil engineer, obtained a Belgian patent on a lamp having a coiled platinum wire for the burner which operated in air, but was covered by a glass tube to protect it from draughts. In 1859, Professor Moses G. Farmer, of the Naval Training Station at Newport, Rhode Island, made a lamp, several of which were used to light the parlor of his home. This lamp consisted of a strip of sheet platinum operating in air, the novel feature being that the strip was narrower at the ends than at the middle, causing it to be more uniformly incandescent. He obtained a United States patent on this feature many years later (1882). In fact, lamps were devised by scores of inventors, but most of them were little more than toys.

This brings us up to the work of Sir Joseph W. Swan, whom our English cousins claim is the real inventor of the incandescent lamp. In fact, Great Britain had a Light's Golden Jubilee all its own in 1928 in honor of the fiftieth anniversary of the incandescent lamp invented by Swan. It is, therefore, of some importance that the history of his work be reviewed with care if we are to actually determine who was the inventor of the first practical lamp based on the principle of incandescence.

Sir Joseph eventually became one of the foremost manufacturers of incandescent lamps in England. At various times, from 1848 to 1860, he made a number of experimental lamps, all of them consisting of carbonized strips and spirals of paper and cardboard, coated with various liquids, which, on being heated, left a large residue of carbon. These lamps were operated in partial vacuum, either in a glass bottle having a wide neck closed with a rubber stopper through which the connecting wires passed, or in a glass bell whose rim made a tight fit within the rim of a brass plate through which one insulated connecting wire passed, the plate being used as the other connection. Due partly to some trace of the air being left within the glass container, and partly to the carbons becoming distorted, the lamps soon broke down.[3]

According to an article entitled "Brief Personal Recollections in Connection with the Jubilee of the Invention of the Carbon Incandescent Lamp by Sir Joseph Swan in 1878," by V. A. Fleming, D.Sc., F.R.S., appearing in the *Journal of the Institution of Electrical Engineers* (Great Britain), "there was no inducement to continue these experiments until the invention of the dynamo and alternator had rendered possible the mechanical production of electric current. The improvements in arc lighting made in the early part of the decade 1870 to 1880 and the production of arc lamps carbons by F. P. E. Carre in 1876 stimulated attention once more to the problem of incandescent lighting. Sometime between 1876 and the middle of 1878 Swan must have turned his mind again to this subject." But what really happened?

One of the most important problems in connection with a practical incandescent lamp was that of securing a suitable vacuum within the glass bulb. In 1865, Herman Sprengel, by his invention of the mercury vacuum pump, was able to get a vacuum far superior to any previously attainable. In 1875, Crookes (afterward Sir William Crookes) astonished the world by the exhibition of his radiometer[4] and the description of the improved means he employed, in connection with the Sprengel pump, for obtaining the near approach to the perfect vacuum which the construction of the radiometer demanded. It was the publication of this paper which led Sir Joseph Swan to resume his incandescent lamp experiments.

In 1877, through a chance advertisement about radiometers, Swan got a young bank clerk to assist him in carrying out these experiments. Again referring to the article by Mr. Fleming, we are told: "Swan seems to have procured some very slender rods of carbon, prepared, I think, though I am not sure, by the Carre process, and attached to the end of one of these platinum wires by means of which he was enabled to seal it vacuum tight in a bulb wholly of glass and exhausted of its air, so that the carbon could be made incandescent in a high vacuum. Thus he produced the lamps used at his lecture on the 18th of December 1878, and one of these, as I have stated above, is now to be seen in the National Science Museum, London."

This, apparently, is the lamp on which our British friends base their claims that Swan was the inventor of the incandescent lamp. Turning to the "History of the Incandescent Lamp," by Howell and Schroeder, we find that "notwithstanding the fact that the lamp bulb had been highly evacuated, the vacuum rapidly deteriorated owing to the evolution of gases from the carbon, which took place as soon as the current was turned on. The difficulty was overcome by heating the bulb by a flame from the outside and then passing a strong current through the carbon to make it brilliantly incandescent *while it was still connected to the exhaust pump.* The straight carbon wires were found to buckle and so did not last, but the arch-shaped carbon wires gave good results."

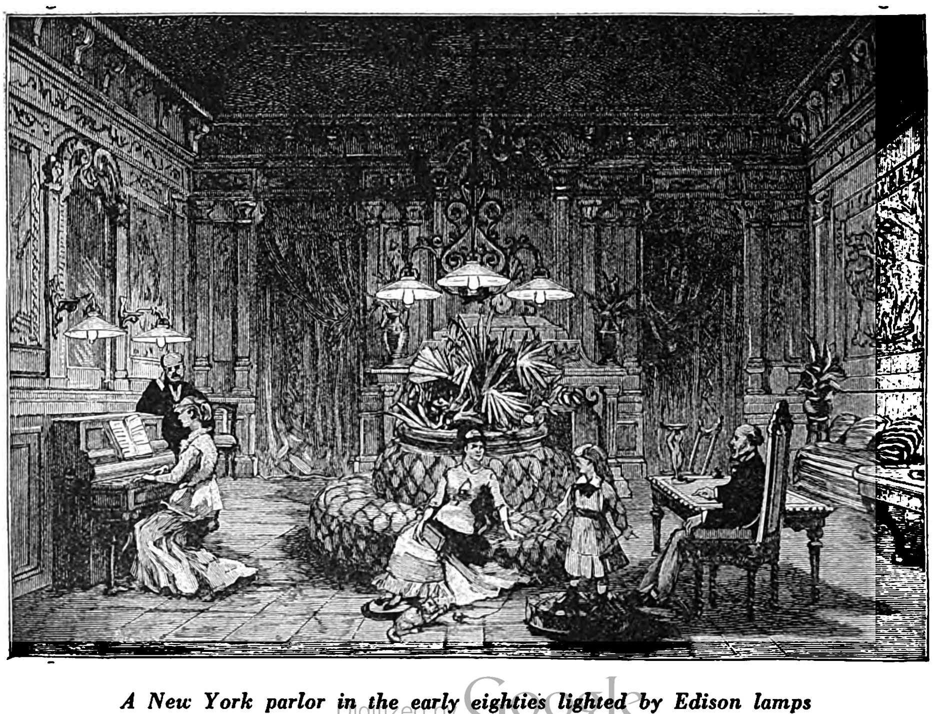
It is submitted that, while Swan at this time was making material contributions to the art of incandescent lighting, he had no more found a practical lamp than had Grove in 1840, or De Moeylns in 1841, or Starr in 1845, or any of the other of the innumerable inventors who experimented between 1820 and 1879.

Again returning to the article by Mr. Fleming, we find this statement: "*Early in* 1880, Swan devised an improvement upon the form of carbon conductor which he used in his 1878 lamp. He had evidently recognized that carbon could not be obtained in so suitable a form by cutting down a large mass of carbon as by carbonizing some organic material already in filamentary form. The material which he used for this purpose in his first form of practical lamp was cotton thread parchmentized by treatment with sulphuric acid and then carbonized by heating to redness *when packed in a crucible with carbon powder.*" I have italicized the date and the last few words of the past sentence because of their significance.

To the above statements Mr. Fleming adds: "Toward the middle, or close, of 1879, Swan and Stearn became aware that Edison had abandoned the use of metallic wires and had applied for patents for an incandescent lamp containing a 'filament' of carbon." This statement is also significant.

What was Edison doing all this time? In 1877, he and three other men were attacking the problem which was then popularly called "sub-dividing the electric light." William E. Sawyer produced a lamp which had a graphite burner operating in nitrogen gas. Professor Moses G. Farmer also devised a lamp consisting of a graphite rod operated in nitrogen gas. Hiram S. Maxim, well known for his later invention of the rapid fire gun, made two lamps, one consisting of a piece of sheet platinum operating in air and the other consisting of a graphite rod operating in rarefied hydrocarbon vapor and protected from excessive current by an electro magnet which short-circuited the graphite burner. Edison was the only one of the four who really solved the problem.

He first began his study of the incandescent lamp problem in the fall of 1877. None of the early work had left any permanent results and the "commercial sub-division of electric lighting" had been set down as impracticable by some of the foremost scientific authorities up to the very moment he produced his first lamps and used them for illuminating



A New York parlor in the early eighties lighted by Edison lamps purposes. He followed his usual procedure of checking and confirming the failure of others so that he might, so to speak, start with a clean slate. At this time he had a well-equipped laboratory at Menlo Park, with several able assistants and a considerable number of workmen. He had already made several important inventions, including the quadruplex telegraph, the carbon telephone transmitter, and the phonograph. He was eminently fitted to tackle the problem of the incandescent lamp.

---

[3] See "The History of the Incandescent Lamp."

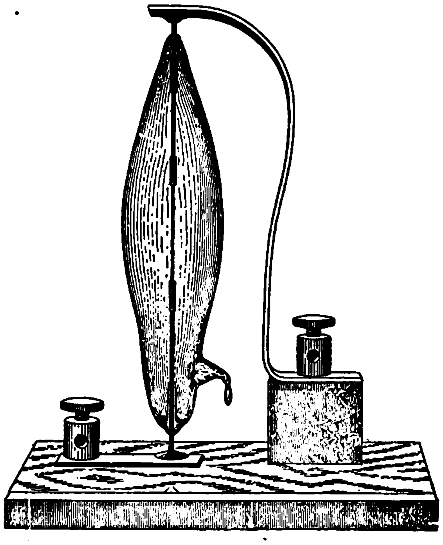
[4] The radiometer is an instrument for detecting and measuring radiant energy by converting it into mechanical energy.

Edison's experiments on carbon as a material for use in electric work began in 1876, but almost at the very beginning he became satisfied that this material was impractical for the incandescent burner and he started investigating platinum. He developed a lamp having a platinum spiral for a burner, on which a patent was granted in April, 1879, but he had been experimenting with strips of carbonized paper as an incandescent conductor as early as the fall of 1877, continuing along this line until January, 1878, and resuming again in the fall of that year.

Early in 1879, Edison realized that the solution of the problem to which he had set his hand would not be found merely in the production of a durable incandescent lamp—even if any of the lamps he had made up to that time had fulfilled that requirement. The other principal features necessary to sub-divide the electric current successfully were the burning of an indefinite number of lights on the same circuit, each light to give a useful and economical degree of illumination, and each light to be independent of all the others in regard to its operation and extinguishment.

What were the scientific men in England thinking about such a project early in 1879? About February of that year, Mr. (Sir) W. H. Preece, one of the most eminent electricians in England, after discussing the question mathematically before the Royal United Service Institution, said: "Hence the sub-division of the light is an absolute *ignis fatuus.*"

Paget Higgs, LL.D., D.Sc., in a book written by him and published in 1879, said: "Much nonsense has been talked in relation to this subject. Some inventors have claimed the power to 'indefinitely divide' the electric current, not knowing or forgetting that such a statement is incompatible with the well proven law of conservation of energy." The eminent scientist, John Tyndall, delivered a lecture before the Royal Institution on "The Electric Light" (January 17, 1879), when, after pointing out the development of the art up to Edison's work, and showing the apparent hopelessness of the problem, he said: "Knowing something of the intricacy of the practical problem I should certainly prefer seeing it in Edison's hands to having it in mine."

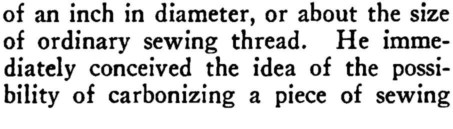


Swan Incandescent Lamp of 1878

Turning back, for the sake of emphasis, we again note that Swan's lamp of 1878 had been discarded as commercially impracticable, as had all other incandescent lamps which had preceded it during a period of nearly 60 years, and that toward the close of 1879 he "became aware" that Edison had abandoned the use of metallic wires and had applied for a patent on a lamp containing a "filament" of carbon, and that in 1880 he was still working on improvements on the carbon conductor. English scientists were almost unanimously agreed that the sub-dividing of the electric current which would make incandescent lighting commercially practical was an almost hopeless problem.

Edison had done a lot of experimenting with different forms of carbon for his telephone receiver and knew that it had a high resistance compared with platinum. He also realized that to get the requisite resistance for incandescent lamps, the carbon would have to be very slender. Thick carbon rods did not last long when subjected to the high temperature of incandescence.

So his first problem was that of obtaining carbon of the requisite slenderness, and of determining what its length and diameter should be. After considerable calculation, he estimated that the carbon should not be over a sixty-fourth of an inch in diameter, or about the size of ordinary sewing thread. He immediately conceived the idea of the possibility of carbonizing a piece of sewing thread by heating it in an air-tight crucible. He cut several pieces of thread, packed them with carbon in an earthenware crucible in U-shaped form, and heated them in a furnace to a high temperature for several hours. After many trials he obtained an unbroken carbonized thread, or "filament," which then had to be fastened to a pair of platinum wires. This was finally done after many failures. The filament was inserted in a glass bulb and the neck of the bulb sealed, the lamp being connected with a mercury pump and the air exhausted. What happened after that is told in an interesting way in "The History of the Electric Lamp."



Swan Lamp of later period

"The crucial time had come to try the lamp out. The men in the laboratory were skeptical about it and bets were made that it would last but a few minutes. With a crowd about him, Edison turned the current on gradually by means of external resistance until the filament glowed dimly. It did not burn out. Becoming bold, he gradually cut out the resistance until the lamp gave a brilliant light. Still it did not burn out. It continued to burn, and when evening came it was still going strong. This was *October* 21, 1879, and the lamp burned steadily for nearly two days.

"Edison now felt that he was on the right track, and everything conceivable was carbonized in the endeavor to make a better filament. After many weeks of working almost day and night, he found that carbonized paper (bristol board) would give several hundred hours' life. He then felt that he had a practical lamp which could be commercially used, so he decided to announce his invention and demonstrate it to the public.

"The announcement was made in an article which took the entire first page of the *New York Herald* of Sunday, December 21, 1879. Several scientists proclaimed Edison's invention to be a fake. Gas stocks, however, dropped in price and stock in the Edison Electric Light Company (which had been organized for the purpose of backing Edison in his work) soared to thirty-five hundred dollars a share.

"The demonstration consisted of about sixty lamps mounted on poles lighting the laboratory grounds and country roads in the neighborhood. Wires were also run to several houses and lamps installed in them. Crowds came out to Menlo Park during the next few days and the Pennsylvania Railroads had to run special trains to accommodate them."

Once more calling attention to comparative dates, Mr. Edison's first lamp, which burned for more than 40 hours, was demonstrated to his laboratory assistants on October 21, 1879. His first public demonstration was given about

December 20, 1879. He applied for a patent on this lamp on November 4, 1879, and the patent was granted on January 27, 1880. Sir Joseph turned his attention to carbonized organic material after he heard that Edison had abandoned the use of metallic wires and carbon pencils. He gave the first public demonstration of his lamp, according to Mr. Fleming, on October 20, 1880, and applied for a British patent early in that year. He organized a company known as the "Swan Electric Light Company" in February, 1881, for the purpose of manufacturing his lamps, while Edison had made his first commercial installation, on the steamship Columbia of the Oregon Railway and Navigation Company, on May 2, 1880. The plant on this ship was a complete success, running for fifteen years, when the ship was overhauled and a more modern plant installed. The first Edison lamp factory went into operation late in 1880. It is interesting to note that the Edison and Swan interests in England combined in 1883 under the name of *The Edison and Swan Electric Light Company, not* under the name of the Swan and Edison Electric Light Company.
